Great Captains with their guns & drums
Disturb our judgment for the hour;
But at last silence comes:

These are gone, &, standing like a tower,
Our children shall behold his fame,
The kindly - earnest, brave, foreseeing man,
Sagacious, patient, breathing praise not blame,
A son of our new soil, the first American.

ABRAHAM LINCOLN: A HISTORY.*

By JOHN G. NICOLAY AND JOHN HAY, PRIVATE SECRETARIES TO THE PRESIDENT.

EDITORIAL PREFACE.

THE CENTURY MAGAZINE has never entered upon a more important enterprise, nor one in which we have been surer of the sympathy and support of the public, than in engaging to present in these pages the first full and authoritative biography of Abraham Lincoln, together with a history of the times in which he lived. It is hardly necessary to explain that this long-expected history is by no means solely a sifting and re-editing of already printed records and memorials. Its originality is, however, especially notable in its account of Lincoln's administration, in dealing with which will be given to the world important details that have hitherto remained unrevealed, in order that they might first appear in their proper connection in this monumental work.

The advantages enjoyed by the writers of this history are not only incomparably greater than those possessed by any predecessors, but they are also beyond the reach of any future historian. Both of these biographers grew up in the same region with Mr. Lincoln; they were intimate from boyhood with his friends and companions. Mr. Nicolay took charge of his correspondence before his election to the Presidency, and the very first commission Lincoln signed as President was that of Mr. Nicolay to be his official Private Secretary. He held this position throughout Mr. Lincoln's term of office, and enjoyed his closest intimacy and confidence. Mr. Hay, like Mr. Nicolay, accompanied the President from Springfield to Washington, where he remained several years as Assistant Secretary; he then entered the army as an Assistant Adjutant-General of Volunteers, and after a brief period of staff service was ordered back to Washington and assigned to duty as aide-de-camp to the President; where he remained till the war ended. One of them, and generally both, were on duty at Mr. Lincoln's side every day from 1860 to 1865; Mr. Nicolay was his official medium of communication with Congress and the Cabinet; both were continually employed by him in delicate and important missions to every part of the country; both stood beside him at his two inaugurations; one saw him die.

During all these years of official service at the Executive Mansion, the authors cherished the idea of writing this history. At an age when the faculties of memory and observation are at their best, they made frequent notes and memoranda of important events occurring about them. The President was himself aware of their intention, and encouraged and assisted them in their work. Some of his most precious manuscripts were given them by his own hand. Their notes and memoranda taken during the war fill several manuscript volumes, the value of which, from an historical point of view, is inestimable.

After the war was over, and the triumph of the national arms had received its pathetic

* Copyright by J. G. Nicolay and John Hay, 1886. All rights reserved.

and tragical consecration in the martyrdom of the President, they did not take advantage of the excitement of the hour to throw upon the world a hasty and ill-digested compilation to meet the temporary demand. After spending five years in Europe in the public service, they returned to this country with their impression of the magnitude of the work, which they regarded as assigned to them, broadened and deepened by larger acquaintance with the world. For the last sixteen years they have given most of their time to the collection and arrangement of the enormous material at their disposition. In the first place, all the manuscripts, of whatever nature, belonging to the estate of Mr. Lincoln were absolutely and unreservedly placed in their hands by the Honorable Robert T. Lincoln, the only surviving member of the President's family. In addition to this, they sought and obtained access to the private papers and correspondence of most of Mr. Lincoln's Cabinet. Being on terms of intimacy with all the leading statesmen and generals of the time, they were afforded by them every possible assistance in the elucidation of difficult points. Their residence in Washington, Mr. Nicolay as Marshal of the Supreme Court, and Mr. Hay as Assistant Secretary of State, brought them into constant contact with the most authoritative and valuable sources of information. They have used all these opportunities with the utmost assiduity. They have also profited by the vast quantity of reminiscences, letters, and newspaper articles which have recently been printed in regard to Lincoln and his times. They have considered no chapter of their work completed until it should be printed, and have held themselves ready to accept and use every new fact of importance, from whatever source it might come, whether it confirmed or conflicted with opinions previously entertained.

In the course of their work, besides the mass of manuscript archives in all the departments, they have consulted thousands of printed volumes. Through the kindness of four successive Secretaries of War, they have had free and constant access to the vast accumulation of military reports, from both Union and Confederate officers, in the War Department, and Colonel Robert N. Scott has given them the benefit of his friendly and intelligent coöperation.

In determining the scope and character of their work, the authors were governed by two simple ideas. The first, which was biographical, was to draw the portrait and character of the man Abraham Lincoln, and in doing this succinctly to narrate his actions. The second was historical, and required them to relate the national events of which he was the personal and official center and the inspiring and directing leader. These chapters, therefore, are not mere books of anecdote and reminiscence; they are blended biography and history, written with all the literary skill of which the authors are capable (a skill abundantly proved in their other writings), and compiled with all the historical accuracy which their unusual command of facilities and opportunities made possible. Their field embraced that picturesque period of Western pioneer life in which Mr. Lincoln was born and grew to manhood; then the stirring ten years' agitation during which the nation went through the severe and bitter struggle over the slavery question, and which brought on the rebellion; finally, the intensely moving drama of the American civil war. When, however, the military portion of this history is reached in magazine publication, care will be taken to avoid as much as possible the repetition of details already given in *THE CENTURY'S* war series, while fully presenting that part of the military narrative in which is explained the relation of the President to these events.

Giving their plan ample breadth to cover this entire field, the authors have, nevertheless, been careful to confine it to such principal personages and events as might find place in a single historical picture, composed with entire dramatic unity, with related and dependent incidents, and with continuity and proper sequence of narrative. Under their lucid statement and explanation, the great historical drama of the American rebellion becomes coherent and intelligible, permitting the reader to understand its beginnings and to follow its development through sectional rivalry and jealousy to conspiracy, disunion, and insurrection; to civil war; to the mighty conflict of the greatest of modern armies in march, manœuvre, siege, and battle. Finally, at the moment when the Union armies triumph, and their victory ordains that the Constitution shall stand and the nation remain one, the story comes back to that crowning catastrophe of the drama which, with a climax as emotional as any creation of fancy, once more lifts the personal above the historic interest and records a sorrow extending far beyond the boundaries of the nation, and touching the civilized world not alone with regret at the loss of a benefactor to humanity, but as if with the bereavement of a near and dear friend.

AUTHORS' PREFACE.

GENERATION born since Abraham Lincoln died has already reached manhood and womanhood. Yet there are millions still living who sympathized with him in his noble aspirations, who labored with him in his toilsome life, and whose hearts were saddened by his tragic death. It is the almost unbroken testimony of his contemporaries that by virtue of certain high traits of character, in certain momentous lines of purpose and achievement, he was incomparably the greatest man of his time. The deliberate judgment of those who knew him has hardened into tradition; for although but twenty-one years have passed since he fell by the bullet of the assassin, the tradition is already complete. The voice of hostile faction is silent, or unheeded; even criticism is gentle and timid. If history had said its last word, if no more were to be known of him than is already written, his fame, however lacking in definite outline, however distorted by fable, would survive undiminished to the latest generations. The blessings of an enfranchised race would forever hail him as their liberator; the nation would acknowledge him as the mighty counselor whose patient courage and wisdom saved the life of the Republic in its darkest hour; and illuminating his proud eminence as orator, statesman, and ruler, there would forever shine around his memory the halo of that tender humanity and Christian charity in which he walked among his fellow-countrymen as their familiar companion and friend.

It is not, therefore, with any thought of materially adding to his already accomplished renown that we have written the work which we now offer to our fellow-citizens. But each age owes to its successors the truth in regard to its own annals. The young men who have been born since Sumter was fired on have a right to all their elders know of the important events they came too late to share in. The life and the fame of Lincoln will not have their legitimate effect of instruction and example unless the circumstances among which he lived and found his opportunities are placed in their true light before the men who never saw him.

To write the life of this great American in such a way as to show his relations to the times in which he moved, the stupendous issues he controlled, the remarkable men by whom he was surrounded, has been the purpose which the authors have diligently pursued for many years. We can say nothing of the result of our labor; only those who have been similarly employed can appreciate the sense of inadequate performance with which we regard what we have accomplished. We can only claim for our work that we have devoted to it sixteen years of almost unremitting assiduity; that we have neglected no means in our power to ascertain the truth; that we have rejected no authentic facts essential to a candid story; that we have had no theory to establish, no personal grudge to gratify, no unavowed objects to subserve. We have aimed to write a sufficiently full and absolutely honest history of a great man and a great time; and although we take it for granted that we have made mistakes, that we have fallen into such errors and inaccuracies as are unavoidable in so large a work, we promise there shall not be found a line in all these chapters dictated by malice or unfairness.

Our desire to have this work placed under the eyes of the greatest possible number of readers induced us to accept the generous offer of THE CENTURY MAGAZINE to print it first in these pages. In this way it will receive the intelligent criticism of a million people, contemporaries of the events narrated, and we expect to profit by the suggestions and corrections which such a method of publication invites. Moreover, as we have endeavored to write this history with a purpose of absolute fairness to every party and every section of the country, we ardently desire that, by its wide dissemination, it may contribute to the growth and maintenance throughout all our borders of that spirit of freedom and nationality for which Abraham Lincoln lived and died.

John G. Nicolay

John Hay

LINCOLN AS PIONEER.

LINEAGE.

IN 1780 Abraham Lincoln, a member of a respectable and well-to-do family in Rockingham County, Virginia, started westward to establish himself with his wife and five children in the newly explored country of Kentucky. He was a man of some substance, possessing at one time a large and fertile tract of land about eight miles north of Harrisonburg. It seemed for many years impossible to ascertain how he lost, or what were the motives which induced him to abandon this valuable property. The records belonging to that portion of the family which remained in Virginia were destroyed in the civil war, and the branch which moved to Kentucky passed through a period of illiteracy which, though it was brief, interrupted the memory and record of their descent. There are hundreds of families in the West, bearing historic names and probably descended from well-known houses in the East or in England, which, by passing through one or two generations of ancestors who could not read or write, have lost their connection with the past as effectually as if a deluge had intervened between the last century and this. Even the patronymic is frequently distorted beyond recognition by slovenly pronunciation during the years when reading and writing were lost arts, and by the phonetic spelling of the first boy in the family who learned the use of the pen. There are Lincolns in Kentucky and Tennessee belonging to the same stock with the President whose names are spelled "Linkhorn" and "Linkhern."

All that was known of this emigrant Abraham Lincoln by his immediate descendants was that his progenitors, who were Quakers, came from Berks County, Pennsylvania, into Virginia, and there thrived and prospered. But the investigations of several eager genealogists have since established a strong probability

that he was descended from the Massachusetts family of the same name, who settled about the year 1638 at Hingham, and who came originally from the county of Norfolk in the old country. The first ancestor of this line of whom we have knowledge was Samuel Lincoln, of Norwich, England; he, dying in Hingham, Massachusetts, left a son, Mordecai, whose son, of the same name, removed to Monmouth, New Jersey, and thence to Amity township, now a part of Berks County, Pennsylvania, where he died about 1735, fifty years old. From a copy of his will, recorded in the office of the Register in Philadelphia, we gather that he was a man of considerable property. In the inventory of his effects, made after his death, he is styled by the appraisers "Mordecai Lincoln, Gentleman." His son John received by his father's will "a certain piece of land lying in the Jerseys, containing three hundred acres," the other sons and daughters having been liberally provided for from the Pennsylvania property. This John Lincoln established himself in Rockingham County, Virginia, and had a family of sons, to whom he gave the names which continually recur in the history of the tribe, Abraham, the pioneer mentioned above, Isaac, Jacob, Thomas, and John. Jacob and John remained in Virginia;* the former was a soldier in the War of the Revolution, and took part as lieutenant in a Virginia regiment at the siege of Yorktown.† Isaac went to a place on the Holston River in Tennessee; Thomas followed his brother to Kentucky, lived and died there, and his children then emigrated to Missouri. But with the one memorable exception, none of the brothers or their descendants achieved the slightest distinction. Even the great fame and conspicuousness of the President brought none of his kindred to the light, except his cousin, Robert Lincoln, of Hancock County, Illinois, who became a captain and quartermaster of volunteers. The rest sank into obscurity, where it is impossible, and would be useless, to follow them.

* Soon after Mr. Lincoln arrived in Washington in 1861, he received the following letter from one of his Virginia kinsmen, the only communication which ever came from them. It was written on paper adorned with a portrait of Jefferson Davis, and was inclosed in an envelope emblazoned with the Confederate flag:

TO ABRAHAM LINCOLN, ESQ., *President of the Northern Confederacy*:

SIR,— Having just returned from a trip through Vir-

ginia, North Carolina, and Tennessee, permit me to inform you that you will get whipped out of your boots. To-day I met a gentleman from Anna, Illinois, and although he voted for you he says that the moment your troops leave Cairo they will get the spots knocked out of them. My dear sir, these are facts which time will prove to be correct.

I am, sir, with every consideration, yours respectfully,
MINOR LINCOLN,

Of the Staunton stock of Lincolns.

† Lamon, page 8.

BOONE MONUMENT IN CEMETERY AT FRANKFORT, KENTUCKY.

VIEW OF THE KENTUCKY FROM BOONE'S GRAVE.

It was ten years after the death of the President that his son learned the probable circumstances under which the pioneer Lincoln removed to the West, and the intimate relations which subsisted between his family and the most celebrated man in early Western annals. There is little doubt that it was on account of his association with the famous Daniel Boone that Abraham Lincoln went to Kentucky. The families had for a century been closely allied. By the will of Mordecai Lincoln, to which reference has been made, his "loving friend and neighbor" George Boone was made a trustee to assist his widow in the care of the property. Squire Boone, the father of Daniel, was one of the appraisers who made the inventory of Mordecai Lincoln's estate. One of the numerous Abraham Lincolns married a Miss Anna Boone in 1760.* The intercourse between the families was kept up after the Boones had removed to North Carolina and John Lincoln had gone to Virginia. Abraham Lincoln, son of John, and grandfather of the President, was married in North Carolina. The inducement which led him to leave Virginia, where his standing and his fortune were assured, was, in all probability, his intimate family relations with the great explorer, the hero of the new country of Kentucky, the land of fabulous richness and unlimited adventure. At a time when the Eastern States were ringing with the fame of the mighty hunter

* A letter from David J. Lincoln, of Birdsboro, Berks County, Pennsylvania, to the writers, says, "My grandfather, Abraham Lincoln, was married to Anna Boone, a first cousin of Daniel Boone, July 10, 1760."

who was then in the prime of his manhood, and in the midst of those achievements which will forever render him one of the most picturesque heroes in all our annals, it is not to be wondered at that his own circle of friends should have caught the general enthusiasm and felt the desire to emulate his career.

Boone's exploration of Kentucky had begun some ten years before Lincoln set out to follow his trail. In 1769 he made his memorable journey to that virgin wilderness of whose beauty he always loved to speak even to his latest breath. During all that year he hunted, finding everywhere abundance of game. "The buffalo," he says, "were more frequent than I have seen cattle in the settlements, browsing on the leaves of the cane, or cropping the herbage on these extensive plains, fearless because ignorant of the violence of man. Sometimes we saw hundreds in a drove, and the numbers about the salt springs were amazing." In the course of the winter, however, he was captured by the Indians while hunting with a comrade, and when they had contrived to escape they never found again any trace of the rest of their party. But a few days later they saw two men approaching and hailed them with the hunter's caution, "Hullo, strangers; who are you?" They replied, "White men and friends." They proved to be Squire Boone and another adventurer from North Carolina. The young Boone had made that long pilgrimage through the trackless woods, led by an instinct of doglike affection, to find his elder brother and share his sylvan pleasures and dangers. Their two companions were soon waylaid and killed, and the Boones spent the long winter in that mighty solitude undisturbed. In the spring their ammunition, which was to them the only necessary of life, ran low, and one of them must return to the settlements to replenish the stock. It need not be said which assumed this duty; the cadet went uncomplaining on his way, and Daniel spent three months in absolute loneliness, as he himself expressed it, "by myself, without bread, salt, or sugar, without company of my fellow-creatures, or even a horse or dog." He was not insensible to the dangers of his situation. He never came to his camp without the utmost precaution, and always slept in the canebrakes if the signs were unfavorable. But he makes in his memoirs this curious reflection, which would seem like affectation in one less perfectly and simply heroic: "How unhappy such a situation for a man tormented with fear, which is vain if no danger comes, and if it does, only augments the pain. It was my happiness to be destitute of this afflicting passion, with which I had the greatest reason to be afflicted." After his brother's return, for a

year longer they hunted in these lovely wilds, and then returned to Yadkin to bring their families to the new domain. They made the long ride back, five hundred miles, in peace and safety.

For some time after this Boone took no conspicuous part in the settlement of Kentucky. The expedition with which he left the Yadkin in 1773 met with a terrible disaster near Cumberland Gap, in which his eldest son and five more young men were killed by Indians, and the whole party, discouraged by the blow, retired to the safer region of the Clinch River. In the mean time the dauntless speculator Henderson had begun his occupation with all the pomp of viceroyalty. Harrodsburg had been founded, and corn planted, and a flourishing colony established at the Falls of the Ohio. In 1774 Boone was called upon by the Governor of Virginia to escort a party of surveyors through the State, and on his return was given the command of three garrisons; and for several years thereafter the history of Kentucky is the record of his feats of arms. No one ever equaled him in his knowledge of Indian character, and his influence with the savages was a mystery to him and to themselves. Three times he fell into their hands and they did not harm him. Twice they adopted him into their tribes while they were still on the war-path. Once they took him to Canada, to show the Long-Knife chieftains of King George that they could also exhibit trophies of memorable prowess, but they refused to give him up even to their British allies. In no quality of wise woodcraft was he wanting. He could outrun a dog or a deer; he could thread the woods without food day and night; he could find his way as easily as the panther could. Although a great athlete and a tireless warrior, he hated fighting and only fought for peace. In council and in war he was equally valuable. His advice was never rejected without disaster, nor followed but with advantage; and when the fighting once began there was not a rifle in Kentucky which could rival his. At the nine days' siege of Boonesborough he took deliberate aim and killed a negro renegade who was harassing the garrison from a tree five hundred and twenty-five feet away, and whose head only was visible from the fort. The mildest and the quietest of men, he had killed dozens of enemies with his own hand, and all this without malice and, strangest of all, without incurring the hatred of his adversaries. He had self-respect enough, but not a spark of vanity. After the fatal battle of the Blue Licks,—where the only point of light in the day's terrible work was the wisdom and valor with which he had partly retrieved a disaster he foresaw

LAND WARRANT ISSUED TO ABRAHAM LINKHORN (LINCOLN), SLIGHTLY REDUCED. ORIGINAL IN POSSESSION OF R. T. DURRETT, ESQ., LOUISVILLE, KY. (SEE OPPOSITE PAGE.)

but was powerless to prevent,—when it became his duty, as senior surviving officer of the forces, to report the affair to Governor Harrison, his dry and naked narrative gives not a single hint of what he had done himself, nor mentions the gallant son lying dead on the field, nor the wounded brother whose gallantry might have justly claimed some notice. He was thinking solely of the public good, saying, “I have encouraged the people in this country all that I could, but I can no longer justify them or myself to risk our lives here under such extraordinary hazards.” He therefore begs his Excellency to take immediate measures for relief. During the short existence of Henderson’s legislature, he was a member of it, and not the

* In the possession of Colonel Reuben T. Durrett, of Louisville, Kentucky, a gentleman who has made the early history of his State a subject of careful and intelligent study, and to whom we are greatly indebted for valuable information in regard to the settlement of the Lincolns in Kentucky. He gives the following list of lands in that State owned by Abraham Lincoln:

1. Four hundred acres on Long Run, a branch of Floyd’s Fork, in Jefferson County, entered May 29th, 1780, and surveyed May 7th, 1785.

2. Eight hundred acres on Green River, near Green

least useful one. Among his measures was one for the protection of game.

Everything we know of the emigrant Abraham Lincoln goes to show that it was under the auspices of this most famous of our pioneers that he set out from Rockingham County to make a home for himself and his young family in that wild region which Boone was wresting from its savage holders. He was not without means of his own. He took with him funds enough to enter an amount of land which would have made his family rich if they had retained it. The county records show him to have been the possessor of a domain of some seventeen hundred acres. There is still in existence* the original warrant,

River Lick, entered June 7th, 1780, and surveyed October 12th, 1784.

3. Five hundred acres in Campbell County, date of entry not known, but surveyed September 27th, 1798, and patented June 30th, 1799 — the survey and patent evidently following his entry after his death. It is possible that this was the five-hundred-acre tract found in Boone’s field-book, in the possession of Lyman C. Draper, Esq., Secretary of the Wisconsin Historical Society, and erroneously supposed by some to have been in Mercer County. Boone was a deputy of Colonel Thomas Marshall, Surveyor of Fayette County.

dated March 4th, 1780, for four hundred acres of land, for which the pioneer had paid "into the publick Treasury one hundred and sixty pounds current money," and a copy of the surveyor's certificate,* giving the metes and bounds of the property on Floyd's Fork, which remained for many years in the hands of Mordecai Lincoln, the pioneer's eldest son and heir. The name was misspelled "Linkhorn"

Washington had acquired claims and patents to the amount of thirty or forty thousand acres of land in the West; Franklin and the Lees were also large owners of these speculative titles. They formed, it is true, rather an airy and unsubstantial sort of possession, the same ground being often claimed by a dozen different persons or companies under various grants from the crown or from legislatures,

Surveyed for Abraham Linkhorn 400 acres of Land in Jefferson County by virtue of a Treasury Warrant No. 3334 on the Fork of Floyd's Fork now called the Long Run beginning about two miles up the said Fork from the Mouth of a Fork of the same formerly called Tins Fork at a Sugar Tree standing on the side of the same marked $\overline{S}B$ and extending thence East 300 poles to a Poplar and Sugar Tree north 213 $\frac{1}{3}$ poles to a Beech and Dogwood West 300 poles to a white Oak and Hickory South 213 $\frac{1}{3}$ poles to the Beginning, May 7th 1785 William Shannon D. by a blunder of the clerk in the land-office, and the error was perpetuated in the subsequent record.

Kentucky had been for many years the country of romance and fable for Virginians. Twenty years before Governor Spotswood had crossed the Alleghanies and returned to establish in a Williamsburg tavern that fantastic order of nobility which he called the Knights of the Golden Horseshoe,† and, with a worldly wisdom which was scarcely consistent with these mediæval affectations, to press upon the attention of the British Government the building of a line of frontier forts to guard the Ohio River from the French. Many years after him the greatest of all Virginians crossed the mountains again, and became heavily interested in those schemes of emigration which filled the minds of many of the leading men in America until they were driven out by graver cares and more imperative duties.

* Jefferson County Records.

† Their motto was *Sic jurat transcendere montes.*

or through purchase from adventurers or Indian councils. But about the time of which we are speaking the spirit of emigration had reached the lower strata of colonial society, and a steady stream of pioneers began pouring over the passes of the mountains into the green and fertile valleys of Kentucky and Tennessee. They selected their homes in the most eligible spots to which chance or the report of earlier explorers directed them, with little knowledge or care as to the rightful ownership of the land, and too often cleared their corner of the wilderness for the benefit of others. Even Boone, to whose courage, forest lore, and singular intuitions of savage character the State of Kentucky owed more than to any other man, was deprived in his old age of his hard-earned homestead through his ignorance of legal forms, and removed to Missouri to repeat in that new territory his labors and his misfortunes.

The period at which Lincoln came west was one of note in the history of Kentucky.

The labors of Henderson and the Transylvania Company had begun to bear fruit in extensive plantations and a connected system of forts. The land laws of Kentucky had reduced to something like order the chaos of conflicting claims arising from the various grants and the different preëmption customs under which settlers occupied their property. The victory of Boone at Boonesborough against the Shawnees, and the capture of Kaskaskia and Vincennes by the brilliant audacity of George Rogers Clarke, had brought the region prominently before the attention of the Atlantic States, and had turned in that

LONG RUN BAPTIST MEETING-HOUSE, BUILT ABOUT 1797 ON THE LAND OF ABRAHAM LINKHORN (LINCOLN). DRAWING FROM MEMORY, IN POSSESSION OF R. T. DURRETT, ESQ.

direction the restless and roving spirit which is always found in communities at periods when great emigrations are a need of civilization. Up to this time few persons had crossed the mountains except hunters, trappers, and explorers,—men who came merely to kill Indians or game, or to spy out the fertility of the land for the purpose of speculation. But in 1780 and 1781 a large number of families took up their line of march, and in the latter year a considerable contingent of women joined the little army of pioneers, impelled by an instinct which they themselves probably but half comprehended. The country was to be peopled, and there was no other way of peopling it but by the sacrifice of many lives and fortunes; and the history of every country shows that these are never lacking when they are wanted. The number of those who came at about the same time with the pioneer Lincoln was sufficient to lay the basis of a sort of social order. Early in the year 1780 three hundred "large family boats" arrived at the Falls of the Ohio, where the land had been surveyed by Captain Bullitt seven years before, and in May the Legislature of Virginia passed a law for the incorporation of the town of Louisville, then containing some six hundred inhabitants. At the same session a law was passed confiscating the property of certain British subjects for the endowment of an institution of learning in Kentucky, "it being the interest of this

commonwealth," to quote the language of the philosophic Legislature, "always to encourage and promote every design which may tend to the improvement of the mind and the diffusion of useful knowledge even among its remote citizens, whose situation in a barbarous neighborhood and a savage intercourse might otherwise render them unfriendly to science." This was the origin of the Transylvania University of Lexington, which rose and flourished for many years on the utmost verge of civilization.

The "barbarous neighborhood" and the "savage intercourse" undoubtedly had their effect upon the manners and morals of the settlers; but we should fall into error if we took it for granted that the pioneers were all of one piece. The ruling motive which led most of them to the wilds was that Anglo-Saxon lust of land which seems inseparable from the race. The prospect of possessing a four-hundred-acre farm by merely occupying it, and the privilege of exchanging a basketful of almost worthless continental currency for an unlimited estate at the nominal value of forty cents per acre, were irresistible to thousands of land-loving Virginians and Carolinians whose ambition of proprietorship was larger than their means. Accompanying this flood of emigrants of good faith was the usual froth and scum of shiftless idlers and adventurers, who were either drifting with a current they were too worthless to withstand, or in pursuit of dishonest gains in fresher and simpler regions. The vices and virtues of the pioneers were such as proceeded from their environment. They were careless of human life because life was worth comparatively little in that hard struggle for existence; but they had a remarkably clear idea of the value of property, and visited theft not only with condign punishment, but also with the severest social proscription. Stealing a horse was punished more swiftly and with more feeling than homicide. A man might be replaced more easily than the other animal. Sloth was the worst of weaknesses. A habitual drunkard was more welcome at "raisings" and "log-rollings" than a known *fainéant*. The man who did not do a man's share where work was to be done was christened "Lazy Lawrence," and that was the end of him socially. Cowardice was punished by inexorable disgrace. The point of honor was as strictly observed as it ever has been in the idlest and most artificial society. If a man accused another of falsehood, the ordeal by fisticuffs was instantly resorted to. Weapons were rarely employed in these chivalrous encounters, being kept for more serious use with Indians and wild beasts, though fists, teeth, and the

gouging thumb were often employed with fatal effect. Yet among this rude and uncouth people there was a genuine and remarkable respect for law. They seemed to recognize it as an absolute necessity of their existence. In the territory of Kentucky, and afterwards in that of Illinois, it occurred at several periods in their transition from counties to territories and states that the country was without any organized authority. But the people were a law unto themselves. Their improvised courts and councils administered law and equity; contracts were enforced, debts were collected, and a sort of order was maintained.

It may be said, generally, that the character of this people was far above their circumstances. In all the accessories of life, by which we are accustomed to rate communities and races in the scale of civilization, they were little removed from primitive barbarism. They dressed in the skins of wild beasts killed by themselves, and in linen stuffs woven by

from freezing too stiff to be put on. The children grew inured to misery like this, and played barefoot in the snow. It is an error to suppose that all this could be undergone with impunity. They suffered terribly from malarial and rheumatic complaints, and the instances of vigorous and painless age were rare among them. The lack of moral and mental sustenance was still more marked. They were inclined to be a religious people, but a sermon was an unusual luxury, only to be enjoyed at long intervals and by great expense of time. There were few books or none, and there was little opportunity for the exchange of opinion. Any variation in the dreary course of events was welcome. A murder was not without its advantages as a stimulant to conversation; a capital trial was a kind of holiday to a county. It was this poverty of life, this famine of social gratification, from which sprang their fondness for the grosser forms of excitement, and their tendency to rough and brutal practical joking.

MAP SHOWING VARIOUS LOCALITIES CONNECTED WITH EARLY EVENTS IN THE LINCOLN FAMILY.

themselves. They hardly knew the use of iron except in their firearms and knives. Their food consisted almost exclusively of game, fish, and roughly ground corn-meal. Their exchanges were made by barter; many a child grew up without ever seeing a piece of money. Their habitations were hardly superior to those of the savages with whom they waged constant war. Large families lived in log huts, put together with wooden pegs, and far more open to the inclemencies of the skies than the pig-styes of the careful farmer of to-day. An early schoolmaster says that the first place where he went to board was the house of one Lucas, consisting of a single room, sixteen feet square, and tenanted by Mr. and Mrs. Lucas, ten children, three dogs, two cats, and himself. There were many who lived in hovels so cold that they had to sleep on their shoes to keep them

In a life like theirs a laugh seemed worth having at any expense.

But near as they were to barbarism in all the circumstances of their daily existence, they were far from it politically. They were the children of a race which had been trained in government for centuries in the best school the world has ever seen, and wherever they went they formed the town, the county, the court, and the legislative power with the ease and certainty of nature evolving its results. And this they accomplished in the face of a savage foe, always alert and hostile, surrounding their feeble settlements, invisible and dreadful as the visionary powers of the air. Until the treaty of Greenville, in 1795, closed the long and sanguinary history of the old Indian wars, there was no day in which the pioneer could leave his cabin with the certainty of not finding it in ashes when he

returned, and his little flock murdered on his threshold, or carried into a captivity worse than death. Whenever nightfall came with the man of the house away from home, the anxiety and care of the women and children were none the less bitter because so common.

The life of the pioneer Abraham Lincoln soon came to a disastrous close. He had settled in Jefferson County, on the land he had bought from the Government, and cleared a small farm in the forest. One morning, in the year 1786, he started with his three sons, Mordecai, Josiah, and Thomas, to the edge of the clearing, and began the day's work. A shot from the brush killed the father; Mordecai, the eldest son, ran instinctively to the house, Josiah to the neighboring fort (Hughes Station) for assistance, and Thomas, the youngest, a child of seven, was left with the corpse of his father. Mordecai, reaching the cabin, seized the rifle, and saw through the loop-hole an Indian in his war-paint stooping to raise the child from the ground. He took deliberate aim at a white ornament on the breast of the savage and brought him down. The little boy, thus released, ran to the cabin, and Mordecai, from the loft, renewed his fire upon the savages, who began to show themselves from the thicket, until Josiah returned with assistance from the stockade, and the assailants fled. This tragedy made an indelible impression on the mind of Mordecai. Either a spirit of revenge for his murdered father, or a sportsmanlike pleasure in his successful shot, made him a determined Indian-stalker, and he rarely stopped to inquire whether the red man who came in range of his rifle was friendly or hostile.

The head of the family being gone, the widow Lincoln soon removed to a more thickly settled neighborhood in Washington County. There her children grew up. Mordecai and Josiah became reputable citizens; the two daughters married two men named Crume and Bromfield. Thomas, to whom were reserved the honors of an illustrious paternity, learned the trade of a carpenter. He was an easy-going man, entirely without ambition, but not without self-respect. Though the

friendliest and most jovial of gossips, he was not insensible to affronts; and when his slow anger was roused, he was a formidable adversary. Several border bullies, at different times, crowded him indiscreetly, and were promptly and thoroughly whipped. He was strong, well knit, and sinewy; but little over the medium height, though in other respects he seems to have resembled his son in appearance.

On the 12th of June, 1806,* while learning his trade in the carpenter shop of Joseph Hanks, in Elizabethtown, he married Nancy Hanks, a niece of his employer, near Beechland, in Washington County.† She was one of a large family who had emigrated from Virginia with the Lincolns and with another family called Sparrow. They had endured together the trials of pioneer life, and their close relations continued for many years after, and were cemented by frequent intermarriage.

Mrs. Lincoln's mother was named Lucy Hanks; her sisters were Betty, Polly, and Nancy; they married Thomas Sparrow, Jesse Friend, and Levi Hall. The childhood of Nancy was passed with the Sparrows, and she was oftener called by their name than by her own. The whole family connection was composed of people so little given to letters that it is hard to determine the proper names and relationships of the younger members amid the tangle of traditional cousinships. Those who went to Indiana with Thomas Lincoln, and grew up with his children, are the only ones which need demand our attention.

There was no hint of future glory in the wedding or the bringing home of Nancy Lincoln. All accounts represent her as a handsome young woman of twenty-three, of appearance and intellect superior to her lowly fortunes. She could read and write,—a remarkable accomplishment in her circle,—and even taught her husband to form the letters of his name. He had no such valuable wedding gift to bestow upon her; he brought her to a little house in Elizabethtown, where he and she and want dwelt together in fourteen feet square. The next year a daughter was born to them, and the next the young carpenter, not finding his work remunerative

* All previous accounts give the date of this marriage as September 23d. This error arose from a clerical blunder in the county record of marriages. The minister, the Reverend Jesse Head, in making his report, wrote the dates before the names; the clerk, in copying it, lost the proper sequence of the entries, and gave to the Lincolns the date which belonged to the next couple on the list.

† The following is a copy of the marriage bond of Thomas Lincoln:

"Know all men by these presents, that we, Thomas Lincoln and Richard Berry, are held and firmly bound unto his Excellency, the Governor of Kentucky, in the just and full sum of fifty pounds current money, to the

payment of which well and truly to be made to the said Governor and his successors, we bind ourselves, our heirs, etc., jointly and severally, firmly by these presents, sealed with our seals and dated this 10th day of June, 1806. The condition of the above obligation is such that whereas there is a marriage shortly intended between the above bound Thomas Lincoln and Nancy Hanks, for which a license has issued, now if there be no lawful cause to obstruct the said marriage, then this obligation to be void, else to remain in full force and virtue in law.

enough for his growing budget, removed to a little farm which he had bought on the easy terms then prevalent in Kentucky, on the Big South Fork of Nolin Creek, in what was then Hardin and is now La Rue County, three miles from Hodgenville. The ground had nothing attractive about it but its cheapness. It was hardly more grateful than the rocky hillslopes of New England. It required full as earnest and intelligent industry to persuade a living out of those barren hillocks and weedy hollows covered with stunted and scrubby underbrush, as it would amid the rocks and sands of the northern coast.

Thomas Lincoln settled down in this dismal solitude to a deeper poverty than any of his name had ever known; and there, in the midst of the most unpromising circumstances that ever witnessed the advent of a hero into this world, Abraham Lincoln was born on the 12th day of February, 1809.

Four years later, Thomas Lincoln purchased a fine farm of two hundred and thirty-eight acres on Knob Creek, near where it flows into the Rolling Fork, and succeeded in getting a portion of it into cultivation. The title, however, remained in him only a little while, and after his property had passed out of his control he looked about for another place to establish himself.

Of all these years of Abraham Lincoln's early childhood we know almost nothing.* He lived a solitary life in the woods, returning from his lonesome little games to his cheerless home. He never talked of these days to his most intimate friends. Once, when asked what he remembered about the war with Great Britain, he replied: "Nothing but this. I had been fishing one day and caught a little fish which I was taking home. I met a soldier in the road, and having been always told at home that we must be good to the soldiers, I gave him my fish." This is only a faint glimpse, but what it shows is rather pleasant—the generous child and the patriotic household. But there is no question that these first years of his life had their lasting effect upon the temperament of this great mirthful and melancholy man. He had little schooling. He accompanied his sister Sarah† to the only schools that existed in their neighborhood, one kept by Zachariah Riney, and another by

Caleb Hazel, where he learned his alphabet and a little more. But of all those advantages for the cultivation of a young mind and spirit which every home now offers to its children, the books, toys, ingenious games, and daily devotion of parental love, he knew absolutely nothing.

II.

INDIANA.

By the time the boy Abraham had attained his seventh year, the social condition of Kentucky had changed considerably from the early pioneer days. Life had assumed a more settled and orderly course. The old barbarous equality of the earlier time was gone; a difference of classes began to be seen. Those who held slaves assumed a distinct social superiority over those who did not. Thomas Lincoln, concluding that Kentucky was no country for a poor man, determined to seek his fortune in Indiana. He had heard of rich and unoccupied lands in Perry County in that State, and thither he determined to go. He built a rude raft, loaded it with his kit of tools and four hundred gallons of whisky, and trusted his fortunes to the winding water-courses. He met with only one accident on his way; his raft capsized in the Ohio River, but he fished up his kit of tools and most of the ardent spirits, and arrived safely at the place of a settler named Posey, with whom he left his odd invoice of household goods for the wilderness, while he started on foot to look for a home in the dense forest. He selected a spot which pleased him in his first day's journey. He then walked back to Knob Creek and brought his family on to their new home. No humbler cavalcade ever invaded the Indiana timber. Besides his wife and two children, his earthly possessions were of the slightest, for the backs of two borrowed horses sufficed for the load. Insufficient bedding and clothing, a few pans and kettles, were their sole movable wealth. They relied on Lincoln's kit of tools for their furniture, and on his rifle for their food. At Posey's they hired a wagon and literally hewed a path through the wilderness to their new habitation, near Little Pigeon Creek, a mile and a half east of Gentryville, in a rich and fertile forest country.

* There is still living near Knob Creek in Kentucky, at the age of eighty, a man, of whom a portrait is given on page 19, who claims to have known Abraham Lincoln in his childhood—Austin Gollaher. He says he used to play with Abe Lincoln in the shavings of his father's carpenter shop. He tells a story which, if accurate, entitles him to the civic crown which the Romans used to give to one who saved the life of a citizen. When Gollaher was eleven and Lincoln eight the two boys were in the woods in pursuit of

partridges; in trying to "coon" across Knob Creek on a log, Lincoln fell in, and Gollaher fished him out with a sycamore branch—a service to the Republic, the value of which it fatigues the imagination to compute.

† This daughter of Thomas Lincoln is sometimes called Nancy and sometimes Sarah. She seems to have borne the former name during her mother's lifetime, and to have taken her stepmother's name after Mr. Lincoln's second marriage.

Drawn by Henry Farny.

THE KILLING OF ABRAHAM LINCOLN, THE PIONEER, 1786.

Engraved by J. H. E. Whitney.

Thomas Lincoln, with the assistance of his wife and children, built a temporary shelter of the sort called in the frontier language "a half-faced camp"; merely a shed of poles, which defended the inmates on three sides from the foul weather, but left them open to its inclemency in front. For a whole year his family lived in this wretched fold, while he was clearing a little patch of ground for planting corn and building a rough cabin for a permanent residence. They moved into the latter before it was half completed; for by this time the Sparrows had followed the Lincolns from Kentucky, and the half-faced camp was given up to them. But the rude

material for breeches or shoes. His cabin was like that of other pioneers. A few three-legged stools; a bedstead made of poles stuck between the logs in the angle of the cabin, the outside corner supported by a crotched stick driven into the ground; the table, a huge hewed log standing on four legs; a pot, kettle, and skillet, and a few tin and pewter dishes, were all the furniture. The boy Abraham climbed at night to his bed of leaves in the loft, by a ladder of wooden pins driven into the logs.

This life has been vaunted by poets and romancers as a happy and healthful one. Even Dennis Hanks, speaking of his youthful days

HOUSE NEAR BEECHLAND, KENTUCKY, IN WHICH THOMAS LINCOLN AND NANCY HANKS WERE MARRIED, JUNE 12TH, 1806.
(NOW OCCUPIED BY H. F. REED.)

cabin seemed so spacious and comfortable after the squalor of "the camp," that Thomas Lincoln did no further work on it for a long time. He left it for a year or two without doors, or windows, or floor. The battle for existence allowed him no time for superfluities like these. He raised enough corn to support life; the dense forest around him abounded in every form of feathered game; a little way from his cabin an open glade was full of deer-licks, and an hour or two of idle waiting was generally rewarded by a shot at a fine deer, which would furnish meat for a week, and

when his only home was the half-faced camp, says, "I tell you, Billy, I enjoyed myself better then than I ever have since." But we may distrust the reminiscences of old settlers, who see their youth through a rosy mist of memory. The life was neither enjoyable nor wholesome. The rank woods were full of malaria, and singular epidemics from time to time ravaged the settlements. In the autumn of 1818 the little community of Pigeon Creek was almost exterminated by a frightful pestilence called the milk-sickness, or in the dialect of the country "the milk-sick." It is a mys-

terious disease which has been the theme of endless wrangling among Western physicians, and the difficulty of ascertaining anything about it has been greatly increased by the local sensitiveness which forbids any one to admit that any well-defined case has ever been seen in his neighborhood, "although just over the creek, or in the next county, they have had it bad." It seems to have been a malignant form of fever — attributed variously to malaria and to the eating of poisonous herbs by the cattle — attacking cattle as well as human beings, attended with violent retching and a burning sensation in the stomach, often terminating fatally on the third day. In many cases those who apparently recovered lingered for years with health seriously impaired. Among the pioneers of Pigeon Creek, so ill-fed, ill-housed, and uncared for, there was little prospect of recovery from such a grave disorder. The Sparrows, husband and wife, died early in October, and Nancy Hanks Lincoln followed them after an interval of a few days. Thomas Lincoln made the coffins for his dead "out of green lumber cut with a whip-saw," and they were all buried, with scant ceremony, in a little clearing of the forest. It is related of little Abraham, that he sorrowed most of all that his mother should have been laid away with such maimed rites, and that he contrived several months later to have a wandering preacher named David Elkin brought to the settlement, to deliver a

funeral sermon over her grave, already stiff and white with the early winter snows.*

This was the dreariest winter of his life, for before the next December came his father had brought from Kentucky a new wife, who was to change the lot of all the desolate little family very much for the better. Sarah Bush had been an acquaintance of Thomas Lincoln before his first marriage; she had, it is said, rejected him to marry one Johnston, the jailer at Elizabethtown, who had died, leaving her with three children, a boy and two girls. When Lincoln's widowhood had lasted a year, he went down to Elizabethtown to begin again the wooing broken off so many years before. He wasted no time in preliminaries, but promptly made his wishes known, and the next morning they were married. It was growing late in the autumn, and the pioneer probably dreaded another lonely winter on Pigeon Creek. Mrs. Johnston was not altogether portionless. She had a store of household goods which filled a four-horse wagon, borrowed of Ralph Krume, Thomas Lincoln's brother-in-law, to transport the bride to In-

* A stone has been placed over the site of the grave by Mr. P. E. Studebaker of South Bend, Indiana. The stone bears the following inscription: "Nancy Hanks Lincoln, mother of President Lincoln, died October 5th, A. D. 1818, aged 35 years. Erected by a friend of her martyred son, 1879."

diana. It took little time for this energetic and honest Christian woman to make her influence felt, even in these discouraging surroundings, and Thomas Lincoln and the children were the better for her coming all the rest of their lives. The lack of doors and floors was at once corrected. Her honest pride inspired her husband to greater thrift and industry. The goods she brought with her compelled some effort at harmony in the other fittings of the house. She dressed the children in warmer clothing and put them to sleep in comfortable beds. With this little addition to their resources the family were much improved in appearance, behavior, and self-respect.

Thomas Lincoln joined the Baptist church at Little Pigeon

Lincoln, in one of those rare bits of autobiography which he left behind him, "with many bears and other wild animals still in the woods. There were some schools so called, but no qualification was ever required of a teacher beyond 'readin', writin', and cypherin' to the Rule of

in 1823; his oldest child, Sarah, followed his example three years later. They were known as active and consistent members of that communion. Lincoln was himself a good carpenter when he chose to work at his trade; a walnut table made by him is still preserved as part of the furniture of the church to which he belonged.*

Such a woman as Sarah Bush could not be careless of so important a matter as the education of her children, and they made the best use of the scanty opportunities the neighborhood afforded. "It was a wild region," writes Mr.

Three.' If a straggler supposed to understand Latin happened to sojourn in the neighborhood, he was looked upon as a wizard. There was absolutely nothing to excite ambition for education." But in the case of this ungainly boy there was no necessity of any external incentive. A thirst for knowledge as a means of rising in the world was innate in him. It had

HOUSE WHERE PRESIDENT LINCOLN WAS BORN. (FROM A SKETCH FROM MEMORY, IN POSSESSION OF R. T. DURRETT, ESQ.)

nothing to do with that love of science for its own sake which has been so often seen in lowly savants, who have sacrificed their lives to the pure desire of knowing the works of God. All the little learning he ever acquired he seized as a tool to better his condition. He learned his letters that he might read books and see how men in the great world outside of his woods had borne themselves in

logs, as distinguished from the more aristocratic "split logs," with earthen floors, and small holes for windows, sometimes illuminated by as much light as could penetrate through panes of paper greased with lard. The teachers were usually in keeping with their primitive surroundings. The profession offered no rewards sufficient to attract men of education or capacity. After a few months of

VIEW OF ROCK SPRING ON THE THOMAS LINCOLN FARM NEAR THE HOUSE WHERE THE PRESIDENT WAS BORN.

the fight for which he longed. He learned to write, first, that he might have an accomplishment his playmates had not; then that he might help his elders by writing their letters, and enjoy the feeling of usefulness which this gave him; and finally that he might copy what struck him in his reading and thus make it his own for future use. He learned to cipher certainly from no love of mathematics, but because it might come in play in some more congenial business than the farm-work which bounded the horizon of his contemporaries. Had it not been for that interior spur which kept his clear spirit at its task, his schools could have done little for him; for, counting his attendance under Riney and Hazel in Kentucky, and under Dorsey, Crawford, and Swaney in Indiana, it amounted to less than a year in all. The schools were much alike. They were held in deserted cabins of round

desultory instruction young Abraham knew all that these vagrant literati could teach him. His last school-days were passed with one Swaney in 1826, who taught at a distance of four and a half miles from the Lincoln cabin. The nine miles of walking doubtless seemed to Thomas Lincoln a waste of time, and the lad was put at steady work and saw no more of school.

But it is questionable whether he lost anything by being deprived of the ministrations of the backwoods dominies. When his tasks ended, his studies became the chief pleasure of his life. In all the intervals of his work—in which he never took delight, knowing well enough that he was born for something better than that—he read, wrote, and ciphered incessantly. His reading was naturally limited by his opportunities, for books were among the rarest of luxuries in that region and time. But he read everything he could lay his hands

upon, and he was certainly fortunate in the few books of which he became the possessor. It would hardly be possible to select a better handful of classics for a youth in his circumstances than the few volumes he turned with a nightly and daily hand — the Bible, Æsop's Fables, Robinson Crusoe, The Pilgrim's Progress, a History of the United States, and Weems's Life of Washington. These were the best, and these he read over and over till he knew them almost by heart. But his voracity for anything printed was insatiable. He would sit in the twilight and read a dictionary

to think of this great-spirited child, battling year after year against his evil star, wasting his ingenuity upon devices and makeshifts, his high intelligence starving for want of the simple appliances of education which are now offered gratis to the poorest and most indifferent. He did a man's work from the time he left school; his strength and stature were already far beyond those of ordinary men. He wrought his appointed tasks ungrudgingly, though without enthusiasm; but when his employer's day was over, his own began.

John Hanks says: "When Abe and I re-

HODGEN'S MILL AND DAM ON MAIN NOLIN CREEK, THREE MILES FROM LINCOLN'S BIRTHPLACE; TOWN OF HODGENSVILLE IN THE BACKGROUND.

as long as he could see. He used to go to David Turnham's, the town constable, and devour the Revised Statutes of Indiana, as boys in our day do the Three Guardsmen. Of the books he did not own he took voluminous notes, filling his copy-book with choice extracts, and poring over them until they were fixed in his memory. He could not afford to waste paper upon his own original compositions. He would sit by the fire at night and cover the wooden shovel with essays and arithmetical exercises, which he would shave off and begin again. It is touching

turned to the house from work he would go to the cupboard, snatch a piece of corn-bread, take down a book, sit down, cock his legs up as high as his head, and read."* The picture may be lacking in grace, but its truthfulness is beyond question. The habit remained with him always. Some of his greatest work in later years was done in this grotesque Western fashion,—“sitting on his shoulder-blades.”

Otherwise his life at this time differed little from that of ordinary farm-hands. His great strength and intelligence made him a valu-

fact that this act of common humanity was regarded as something remarkable in the neighborhood; the grateful sot himself always said "it was mighty clever of Abe to tote me so far that cold night." It was also considered an eccentricity that he hated and preached against cruelty to animals. Some of his comrades remember still his bursts of righteous wrath, when a boy, against the wanton murder of turtles and other creatures. He was evidently of better and finer clay than his fellows, even in those wild and igno-

legacy of the dying Sparrow family, and John Hanks (son of the carpenter Joseph with whom Thomas Lincoln learned his trade), who came from Kentucky several years after the others. It was probably as much the inexhaustible good nature and kindly helpfulness of young Abraham which kept the peace among all these heterogeneous elements, effervescing with youth and confined in a one-roomed cabin, as it was the Christian sweetness and firmness of the

woman of the house. It was a happy and united household: brothers and sisters and cousins living peacefully under the gentle rule of the good stepmother, but all acknowledging from a very early period the supremacy in goodness and cleverness of their big brother Abraham. Mrs. Lincoln, not long before her death, gave striking testimony of his winning and loyal character. She said to Mr. Herndon:*

* Lamon, p. 39.

say, what scarcely one mother in a thousand can say, Abe never gave me a cross word or look, and never refused in fact or appearance to do anything I asked him. His mind and mine—what little I had—seemed to run together.

. . . I had a son John, who was raised with Abe. Both were good boys, but I must say, both now being dead, that Abe was the best boy I ever saw or expect to see." Such were the beginnings of this remarkable career, sacred, as we see, from childhood to duty and to human kindliness.

We are making no claim of early saintship for him. He was merely a good boy, with sufficient wickedness to prove his humanity. One of his employers, undazzled by recent history, faithfully remembers that young Abe liked his dinner and his pay better than his work: there is surely nothing alien to ordinary mortality in this. It is also reported that he sometimes impeded the celerity of harvest operations by making burlesque speeches, or worse than that, comic sermons, from the top of some tempting stump, to the delight of the hired hands and the exasperation of the farmer. His budding talents as a writer were not always used discreetly. He was too much given to scribbling coarse satires and chronicles, in prose, and in something which had to him and his friends the air of verse. From this arose occasional heart-burnings and feuds, in which Abraham bore his part according to the custom of the country. Despite his Quaker ancestry and his natural love of peace, he was no non-resistant, and when he once entered upon a quarrel the opponent usually had the worst of it. But he was generous and placable, and some of his best friends were those with whom he had had differences, and had settled them in the way then prevalent,—in a ring of serious spectators, calmly and critically chewing their cud under the shade of some spreading oak, at the edge of the timber.

Before we close our sketch of this period of Lincoln's life, it may not be amiss to glance for a moment at the state of society among the people with whom his lot was cast in these important years.

In most respects there had been little moral or material improvement since the early settlement of the country. Their houses were usually of one room, built of round logs with the bark on. We have known a man to gain the sobriquet of "Split-log Mitchell" by indulging in the luxury of building a cabin of square-hewn timbers. Their dress was still mostly of tanned deer-hide, a material to the last degree uncomfortable when the wearer was caught in a shower. Their shoes were of the same, and a good Western authority calls a wet moccasin "a decent way of going

barefoot." About the time, however, when Lincoln grew to manhood, garments of wool and of tow began to be worn, dyed with the juice of the butternut or white walnut, and the hides of neat-cattle began to be tanned. But for a good while it was only the women who indulged in these novelties. There was little public worship. Occasionally an itinerant preacher visited a county, and the settlers for miles around would go nearly in mass to the meeting. If a man was possessed of a wagon, the family rode luxuriously; but as a rule the men walked and the women went on horseback with the little children in their arms. It was considered no violation of the sanctities of the occasion to carry a rifle and take advantage of any game which might be stirring during the long walk. Arriving at the place of meeting, which was some log cabin if the weather was foul, or the shade of a tree if it was fair, the assembled worshipers threw their provisions into a common store and picnicked in neighborly companionship. The preacher would then take off his coat, and go at his work with an energy unknown to our days.

There were few other social meetings. Men came together for "raisings," where a house was built in a day; for "log-rollings," where tons of excellent timber were piled together and wastefully burned; for wolf-hunts, where a tall pole was erected in the midst of a prairie or clearing, and a great circle of hunters formed around it, sometimes of miles in diameter, which, gradually contracting with shouts and yells, drove all the game in the woods together at the pole for slaughter; and for horse-races, which bore little resemblance to those magnificent exhibitions which are the boast of Kentucky at this time. In these affairs the women naturally took no part; but weddings, which were entertainments scarcely less rude and boisterous, were their own peculiar province. These festivities lasted rarely less than twenty-four hours. The guests assembled in the morning. There was a race for the whisky bottle; a midday dinner; an afternoon of rough games and outrageous practical jokes; a supper and dance at night, interrupted by the successive withdrawals of the bride and groom, attended with ceremonies and jests of more than Rabelaisian crudeness; and a noisy dispersal next day.

The one point at which they instinctively clung to civilization was their regard for law and reverence for courts of justice. Yet these were of the simplest character and totally devoid of any adventitious accessories. An early jurist of the country writes:* "I was Circuit Prosecuting Attorney at the time of the trials at the falls of Fall Creek, where

* O. H. Smith, "Early Indiana Trials," p. 285.

Pendleton now stands. Four of the prisoners were convicted of murder, and three of them hung for killing Indians. The court was held in a double log cabin, the grand jury sat upon a log in the woods, and the foreman signed the bills of indictment, which I had prepared, upon his knee; there was not a petit juror that had shoes on; all wore moccasins, and were belted around the waist, and carried side-knives used by the hunters." Yet amidst all this apparent savagery we see justice was done, and the law vindicated even against the bitterest prejudices of these pioneer jurymen.

They were full of strange superstitions. The belief in witchcraft had long ago passed away with the smoke of the fagots from old and New England, but it survived far into this century in Kentucky and the lower halves of Indiana and Illinois,—touched with a peculiar tinge of African magic. The pioneers believed in it for good and evil. Their veterinary practice was mostly by charms and incantations; and when a person believed himself bewitched, a shot at the image of the witch with a bullet melted out of a half-dollar was the favorite curative agency. Luck was an active divinity in their apprehension, powerful for blessing or bane, announced by homely signs, to be placated by quaint ceremonies. A dog crossing the hunter's path spoiled his day, unless he instantly hooked his little fingers together, and pulled till the animal disappeared.* They were familiar with the ever-recurring mystification of the witch-hazel, or divining-rod; and the "cure by faith" was as well known to them as it has since become in a more sophisticated state of society. The commonest occurrences were heralds of death and doom. A bird lighting in a window, a dog baying at certain hours, the cough of a horse in the direction of a child, the sight, or worse still, the touch of a dead snake, heralded domestic woe. A wagon driving past the house with a load of baskets was a warning of atmospheric disturbance. A vague and ignorant astronomy governed their plantings and sowings, the breeding of their cattle, and all farm-work. They must fell trees for fence-rails before noon, and in the waxing of the moon. Fences built when there was no moon † would give way; but that was the proper season for planting potatoes and other vegetables whose fruit grows underground; those which bear their product in the air must be planted when the moon shone. The magical power of the moon was wide in its influence; it extended to the most minute details of life.

Among these people, and in all essential respects one of them, Abraham Lincoln passed his childhood and youth. He was not re-

markably precocious. His mind was slow in acquisition, and his powers of reasoning and rhetoric improved constantly to the end of his life, at a rate of progress marvelously regular and sustained. But there was that about him, even at the age of nineteen years, which might well justify his admiring friends in presaging for him an unusual career. He had read every book he could find, and could "spell down" the whole county at their orthographical contests. By dint of constant practice he had acquired an admirably clear and serviceable handwriting. He occasionally astounded his companions by such glimpses of occult science as that the world is round and that the sun is relatively stationary. He wrote, for his own amusement and edification, essays on politics, of which gentlemen of standing who had been favored with a perusal said with authority, at the cross-roads grocery, "The world can't beat it." One or two of these compositions got into print and vastly increased the author's local fame. He was also a magnanimous boy, with a larger and kindlier spirit than common. His generosity, courage, and capability of discerning two sides to a dispute, were remarkable even then, and won him the admiration of those to whom such qualities were unknown. But perhaps after all the thing which gained and fixed his mastery over his fellows was to a great degree his gigantic stature and strength. He attained his full growth, six feet and four inches, two years before he came of age. He rarely met with a man he could not easily handle. His strength is still a tradition in Spencer County.‡ One aged man says that he has seen him "pick up and carry away a chicken-house weighing six hundred pounds." At another time, seeing some men preparing a contrivance for lifting some large posts, Abe quickly shouldered the posts and took them where they were needed. One of his employers says, "He could sink an axe deeper into wood than any man I ever saw." With strength like this and a brain to direct it, a man was a born leader in that country and at that time.

There are, of course, foolish stories extant that Abraham used to boast, and that others used to predict, that he should be President some day. The same thing is daily said of thousands of boys who will never be constables. But there is evidence that he felt too large for the life of a farm-hand on Pigeon Creek, and his thoughts naturally turned, after the manner of restless boys in the West, to the river, as the avenue of escape from the narrow life of the woods. He once asked an old friend to give him a recommendation to some steamboat on the Ohio, but desisted

* Lamon, p. 44.

† Ib.

‡ Lamon, p. 52.

from his purpose on being reminded that his father had the right to dispose of his time for a year or so more. But in 1828 an opportunity offered for a little glimpse of the world outside, and the boy gladly embraced it. He was hired by Mr. Gentry, the proprietor of the neighboring village of Gentryville, to accompany his son with a flat-boat of produce to New Orleans and intermediate landings. The voyage was made successfully, and Abraham gained great credit for his management and sale of the cargo. The only important incident of the trip occurred at the plantation of Madame Duchesne, a few miles below Baton Rouge. The young merchants had tied up for the night and were asleep in the cabin, when they were aroused by shuffling footsteps, which proved to be a gang of marauding negroes, coming to rob the boat. Abraham instantly attacked them with a club, knocked several overboard and put the rest to flight; flushed with battle, he and Allen Gentry carried the war into the enemy's country, and pursued the retreating Africans some distance in the darkness. They then returned to the boat, bleeding but victorious, and hastily swung into the stream and floated down the river till daylight. Lincoln's exertions in later years for the welfare of the African race showed that this night battle had not led him to any hasty and hostile generalizations.

The next autumn, John Hanks, the steadiest and most trustworthy of the family, went to Illinois. Though an illiterate and rather dull man, he had a good deal of solidity of character and consequently some influence and consideration in the household. He settled in Macon County, and was so well pleased with the country, and especially with its admirable distribution into prairie and timber, that he sent repeated messages to his friends in Indiana to come out and join him. Thomas Lincoln was always ready to move. He had probably by this time despaired of ever owning any unencumbered real estate in Indiana, and the younger members of the family had little to bind them to the place where they saw nothing in the future but hard work and poor living. Thomas Lincoln handed over his farm to Mr. Gentry, sold his crop of corn and hogs, packed his household goods and those of his children and sons-in-law into a single wagon, drawn by two yoke of oxen, the combined wealth of himself and Dennis Hanks, and started for the new State. His daughter Sarah or Nancy, for she was called by both names, who married Aaron Grigsby a few years before, had died in childbirth. The emigrating family consisted of the Lincolns, John Johnston, Mrs. Lincoln's son, and

her daughters, Mrs. Hall and Mrs. Hanks, with their husbands.

Two weeks of weary tramping through forest roads and muddy prairie, and the dangerous fording of streams swollen by the February thaws, brought the party to John Hanks's place near Decatur. He met them with a frank and energetic welcome. He had already selected a piece of ground for them a few miles from his own, and had the logs ready for their house. They numbered men enough to build without calling in their neighbors, and immediately put up a cabin on the north fork of the Sangamon River. The family thus housed and sheltered, one more bit of filial work remained for Abraham before assuming his virile independence. With the assistance of John Hanks, he plowed fifteen acres, and split, from the tall walnut-trees of the primeval forest, enough rails to surround them with a fence. Little did either dream, while engaged in this work, that the day would come when the appearance of John Hanks in a public meeting, with two of these rails on his shoulder, would electrify a State convention, and kindle throughout the country a contagious and unreasoning enthusiasm, whose results would reach to endless generations.

III.

ILLINOIS IN 1830.

THE Lincolns arrived in Illinois just in time to entitle themselves to be called pioneers. When, in after years, associations of "Old Settlers" began to be formed in Central Illinois, the qualification for membership agreed upon by common consent was a residence in the country before "the winter of the deep snow." This was in 1830-31, a season of such extraordinary severity that it has formed for half a century a recognized date in the middle counties of Illinois, among those to whom in those days diaries and journals were unknown. The snowfall began in the Christmas holidays and continued until the snow was three feet deep on level ground. Then came a cold rain, freezing as it fell until a thick crust of ice gathered over the snow. The weather became intensely cold, the mercury sinking to twelve degrees below zero, Fahrenheit, and remaining there for two weeks.* The storm came on with such suddenness that all who were abroad had great trouble in reaching their homes, and many perished. One man† relates that he and a friend or two were out in a hunting party with an ox-team. They had

* Rev. J. M. Sturtevant, "Address to Old Settlers of Morgan County."

† Thomas Buckles, of McLean County.

collected a wagon-load of game and were on their way home when the storm struck them. After they had gone four miles they were compelled to abandon their wagon; the snow fell in heavy masses "as if thrown from a scoop-shovel"; arriving within two miles of their habitation, they were forced to trust to the instinct of their animals and reached home hanging to the tails of their steers. Not all were so fortunate. Some were found weeks afterwards in the snow-drifts, their flesh gnawed by famished wolves; and the fate of others was unknown until the late spring sunshine revealed their resting-places. To those who escaped, the winter was tedious and terrible. It is hard for us to understand the isolation to which such weather condemns the pioneer. For weeks they remained in their cabins hoping for some mitigation of the frost. When at last they were driven out by the fear of famine, the labor of establishing communications was enormous. They finally made roads by "wallowing through the snow," as an Illinois historian expresses it,* and going patiently over the same track until the snow was trampled hard and rounded like a turnpike. These roads lasted far into the spring, when the snow had melted from the plains, and wound for miles like threads of silver over the rich black loam of the prairies. After that winter game was never again so plentiful in the State. Much still remained, of course, but it never recovered entirely from the rigors of that season and the stupid enterprise of the pioneer hunters, who, when they came out of their snow-beleaguered cabins, began chasing and killing the starved deer by herds. It was easy work; the crust of the snow was strong enough to bear the weight of men and dogs, but the slender hoofs of the deer would after a few bounds pierce the treacherous surface. This destructive slaughter went on until the game grew too lean to be worth the killing. All sorts of wild animals grew scarce from that winter. Old settlers say that the slow cowardly breed of prairie wolves, which used to be caught and killed as readily as sheep, disappeared about that time and none but the fleet and stronger survived.†

Only once since then has nature shown such extravagant severity in Illinois, and that was on a day in the winter of 1836, known to Illinoisans as "the sudden change." At noon on the 20th of December, after a warm and rainy morning, the ground being covered with mud and slush, the temperature fell instantly forty degrees. A man riding into Springfield for a marriage license says a roaring and crackling wind came upon him and the rain-drops drip-

ping from his bridle-reins and beard changed in a second into jingling icicles. He rode hastily into the town and arrived in a few minutes at his destination; but his clothes were frozen like sheet iron, and man and saddle had to be taken into the house together to be thawed apart. Geese and chickens were caught by the feet and wings and frozen to the wet ground. A drove of a thousand hogs, which were being driven to St. Louis, rushed together for warmth, and became piled in a great heap. Those inside smothered and those outside froze, and the ghastly pyramid remained there on the prairie for weeks: the drovers barely escaped with their lives. Men killed their horses, disemboweled them, and crept into the cavity of their bodies to escape the murderous wind.‡

The pioneer period of Illinois was ending as Thomas Lincoln and his tall boy drove their ox-cart over the Indiana line. The population of the State had grown to 157,447. It still clung to the wooded borders of the water-courses; scattered settlements were to be found all along the Mississippi and its affluents, from where Cairo struggled for life in the swamps of the Ohio to the bustling and busy mining camps which the recent discovery of lead had brought to Galena. A line of villages from Alton to Peoria dotted the woodland which the Illinois River had stretched, like a green baldric, diagonally across the bosom of the State. Then there were long reaches of wilderness before you came to Fort Dearborn, where there was nothing as yet to give promise of that miraculous growth which was soon to make Chicago a proverb to the world. There were a few settlements in the fertile region called the Military Tract; the southern part of the State was getting itself settled here and there. People were coming in freely to the Sangamon country. But a grassy solitude stretched from Galena to Chicago, and the upper half of the State generally was a wilderness. The earlier emigrants, principally of the poorer class of Southern farmers, shunned the prairies with something of a superstitious dread. They preferred to pass the first years of their occupation in the wasteful and laborious work of clearing a patch of timber for corn, rather than enter upon those rich savannas which were ready to break into fertility at the slightest provocation of culture. Even so late as 1835, writes Mr. J. F. Speed, "no one dreamed the prairies would ever be occupied." It was thought they would be

‡ Although all inhabitants of Sangamon County are acquainted with these facts, and we have often heard them and many others like them from the lips of eye-witnesses, we have preferred to cite only those which are given in the careful and conscientious compilation entitled "The Early Settlers of Sangamon County," by the Rev. John Carroll Power.

* Power, "Early Settlers of Sangamon County," p. 62.

† "Old Times in McLean County," p. 414.

used perpetually as grazing-fields for stock. For years the long processions of "movers" wound over those fertile and neglected plains, taking no hint of the wealth suggested by the rank luxuriance of vegetable growth around them, the carpet of brilliant flowers spread over the verdant knolls, the strong, succulent grass that waved in the breeze, full of warm and vital odor, as high as the waist of a man. In after years, when the emigration from the Northern and Eastern States began to pour in, the prairies were rapidly taken up, and the relative growth and importance of the two sections of the State were immediately reversed. Governor Ford, writing about 1847, attributes this result to the fact that the best class of Southern people were slow to emigrate to a State where they could not take their slaves; while the settlers from the North, not being debarred by the State Constitution from bringing their property with them, were of a different class. "The northern part of the State was settled in the first instance by wealthy farmers, enterprising merchants, millers, and manufacturers. They made farms, built mills, churches, school-houses, towns, and cities, and constructed roads and bridges as if by magic; so that although the settlements in the southern part of the State are from twenty to fifty years in advance on the score of age, yet are they ten years behind in point of wealth and all the appliances of a higher civilization."*

At the time which we are specially considering, however, the few inhabitants of the south and the center were principally from what came afterwards to be called the border slave States. They were mostly a simple, neighborly, unambitious people, contented with their condition, living upon plain fare, and knowing not much of anything better. Luxury was, of course, unknown; even wealth, if it existed, could procure few of the comforts of refined life. But there was little or no money in circulation. Exchanges were effected by the most primitive forms of barter, and each family must rely chiefly upon itself for the means of living. The neighbors would lend a hand in building a cabin for a newcomer; after that he must in most cases shift for himself. Many a man coming from an old community, and imperfectly appreciating the necessities of pioneer life, has found suddenly, on the approach of winter, that he must learn to make shoes or go barefoot. The furniture of their houses was made with an axe from the trees of the forest. Their clothing was all made at home. The buckskin days were over to a great extent, though an occasional hunting-shirt and pair of moccasins were still seen. But flax and hemp had

begun to be cultivated, and as the wolves were killed off the sheep-folds increased, and garments resembling those of civilization were spun and woven, and cut and sewed, by the women of the family. When a man had a suit of jeans colored with butternut-juice, and his wife a dress of linsey, they could appear with the best at a wedding or a quilting frolic. The superfluous could not have been said to exist in a community where men made their own buttons, where women dug roots in the woods to make their tea with, where many children never saw a stick of candy until after they were grown. The only sweetmeats known were those a skillful cook could compose from the honey plundered from the hollow oaks where the wild bees had stored it. Yet there was withal a kind of rude plenty; the woods swarmed with game, and after swine began to be raised, there was the bacon and hoe-cake which any south-western farmer will say is good enough for a king. The greatest privation was the lack of steel implements. His axe was as precious to the pioneer as his sword to the knight errant. Governor Reynolds speaks of the panic felt in his father's family when the axe was dropped into a stream. A battered piece of tin was carefully saved and smoothed, and made into a grater for green corn.

They had their own amusements, of course; no form of society is without them, from the anthropoid apes to the Jockey Club. As to the grosser and ruder shapes taken by the diversions of the pioneers, we will let Mr. Herndon speak—their contemporary annalist and ardent panegyrist: "These men could shave a horse's mane and tail, paint, disfigure, and offer it for sale to the owner. They could hoop up in a hogshead a drunken man, they themselves being drunk, put in and nail fast the head, and roll the man down hill a hundred feet or more. They could run down a lean and hungry wild pig, catch it, heat a ten-plate stove-furnace hot, and putting in the pig, could cook it, they dancing the while a merry jig." Wild oats of this kind seem hardly compatible with a harvest of civilization, but it is contended that such of these roysterers as survived their stormy beginnings became decent and serious citizens. Indeed, Mr. Herndon insists that even in their hot youth they showed the promise of goodness and piety. "They attended church, heard the sermon, wept and prayed, shouted, got up and fought an hour, and then went back to prayer, just as the spirit moved them."† The camp-meeting may be said, with no irreverent intention, to have been their principal means of intellectual

* "History of Illinois," p. 280.

† William H. Herndon's speech at Old Settlers' Meeting, Menard County.

excitement. The circuit preachers were for a long time the only circulating medium of thought and emotion that kept the isolated settlements from utter spiritual stagnation. They were men of great physical and moral endurance, absolutely devoted to their work, which they pursued in the face of every hardship and discouragement. Their circuits were frequently so great in extent that they were forced to be constantly on the route; what reading they did was done in the saddle. They received perhaps fifty dollars from the missionary fund and half as much more from their congregations, paid for the most part in necessities of life.* Their oratory was suited to their longitude, and was addressed exclusively to the emotions of their hearers. It was often very effective, producing shouts and groans and genuflections among the audience at large, and terrible convulsions among the more nervous and excitable. We hear sometimes of a whole congregation prostrated as by a hurricane, flinging their limbs about in furious contortions, with wild outcries. To this day some of the survivors of that period insist that it was the spirit of the Almighty, and nothing less, that thus manifested itself. The minister, however, did not always share in the delirium of his hearers. Governor Reynolds tells us of a preacher in Sangamon County, who, before his sermon, had set a wolf-trap in view of his pulpit. In the midst of his exhortations his keen eyes saw the distant trap collapse, and he continued in the same intonation with which he had been preaching, "Mind the text, brethren, till I go kill that wolf!" With all the failings and eccentricities of this singular class of men, they did a great deal of good, and are entitled to especial credit among those who conquered the wilderness. The emotions they excited did not all die away in the shouts and contortions of the meeting. Not a few of the cabins in the clearings were the abode of a fervent religion and an austere morality. Many a traveler, approaching a rude hut in the woods in the gathering twilight, distrusting the gaunt and silent family who gave him an unsmiling welcome, the bare interior, the rifles and knives conspicuously displayed, has felt his fears vanish when he sat down to supper, and the master of the house, in a few fervent words, invoked the blessing of heaven on the meal.

There was very little social intercourse; a visit was a serious matter, involving the expenditure of days of travel. It was the custom among families, when the longing for the sight of kindred faces was too strong to withstand, to move in a body to the distant settlement

where their relatives lived and remain with them for a month at a time. The claims of consanguinity were more regarded than now. Almost the only festivities were those which accompanied weddings, and these were, of course, of a primitive kind. The perils and adventures through which the young pioneers went to obtain their brides furnish forth thousands of tales by Western firesides. Instead of taking the rosy daughter of a neighbor, the enterprising bachelor would often go back to Kentucky, and pass through as many adventures in bringing his wife home as a returning crusader would meet between Beirut and Vienna. If she was a young woman who respected herself, the household gear she would insist on bringing would entail an Iliad of embarrassments. An old farmer of Sangamon County still talks of a feather-bed weighing fifty-four pounds with which his wife made him swim six rivers under penalty of desertion.

It was not always easy to find a competent authority to perform the ceremony. A justice in McLean County lived by the bank of a river, and his services were sometimes required by impatient lovers on the other bank when the waters were too torrential to cross. In such cases, being a conscientious man, he always insisted that they should ride into the stream far enough for him to discern their features, holding torches to their faces by night and by storm. The wooing of those days was prompt and practical. There was no time for the gradual approaches of an idler and more conventional age. It is related of one Stout, one of the legendary Nimrods of Illinois, who was well and frequently married, that he had one unfailing formula of courtship. He always promised the ladies whose hearts he was besieging that "they should live in the timber where they could pick up their own firewood."

Theft was almost unknown; property, being so hard to get, was jealously guarded, as we have already noticed in speaking of the settlement of Kentucky. The pioneers of Illinois brought with them the same rigid notions of honesty which their environment maintained. A man in Macoupin County left his wagon, loaded with corn, stuck in the prairie mud for two weeks near a frequented road. When he returned he found some of his corn gone, but there was money enough tied in the sacks to pay for what was taken. Men carrying bags of silver from the towns of Illinois to St. Louis rather made a display of it, as it enhanced their own importance, and there was no fear of robbery. There were of course no locks on the cabin doors, and the early merchants sometimes left their stores unprotected for days together when they went to the nearest city to replenish their

* "Old Times in McLean County," p. 194.

stocks. Of course there were rare exceptions to this rule, but a single theft alarmed and excited a whole neighborhood. When a crime was traced home, the family of the criminal were generally obliged to remove.

There were still, even so late as the time to which we are referring, two alien elements in the population of the State — the French and the Indians. The French settlements about Kaskaskia retained much of their national character, and the pioneers from the South who visited them or settled among them never ceased to wonder at their gayety, their peaceable industry and enterprise, and their domestic affection, which they did not care to dissemble and conceal like their shy and reticent neighbors. It was a daily spectacle, which never lost its strangeness for the Tennesseans and Kentuckians, to see the Frenchman returning from his work greeted by his wife and children with embraces of welcome "at the gate of his door-yard, and in view of all the villagers."* The natural and kindly fraternization of the Frenchmen with the Indians was also a cause of wonder to the Americans. The friendly intercourse between them, and their occasional intermarriages, seemed little short of monstrous to the ferocious exclusiveness of the Anglo-Saxon.† The Indians in the central part of Illinois cut very little figure in the reminiscences of the pioneers; they occupied much the same relation to them as the tramp to the housewife of to-day. The Winnebago war in 1827 and the Black Hawk war in 1831 disturbed only the northern portions of the State. A few scattered and vagrant lodges of Pottawatomies and Kickapoos were all the pioneers of Sangamon and neighboring counties ever met. They were spared the heroic struggle of the advance-guard of civilization in other States. A woman was sometimes alarmed by a visit from a drunken savage; poultry and pigs occasionally disappeared when they were in the neighborhood; but life was not darkened by the constant menace of massacre. A few years earlier, indeed, the relations of the two races had been more strained, as may be inferred from an act passed by the territorial Legislature in 1814, offering a reward of fifty dollars to any citizen or ranger who should kill or take any depredating Indian.‡ As only two dollars was paid for killing a wolf, it is easy to see how the pioneers regarded the forest folk in point of relative noxiousness. But ten

years later a handful only of the Kickapoos remained in Sangamon County, the specter of the vanished people. A chief named Machina came one day to a family who were clearing a piece of timber, and issued an order of eviction in these words: "Too much come white man. T'other side Sangamon." He threw a handful of dried leaves in the air to show how he would scatter the pale faces, but he never fulfilled his threats further than to come in occasionally and ask for a drink of whisky. That such trivial details are still related, only shows how barren of incident was the life of these obscure founders of a great empire. Any subject of conversation, any cause of sensation, was a godsend. When Vannoy murdered his wife in Springfield, whole families put on their best clothes and drove fifty miles through bottomless mud and swollen rivers to see him hanged.

It is curious to see how naturally in such a state of things the fabric of political society developed itself from its germ. The county of Sangamon was called by an act of the Legislature in 1821 out of a verdant solitude of half a million acres, inhabited by a few families. An election for county commissioners was ordered; three men were chosen; they came together at the cabin of John Kelly, at Spring Creek. He was a roving bachelor from North Carolina, devoted to the chase, who had built his hut three years before on the margin of this green-bordered rivulet, where the deer passed by in hundreds, going in the morning from the shady banks of the Sangamon to feed on the rich green grass of the prairie, and returning in the twilight. He was so delighted with this hunters' paradise§ that he sent for his brothers to join him. They came and brought their friends, and so it came about that in this immense county of over eight hundred square miles in extent the settlement of John Kelly at Spring Creek was the only place where there was shelter for the commissioners; and thus it became the temporary county-seat, duly described in the official report of the commissioners as "a certain point in the prairie near John Kelly's field, on the waters of Spring Creek, at a stake marked Z and D (the initials of the commissioners) to be the temporary seat of justice for said county; and we do further agree that the said county-seat be called and known by the name of Springfield"; and in this manner the future capital received that hackneyed title, when the distinctive and musical name of Sangamon was ready to their hands. The same day they agreed with John Kelly to build them a court-house, for which they paid him

forty-two dollars and fifty cents. In twenty-four days the house was built—one room of rough logs, the jury retiring to any sequestered glade they fancied for their deliberation. They next ordered the building of a jail, which cost just twice as much money as the court-house, for obvious reasons. Constables and overseers of the poor were appointed, and all the machinery of government prepared for the population which was hourly expected. It was taken for granted that malefactors would come and the constables have employment, and the poor they would have always with them, when once they began to arrive. This was only a temporary arrangement, but when, a year or two later, the time came to fix upon a permanent seat of justice for the county, the resources of the Spring Creek men were equal to the emergency. When the commissioners came to decide on the relative merits of Springfield and another site a few miles away, they led them through brake, through brier, by mud knee-deep and by water-courses so exasperating that the wearied and baffled officials declared they would seek no further, and Springfield became the county seat for all time; and greater destinies were in store for it through means not wholly dissimilar. Nature had made it merely a pleasant hunting-ground; the craft and the industry of its first settlers made it a capital.

The courts which were held in these log huts were as rude as might be expected; yet there is evidence that although there was no superfluity of law or of learning, justice was substantially administered. The lawyers came mostly from Kentucky, though an occasional New Englander confronted and lived down the general prejudice against his region and obtained preferment. The profits of the profession were inconceivably small. One early State's Attorney* describes his first circuit as a tour of shifts and privations not unlike the wanderings of a mendicant friar. In his first county he received a fee of five dollars for prosecuting the parties to a sanguinary affray. In the next he was equally successful, but barely escaped drowning in Spoon River. In the third there were but two families at the county-seat, and no cases on the docket. Thence he journeyed across a trackless prairie sixty miles, and at Quincy had one case and gained five dollars. In Pike County our much-enduring jurist took no cash, but found a generous sheriff who entertained him without charge. "He was one of nature's noblemen, from Massachusetts," writes the grateful prosecutor. The lawyers in what was called good practice earned less than a street-sweeper to-day. It is related that the famous S. A. Douglas once traveled from

* "History of Sangamon County," p. 83.

Springfield to Bloomington and made an extravagant speech, and having gained his case received a fee of five dollars.† In such a state of things it was not to be wondered at that the technicalities of law were held in somewhat less veneration than what the pioneer regarded as the essential claims of justice. The infirmities of the jury system gave them less annoyance than it gives us. Governor Ford mentions a case where a gang of horse-thieves succeeded in placing one of their confederates upon a jury which was to try them; but he was soon brought to reason by his eleven colleagues making preparations to hang him to the rafters of the jury room. The judges were less hampered by the limitations of their legal lore than by their fears of a loss of popularity as a result of too definite charges in civil suits, or too great severity in criminal cases. They grew very dexterous in avoiding any commitment as to the legal or moral bearings of the questions brought before them. They generally refused to sum up, or to comment upon evidence; when asked by the counsel to give instructions they would say, "Why, gentlemen, the jury understand this case as well as you or I. They will do justice between the parties."‡ One famous judge, who was afterwards governor, when sentencing a murderer, impressed it upon his mind, and wished him to inform his friends, that it was the jury and not the judge who had found him guilty, and then asked him on what day he would like to be hanged. It is needless to say that the bench and bar were not all of this class. There were even at that early day lawyers, and not a few, who had already won reputation in the older States, and whose names are still honored in the profession. Cook, McLean, Edwards, Kane, Thomas, Reynolds, and others, the earliest lawyers of the State, have hardly been since surpassed for learning and ability.

In a community where the principal men were lawyers, where there was as yet little commerce, and industrial enterprise was unknown, it was natural that one of the chief interests of life should be the pursuit of politics. The young State swarmed with politicians; they could be found chewing and whittling at every cross-roads inn; they were busy at every horse-race, arranging their plans and extending their acquaintance; around the burgoo-pot of the hunting party they discussed measures and candidates; they even invaded the camp-meeting and did not disdain the pulpit as a tribune. Of course there was no such thing as organization in the pioneer

† "The Good Old Times in McLean County," p. 255.

‡ Ford's "History of Illinois," p. 83.

days. Men were voted for, to a great extent, independently of partisan questions affecting the nation at large, and in this way the higher offices of the State were filled for many years by men whose personal character compelled the respect and esteem of the citizens. The year 1826 is generally taken as the date which witnessed the change from personal to partisan politics, though several years more elapsed before the rule of conventions came in, which put an end to individual candidacy. In that year Mr. Cook, who had long represented the State in Congress with singular ability and purity, was defeated by Governor Duncan, the candidate of the Jackson men, on account of the vote given by Cook which elected John Quincy Adams to the Presidency. The bitter intolerance of the Jackson party naturally caused their opponents to organize against them, and there were two parties in the State from that time forward. The change in political methods was inevitable, and it is idle to deplore it; but the former system gave the better men in the new State a power and prominence which they have never since enjoyed. Such men as Governor Edwards, who came with the prestige of a distinguished family connection, a large fortune, a good education, and a distinction of manners and of dress,—ruffles, gold buttons, and fair-topped boots,—which would hardly have been pardoned a few years later; and Governor Coles, who had been private secretary to Madison, and was familiar with the courts of Europe, a man as notable for his gentleness of manners as for his nobility of nature, could never have come so readily and easily to the head of the government after the machine of the caucus had been perfected. Real ability then imposed itself with more authority upon the ignorant and unpretending politicians from the back timber; so that it is remarked by those who study the early statutes of Illinois that they are far better drawn up, better edited, than those of a later period,* when illiterate intriguants, conscious of the party strength behind them, insisted on shaping legislation according to their own fancy. The men of cultivation wielded an influence in the Legislature entirely out of proportion to their numbers, as the ruder sort of pioneers were naturally in a large majority. The type of a not uncommon class in Illinois tradition was a member from the South who could neither read nor write, and whose apparently ironical patronymic was Grammar. When first elected he had never worn anything but leather; but regarding his tattered buckskin as unfit for the garb of a lawgiver, he and his sons gathered hazelnuts enough to barter at the nearest store for

a few yards of blue strouding such as the Indians used for breech-clouts. When he came home with his purchase and had called together the women of the settlement to make his clothes, it was found that there was only material enough for a very short coat and a long pair of leggins, and thus attired he went to Kaskaskia, the territorial capital. Uncouth as was his appearance, he had in him the raw material of a politician. He invented a system—which was afterwards adopted by many whose breeches were more fashionably cut—of voting against every measure which was proposed. If it failed, the responsibility was broadly shared; if it passed and was popular, no one would care who voted against it; if it passed and did not meet the favor of the people, John Grammar could vaunt his foresight. Between the men like Coles and the men like Grammar there was a wide interval, and the average was about what the people of the State deserved and could appreciate. A legislator was as likely to suffer for doing right as for doing wrong. Governor Ford, in his admirable sketch of the early history of the State, mentions two acts of the Legislature, both of them proper and beneficial, as unequaled in their destructive influence upon the great folks of the State. One was a bill for a loan to meet the honest obligations of the commonwealth, commonly called “the Wiggins loan”; and the other was a law to prevent bulls of inferior size and breed from running at large. This latter set loose all the winds of popular fury: it was cruel, it was aristocratic; it was in the interest of rich men and pampered foreign bulls; and it ended the career of many an aspiring politician in a blast of democratic indignation and scorn. The politician who relied upon immediate and constant contact with the people certainly earned all the emoluments of office he received. His successes were hardly purchased by laborious affability. “A friend of mine,” says Ford, “once informed me that he intended to be a candidate for the Legislature, but would not declare himself until just before the election, and assigned as a reason that it was so very hard to be clever for a long time at once.” Before the caucus had eliminated the individual initiative, there was much more of personal feeling in elections. A vote against a man had something of offense in it, and sometimes stirred up a defeated candidate to heroic vengeance. In 1827 the Legislature elected a State treasurer after an exciting contest, and before the members had left the house the unsuccessful aspirant came in and soundly thrashed, one after the other, four of the representatives who had voted against him.† Such energy was sure

* Ford's “History of Illinois,” p. 31.

† Ford, p. 81.

to meet its reward, and he was soon after made clerk of the Circuit Court. It is related by old citizens of Menard County, as a circumstance greatly to the credit of Abraham Lincoln, that when he was a candidate for the Legislature a man who wanted his vote for another place walked to the polls with him and ostentatiously voted for him, hoping to receive his vote in return. Lincoln voted against him, and the act was much admired by those who saw it.

One noticeable fact is observed in relation to the politicians of the day — their careers were generally brief. Superannuation came early. In the latter part of the last century and the first half of this, men were called old whom we should regard as in the prime of life. When the friends of Washington were first pressing the Presidency upon him in 1788, he urged his "advanced age" as an imperative reason for declining it: he was fifty-six years old. When Ninian Edwards was a candidate for Governor of Illinois in 1826, he was only fifty-one, and yet he considered it necessary in his published addresses to refer to the charge that he was too old for the place, and, while admitting the fact that he was no longer young, to urge in extenuation that there are some old things,—like old whisky, old bacon, and old friends,—which are not without their merits. Even so late as 1848, we find a remarkable letter from Mr. Lincoln, who was then in Congress, bearing upon the same point. His partner, William H. Herndon, had written him a letter, complaining that the old men in Sangamon County were unwilling to let the young ones have any opportunity to distinguish themselves. To this Lincoln answers in his usual tone of grave kindness:

"The subject of your letter is exceedingly painful to me; and I cannot but think there is some mistake in your impression of the motives of the old men. I suppose I am now one of the old men, and I declare on my veracity, which I think is good with you, that nothing could afford me more satisfaction than to learn that you and others of my young friends at home were doing battle in the contest and endearing themselves to the people and taking a stand far above any I have ever been able to reach in their admiration. I cannot conceive that other old men feel differently. Of course I cannot demonstrate what I say; but I was young once, and I am sure I was never ungenerously thrust back."

The man who thus counsels petulant youth with the experienced calmness of age was thirty-nine years old. A state of society where one could at that age call himself or be called by others an old man, is proved by that fact alone to be one of wearing hardships and early decay of the vital powers. The survivors of the pioneers stoutly insist upon the contrary view. "It was a glorious life," says one

old patriarch; "men would fight for the love of it, and then shake hands and be friends; there is nothing like it now." Another says, "I never enjoy my breakfast now as I used to, when I got up and ran down a deer before I could have anything to eat." But they see the past through a rosy mist of memory, transfigured by the eternal magic of youth. The sober fact is that the life was a hard one, with few rational pleasures, few wholesome appliances. The strong ones lived, and some even attained great length of years; but to many age came early and was full of infirmity and pain. If we could go back to what our forefathers endured in clearing the Western wilderness, we could then better appreciate our obligations to them. It is detracting from the honor which is their due to say that their lives had much of happiness or comfort, or were in any respect preferable to our own.

IV.

NEW SALEM.

DURING the latter part of "the winter of the deep snow," Abraham became acquainted with one Denton Offutt, an adventurous and discursive sort of merchant, with more irons in the fire than he could well manage. He wanted to take a flat-boat and cargo to New Orleans, and having heard that Hanks and Lincoln had some experience of the river, he insisted on their joining him. John Johnston was afterwards added to the party, probably at the request of his foster-brother, to share in the golden profits of the enterprise; for fifty cents a day, and a contingent dividend of twenty dollars apiece, seemed like a promise of immediate opulence to the boys. In the spring, when the rivers broke up and the melting snows began to pour in torrents down every ravine and gully, the three young men paddled down the Sangamon in a canoe to the point where Jamestown now stands; whence they walked five miles to Springfield, where Offutt had given them rendezvous. They met him at Elliott's tavern and far from happy. Amid the multiplicity of his engagements he had failed to procure a flat-boat, and the first work his new hands must do was to build one. They cut the timber, with frontier innocence, from "Congress land,"* and soon had a serviceable craft afloat, with which they descended the current of the Sangamon to New Salem, a little village which seems to have been born for the occasion, as it came into existence just before the arrival of Lincoln, flourished for seven years while he remained one of its citizens, and died soon after

* Lamon, p. 79.

MODEL OF LINCOLN'S INVENTION IN THE PATENT OFFICE, WASHINGTON.

REDUCED FAC-SIMILES OF DRAWINGS IN PATENT OFFICE.

he went away. His introduction to his fellow-citizens was effected in a peculiar and somewhat striking manner. Offutt's boat had come to serious embarrassment on Rutledge's mill-dam, and the unwonted incident brought the entire population to the water's edge. They spent a good part of the day watching the hapless flat-boat, resting midships on the dam, the forward end in the air and the stern taking in the turbid Sangamon water. Nobody knew what to do with the disaster except "the low-oar," who is described as a gigantic youth "with his trousers rolled up some five feet," who was wading about the boat and rigging up some undescribed contrivance by which the cargo was unloaded, the boat tilted and the water let out by boring a hole through the bottom, and everything brought safely to moorings below the dam. This exploit gained for young Lincoln the enthusiastic admiration of his employer, and turned his own mind in the direction of an invention

which he afterwards patented "for lifting vessels over shoals." The model on which he obtained this patent,—a little boat whittled by his own hand in 1849, after he had become prominent as a lawyer and politician,—is still shown to visitors at the Department of the Interior. We have never learned that it has served any other purpose.

They made a quick trip down the Sangamon, the Illinois, and the Mississippi rivers. Although it was but a repetition in great part of the trip young Lincoln had made with Gentry, it evidently created a far deeper impression on his mind than the former one. The simple and honest words of John Hanks leave no doubt of this. At New Orleans, he said, they saw for the first time "negroes chained, maltreated, whipped, and scourged. Lincoln saw it; his heart bled; said nothing much, was silent, looked bad. I can say, knowing it, that it was on this trip that he formed his opinions of slavery. It run its iron in him

then and there, May, 1831. I have heard him say so often."* The sight of men in chains was intolerable to him. Ten years after this he made another journey by water with his friend Joshua Speed, of Kentucky. Writing to Speed about it after the lapse of fourteen years, he says:

"In 1841 you and I had together a tedious low-water trip on a steamboat from Louisville to St. Louis. You may remember, as I well do, that from Louisville to the mouth of the Ohio there were on board ten or a dozen slaves shackled together with irons. That sight was a continual torment to me, and I see something like it every time I touch the Ohio or any other slave border. It is not fair for you to assume that I have no interest in a thing which has, and which continually exercises, the power of making me miserable."

There have been several ingenious attempts to show the origin and occasion of Mr. Lincoln's anti-slavery convictions. They seem to us an idle waste of labor. These sentiments came with the first awakening of his mind and conscience, and were roused into active life and energy by the sight of fellow-creatures in chains on the wharf at New Orleans.

The party went up the river in the early summer, and separated in St. Louis. Abraham walked in company with John Johnston from St. Louis to Coles County, and spent a few weeks there with his father, who had made another migration the year before. His final move was to Goose Nest Prairie, where he died in 1851,† at the age of seventy-three years, after a life which, though not successful in any material or worldly point of view, was probably far happier than that of his illustrious son, being unvexed by enterprise or ambition. Abraham never lost sight of his parents. He continued to aid and befriend them in every way, even when he could ill afford it, and when his benefactions were imprudently used. He not only comforted their declining years with every aid his affection could suggest, but he did everything in his power to assist his stepbrother Johnston, a hopeless task enough. The following rigidly truthful and yet kindly letters will show how mentor-like and masterful, as well as generous, were the relations that Mr. Lincoln held to these friends and companions of his childhood:

"DEAR JOHNSTON: Your request for eighty dollars I do not think it best to comply with now. At the various times when I have helped you a little, you have said to me, 'We can get along very well now,' but in a very short time I find you in the same difficulty again. Now this can only happen by some de-

fect in your conduct. What that defect is I think I know. You are not *lazy* and still you are an *idler*. I doubt whether, since I saw you, you have done a good whole day's work in any one day. You do not very much dislike to work, and still you do not work much, merely because it does not seem to you that you could get much for it. This habit of uselessly wasting time is the whole difficulty, and it is vastly important to you, and still more so to your children, that you should break the habit. It is more important to them because they have longer to live, and can keep out of an idle habit before they are in it easier than they can get out after they are in.

"You are now in need of some money; and what I propose is that you shall go to work 'tooth and nail' for somebody who will give you money for it. Let father and your boys take charge of things at home, prepare for a crop, and make the crop; and you go to work for the best money wages, or in discharge of any debt you owe, that you can get; and to secure a fair reward for your labor, I now promise you that for every dollar you will, between this and the first of next May, get for your own labor, either in money or as discharging your own indebtedness, I will then give you one other dollar. By this, if you hire yourself at ten dollars a month, from me you will get ten more, making twenty dollars a month for your work. In this I do not mean that you shall go off to St. Louis, or the lead mines, or the gold mines in California; but I mean for you to go at it for the best wages you can get close to home, in Coles County. Now, if you will do this you will soon be out of debt, and, what is better, you will have a habit that will keep you from getting in debt again. But if I should now clear you out of debt, next year you would be just as deep in as ever. You say you would almost give your place in heaven for seventy or eighty dollars. Then you would value your place in heaven very cheap, for I am sure you can, with the offer I make, get the seventy or eighty dollars for four or five months' work. You say if I will furnish you the money you will deed me the land, and if you don't pay the money back you will deliver possession. Nonsense. If you can't live now with the land, how will you then live without it? You have always been kind to me, and I do not mean to be unkind to you. On the contrary, if you will but follow my advice, you will find it worth more than eighty times eighty dollars to you."

Here is a later epistle, still more graphic and terse in statement, which has the unusual merit of painting both confessor and penitent to the life:

"SHELBYVILLE, Nov. 4, 1851.

"DEAR BROTHER: When I came into Charleston, day before yesterday, I learned that you are anxious to sell the land where you live and move to Missouri. I have been thinking of this ever since, and cannot but think such a notion is utterly foolish. What can you do in Missouri better than here? Is the land any richer? Can you there, any more than here, raise corn and wheat and oats without work? Will anybody there, any more than here, do your work for you? If you intend to go to work, there is no better place than right where you are; if you do not intend to go to work, you cannot get along anywhere. Squirming and crawling about from place to place can do no good. You have raised no crop this year, and what you really want is to sell the land, get the money, and spend it. Part with the land you have, and, my life upon it, you will never after own a spot big enough to bury you in. Half you will get for the land you will spend in moving to Missouri, and the other half you will eat and drink and wear out, and no foot of land will be bought. Now, I feel it is my duty to have no hand in such a piece

* Lamon, p. 83.

† His grave, a mile and a half west of the town of Farmington, Illinois, is surmounted by an appropriate monument erected by his grandson, the Hon. Robert T. Lincoln.

of foolery. I feel that it is so even on your own account, and particularly on mother's account. The eastern forty acres I intend to keep for mother while she lives; if you will not cultivate it, it will rent for enough to support her; at least, it will rent for something. Her dower in the other two forties she can let you have, and no thanks to me. Now, do not misunderstand this letter. I do not write it in any unkindness. I write it in order, if possible, to get you to face the truth, which truth is, you are destitute because you have idled away all your time. Your thousand pretenses deceive nobody but yourself. Go to work is the only cure for your case."

A volume of disquisition could not put more clearly before the reader the difference between Abraham Lincoln and the common run of Southern and Western rural laborers.

He had the same disadvantages that they had. He grew up in the midst of poverty and ignorance; he was poisoned with the enervating malaria of the Western woods, as all his fellows were, and the consequences of it were seen in his character and conduct to the close of his life. But he had, what very few of them possessed any glimmering notion of, a fixed and inflexible will to succeed. He did not love work, probably, any better than John Johnston; but he had an innate self-respect, and a consciousness that his self was worthy of respect, that kept him from idleness as it kept him from all other vices, and made him a better man every year that he lived.

(To be continued.)

ON THE LIFE-MASK OF ABRAHAM LINCOLN.

THIS bronze doth keep the very form and mold
 Of our great martyr's face. Yes, this is he :
 That brow all wisdom, all benignity ;
 That human, humorous mouth ; those cheeks that hold
 Like some harsh landscape all the summer's gold ;
 That spirit fit for sorrow, as the sea
 For storms to beat on ; the lone agony
 Those silent, patient lips too well foretold.
 Yes, this is he who ruled a world of men
 As might some prophet of the elder day,—
 Brooding above the tempest and the fray
 With deep-eyed thought and more than mortal ken.
 A power was his beyond the touch of art
 Or armed strength : It was his mighty heart.

R. W. Gilder.

THE QUESTIONER OF THE SPHINX.

BEHOLD me ! with swift foot across the land,
 Where desert winds are sleeping, I am come
 To wrest a secret from thee ; O thou, dumb,
 And careless of my puny lips' command.
 Cold orbs ! *mine* eyes a weary world have scanned.
 Slow ear ! in *mine* rings ever a vexéd hum
 Of sobs and strife. Of joy, mine earthly sum
 Is buried as thy form in burning sand.
 The wisdom of the nations thou hast heard ;
 The circling courses of the stars hast known.
 Awake ! Thrill ! By my feverish presence stirred,
 Open thy lips to still my human moan,
 Breathe forth one glorious and mysterious word,
 Though I should stand, in turn, transfixed,— a stone !

M. Virginia Donaghe.

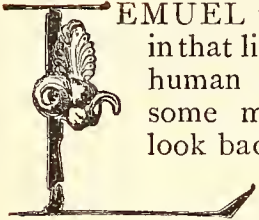

THE MINISTER'S CHARGE;

OR, THE APPRENTICESHIP OF LEMUEL BARKER.*

BY W. D. HOWELLS,

Author of "Venetian Life," "A Modern Instance," "The Rise of Silas Lapham," etc.

XXVIII.

EMUEL went through the next day in that license of revolt which every human soul has experienced in some measure at some time. We look back at it afterwards, and see it a hideous bondage. But for the moment Lemuel rejoiced in it; and he abandoned himself boldly to thoughts that had hitherto been a furtive and trembling rapture.

In the afternoon, when he was most at leisure, he walked down to the Public Garden, and found a seat on a bench near the fountain where the Venus had shocked his inexperience the first time he saw her; he remembered that simple boy with a smile of pity, and then went back into his cloud of revery. There, safely hid from trouble and wrong, he told his ideal how dear she was to him, and how she had shaped and governed his life, and made it better and nobler from the first moment they had met. The fumes of the romances which he had read mixed with the love-born delirium in his brain: he was no longer low, but a hero of lofty line, kept from his rightful place by machinations that had failed at last, and now he was leading her, his bride, into the ancient halls which were to be their home, and the source of beneficence and hope to all the poor and humbly-born around them. His eyes were so full of this fantastic vision, the soul of his youth dwelt so deeply within this dream-built tabernacle, that it was with a shock of anguish he saw coming up the walk towards him the young girl herself. His airy structure fell in ruins around him; he was again common and immeasurably beneath her; she was again in her own world, where, if she thought of him at all, it must be as a squalid vagabond and the accomplice of a thief. If he could have escaped, he would, but he could not move; he sat still and waited, with fallen eyes, for her to pass him.

At sight of him she hesitated and wavered; then she came towards him, and at a second impulse held out her hand, smiling with a radiant pleasure.

"I didn't know it was you, at first," she

said. "It seems so strange to see any one that I know!"

"I didn't expect to see you, either," he stammered out, getting somehow upon his feet and taking her hand, while his face burned, and he could not keep his eyes on hers; "I — didn't know you were here."

"I've only been here a few days. I'm drawing at the Museum. I've just got back. Have you been here all summer?"

"Yes — all summer. I hope you've been well — I suppose you've been away —"

"Yes, I've just got back," she repeated.

"Oh, yes! I meant that!"

She smiled at his confusion, as kindly as the ideal of his day-dream. "I've been spending the summer with Madeline, and I've spent most of it out-of-doors, sketching. Have you been well?"

"Yes — not very; oh, yes, I'm well —" She had begun to move forward with the last question, and he found himself walking with her. "Did she — has Miss Swan come back with you?" he asked, looking her in the eyes with more question than he had put into his words.

"No, I don't think she'll come back this winter," said the girl. "You know," she went on, coloring a little, "that she's married now?"

"No," said Lemuel.

"Yes. To Mr. Berry. And I have a letter from him for you."

"Was he there with you, this summer?" asked Lemuel, ignoring alike Berry's marriage and the letter from him.

"Oh, yes; of course! And I liked him better than I used to. He is very good, and if Madeline didn't have to go so far West to live! He will know how to appreciate her, and there are not many who can do that! Her father thinks he has a great deal of ability. Yes, if Madeline *had* to get married!"

She talked as if convincing and consoling herself, and there was an accent of loneliness in it all that pierced Lemuel's preoccupation; he had hardly noted how almost pathetically glad she was to see him. "You'll miss her here," he ventured.

"Oh, I don't dare to think of it!" cried the girl. "I don't know what I shall do! When I first saw you, just now, it brought up Madeline

and last winter so that it seemed too much to bear !”

They had walked out of the Garden across Charles street, and were climbing the slope of Beacon street Mall, in the Common. “I suppose,” she continued, “the only way will be to work harder, and try to forget it. They wanted me to go out and stay with them ; but of course I couldn’t. I shall work, and I shall read. I shall not find another Madeline Swan ! You must have been reading a great deal this summer, Mr. Barker,” she said, in turning upon him from her bereavement. “Have you seen any of the old boarders ? Or Mrs. Harmon ? I shall never have another winter like that at the poor old St. Albans !”

Lemuel made what answer he could. There was happiness enough in merely being with her to have counterbalanced all the pain he was suffering ; and when she made him partner of her interests and associations, and appealed to their common memories in confidence of his sympathy, his heavy heart stirred with strange joy. He had supposed that Berry must have warned her against him ; but she was treating him as if he had not. Perhaps he had not, and perhaps he had done so, and this was her way of showing that she did not believe it. He tried to think so ; he knew it was a subterfuge, but he lingered in it with a fleeting, fearful pleasure. They had crossed from the Common, and were walking up under the lindens of Chestnut street, and from time to time they stopped in the earnestness of their parley, and stood talking, and then loitered on again, in the summer security from oversight which they were too rapt to recognize. They reached the top of the hill, and came to a door where she stopped. He fell back a pace. “Good-bye —” It was eternal loss, but it was escape.

She smiled in timorous hesitation. “Won’t you come in ? And I will get Mr. Berry’s letter.”

She opened the door with a latch-key, and he followed her within ; a servant girl came half-way up the basement stairs to see who it was, and then went down. She left him in the dim parlor a moment, while she went to get the letter. When she returned, “I have a little room for my work at the top of the house,” she said, “but it will never be like the St. Albans. There’s no one else here yet, and it’s pretty lonesome — without Madeline.”

She sank into a chair, but he remained standing, and seemed not to heed her when she asked him to sit down. He put Berry’s letter into his pocket without looking at it, and she rose again.

She must have thought he was going, and she said, with a smile of gentle trust, “It’s been like having last winter back again to see

you. We thought you must have gone home right after the fire ; we didn’t see anything of you again. We went ourselves in about a week.”

Then she did not know, and he must tell her himself.

“Did Mr. Berry say anything about me — at the fire — that last day ?” he began bluntly.

“No !” she said, looking at him with surprise ; there was a new sound in his voice. “He had no need to say anything ! I wanted to tell you — to write and tell you — how much I honored you for it — how ashamed I was for misunderstanding you just before, when —”

He knew that she meant when they all pitied him for a coward.

Her voice trembled ; he could tell that the tears were in her eyes. He tried to put the sweetness of her praise from him. “Oh, it wasn’t that that I meant,” he groaned ; and he wrenched the words out. “That fellow who said he was a friend of mine, and got into the house that way, was a thief ; and Mr. Berry caught him robbing his room the day of the fire, and treated me as if I knew it, and was helping him on —”

“Oh !” cried the girl. “How cruel ! How could he do that ?”

Lemuel could not suffer himself to take refuge in her generous faith now.

“When I first came to Boston I had my money stolen, and there were two days when I had nothing to eat ; and then I was arrested by mistake for stealing a girl’s satchel ; and when I was acquitted, I slept the next night in the tramps’ lodging-house, and that fellow was there, and when he came to the St. Albans I was ashamed to tell where I had known him, and so I let him pass himself off for my friend.”

He kept his eyes fixed on hers, but he could not see them change from their pity of him, or light up with a sense of any squalor in his history.

“And I used to think that *my* life had been hard !” she cried. “Oh, how much you have been through !”

“And after that,” he pursued, “Mr. Sewell got me a place, a sort of servant’s place, and when I lost that I came to be the man-of-all-work at the St. Albans.”

In her eyes the pity was changing to admiration ; his confession which he had meant to be so abject had kindled her fancy like a boastful tale.

“How little we know about people and what they have suffered ! But I thank you for telling me this — oh, yes ! — and I shall always think of myself with contempt. How easy and pleasant my life has been ! And you —”

She stopped, and he stood helpless against

her misconception. He told her about the poverty he had left at home, and the wretched circumstance of his life, but she could not see it as anything but honorable to his present endeavor. She listened with breathless interest to it all, and, "Well," she sighed at last, "it will always be something for you to look back to, and be proud of. And that girl—did she never say or do anything to show that she was sorry for that cruel mistake? Did you ever see her afterwards?"

"Yes," said Lemuel, sick at heart, and feeling how much more triumphantly he could have borne ignominy and rejection than this sweet sympathy. She seemed to think he would say something more, but he turned away from her, and after a little silence of expectation she let him go, with promises to come again which she seemed to win from him for his own sake.

In the street he took out Berry's letter and read it.

"DEAR OLD MAN: I've been trying to get off a letter to you almost any time the last three months, but I've been round so much, and upside down so much since I saw you—out to W. T. and on my head in Western Mass.—that I've not been able to fetch it. I don't know as I could fetch it now, if it wasn't for the prospective Mrs. A. W. B., Jr., standing over me with a revolver, and waiting to see me do it. I've just been telling her about that little interview of ours with Williams, that day, and she thinks I ought to be man enough to write and say that I guess I was all wrong about you; I had a sneaking idea of the kind from the start almost, but if a fellow's proud at all, he's proud of his mistakes, and he hates to give them up. I'm pretty badly ball'd up, now, and I can't seem to get the right words about remorse, and so forth; but you know how it is yourself. I *am* sorry, there's no two ways about that; but I've kept my suspicions as well as my regrets to myself, and now I do the best thing I can by way of reparation. I send this letter by Miss Carver. She hasn't read it, and she don't know what it's all about; but I guess you'd better tell her. Don't spare yours truly,

"A. W. BERRY, JR."

The letter did not soften Lemuel at all towards Berry, and he was bitterly proud that he had spoken without this bidding, though he had seemed to speak to no end that he had expected. After a while he lost himself in his day-dreams again, and in the fantastic future which he built up this became a great source of comfort to him and to his ideal. Now he parted with her in sublime renunciation, and now he triumphed over all the obstacles between them; but, whatever turn he willed his fortunes to take, she still praised him, and he prided himself that he had shown himself at his worst to her of his own free impulse. Sewell praised him for it in his reverie; Mr. Corey and Mr. Bellingham both made him delicate compliments upon his noble behavior, which he feigned had somehow become known to them.

At the usual hour he was at Mr. Corey's house, where he arrived footsore and empty from supperless wanderings, but not hungry and not weary. The serving-man at the door met him with the message that Mr. Corey had gone to dine at his club and would not be at home till late. He gave Lemuel a letter, which had all the greater effect from being presented to him on the little silver tray employed to bring up the cards and notes of the visitors and correspondents of the family. The envelope was stamped in that ephemeral taste which configured the stationery of a few years ago with the lines of alligator leather, and it exhaled a perfume so characteristic that it seemed to breathe Statira visibly before him. He knew this far better than the poor, scrawly, uncultivated handwriting which he had seen so little. He took the letter, and, turning from the door, read it by the light of the next street lamp.

"Dear Lemuel—Manda Grier has told me what she said to you and Ime about crazy about it dear Lem I want you should come and see mee O Lem you dont Suppose i could of let Manda Grier talk to you that way if I had of none it but of course you didnt only do Say so I give her a real good goen over and she says shes sory she done it i dont want any body should care for mee without itse there free will but-I shall alwayes care for you if you dont care for me dont come but if you do Care I want you should come as soon as ever you can I can explane everything Manda Grier didnt mean anything but for the best but sometimes she dont know what she is sayin O Lem you mussent be mad But if you are and you dont want to come ennymore dont come But O i hope you wouldnt let such a thing set you againste mee recollect that I never done or Said anything to set you against me.

"STATIRA."

A cruel disgust mingled with the remorse that this letter brought him. Its illiteracy made him ashamed, and the helpless fondness it expressed was like a millstone hanged about his neck. He felt the deadly burden of it drag him down.

A passer-by on the other side of the street coughed slightly in the night air, and a thought flashed through Lemuel, from which he cowered as if he had found himself lifting his hand against another's life.

His impulse was to turn and run, but there was no escape on any side. It seemed to him that he was like that prisoner he had read of, who saw the walls of his cell slowly closing together upon him, and drawing nearer and nearer till they should crush him between them. The inexperience of youth denies it perspective; in that season of fleeting and unsubstantial joys, of feverish hopes, despair wholly darkens a world which after years find full of chances and expedients.

If Mr. Sewell had been in town there might have been some hope through him; or if Mr. Evans were there; or even if Berry were at hand, it would be some one to advise with, to open his heart to in his extremity. He walked down into Bolingbroke street, knowing well that Mr. Sewell was not at home, but pretending to himself, after the fashion of the young, that if he should see a light in his house it would be a sign that all should come out right with him, and if not, it would come out wrong. He would not let himself lift his eyes to the house front till he arrived before it. When he looked his heart stood still; a light streamed bright and strong from the drawing-room window.

He hurried across the street and rang; and after some delay, in which the person coming to the door took time to light the gas in the hall, Mr. Sewell himself opened to him. They stood confronted in mutual amazement, and then Sewell said, with a cordiality which he did not keep free from reluctance, "Oh—Mr. Barker! Come in! Come in!" But after they had shaken hands, and Lemuel had come in, he stood there in the hall with him, and did not offer to take him up to his study. "I'm so glad to have this glimpse of you! How in the world did you happen to come?"

"I was passing and saw the light," said Lemuel.

Sewell laughed. "To be sure! We never have any idea how far our little candle throws its beams! I'm just here for the night, on my way from the mountains to the sea; I'm to be the 'supply' in a friend's pulpit at New Bedford; and I'm here quite alone in the house, scrambling a sermon together. But I'm so glad to see you! You're well, I hope? You're looking a little thin, but that's no harm. Do you enjoy your life with Mr. Corey? I was sure you would. When you come to know him, you will find him one of the best of men—kindly, thoughtful, and sympathetic. I've felt very comfortable about your being with him, whenever I've thought of you, and you may be sure that I've thought of you often. What about our friends of the St. Albans? Do you see Mrs. Harmon? You knew the Evanses had gone to Europe."

"Yes; I got a letter from him yesterday."

"He didn't pick up so fast as they hoped, and he concluded to try the voyage. I hear very good accounts of him. He said he was going to write you. Well! And Mr. Corey is well?" He smiled more beamingly upon Lemuel, who felt that he wished him to go, and stood haplessly trying to get away.

In the midst of his own uneasiness Sewell noted Lemuel's. "Is there anything—something—you wished to speak with me about?"

"No. No, not anything in particular. I just saw the light, and ——"

Sewell took his hand and wrung it with affection. "It was so good of you to run in and see me. Don't fancy it's been any disturbance. I'd got into rather a dim place in my work, but since I've been standing here with you—ha, ha, ha! those things do happen so curiously!—the whole thing has become perfectly luminous. I'm delighted you're getting on so nicely. Give my love to Mr. Corey. I shall see you soon again. We shall all be back in a little over a fortnight. Glad of this moment with you, if it's *only* a moment! Good-bye!"

He wrung Lemuel's hand again, this time in perfect sincerity, and eagerly shut him out into the night.

The dim place had not become so luminous to him as it had to the minister. A darkness, which the obscurity of the night faintly typified, closed round him, pierced by one ray only, and from this he tried to turn his face. It was the gleam that lights up every labyrinth where our feet wander and stumble, but it is not always easy to know it from those false lights of feeble-hearted pity, of mock-sacrifice, of sick conscience, which dance before us to betray to worse misery yet.

Some sense of this, broken and faltering, reached Lemuel where he stood, and tried to deal faithfully with his problem. In that one steadfast ray he saw that whatever he did he must not do it for himself; but what his duty was he could not make out. He knew now, if he had not known before, that whatever his feeling for Statira was, he had not released himself from her, and it seemed to him that he could not release himself by any concern for his own advantage. That notion with which he had so long played, her insufficiency for his life now and for the needs of his mind hereafter, revealed itself in its real cruelty. The things that Mr. Sewell had said, that his mother had said, that Berry had said, in what seemed a fatal succession, and all to the same effect, against throwing himself away upon some one inadequate to him at his best, fell to the ground like withered leaves, and the fire of that steadfast ray consumed them.

But whom to turn to for counsel now? The one friend in whom he had trusted, to whom he had just gone ready to fling down his whole heart before him, had failed him, failed him unwittingly, unwillingly, as he had failed him once before, but this time in infinitely greater stress. He did not blame him now, fiercely, proudly, as he had once blamed him, but again he wandered up and down the city streets, famished and outcast through his defection.

It was late when he went home, but Mr. Corey had not yet returned, and he had time

to sit down and write the letter which he had decided to send to Statira, instead of going to see her. It was not easy to write, but after many attempts he wrote it.

"DEAR STATIRA: You must not be troubled at what Amanda said to me. I assure you that, although I was angry at first, I am entirely willing to overlook it at your request. She probably spoke hastily, and I am now convinced that she spoke without your authority. You must not think that I am provoked at you.

"I received your letter this evening; and I will come to see you very soon.

"LEMUEL BARKER."

The letter was colder than he meant to make it, but he felt that he must above all be honest, and he did not see how he could honestly make it less cold. When it came to Statira's hands she read it silently to herself, over and over again, while her tears dripped upon it.

'Manda Grier was by, and she watched her till she could bear the sight no longer. She snatched the letter from the girl's hands, and ran it through, and then she flung it on the ground. "Nasty, cold-hearted, stuck-up, shameless thing!"

"Oh, don't, 'Manda; don't, 'Manda!" sobbed Statira, and she plunged her face into the pillows of the bed where she sat.

"Shameless, cold-hearted, stuck-up, nasty thing!" said 'Manda Grier, varying her denunciation in the repetition, and apparently getting fresh satisfaction out of it in that way. "Don't? St'ira Dudley, if you was a woman — if you was *half* a woman — you'd never speak to that little corpse-on-ice again."

"Oh, 'Manda, don't call him names! I can't bear to have you!"

"Names? If you was anybody at all, you wouldn't *look* at him! You wouldn't *think* of him!"

"Oh, 'Manda, 'Manda! You know I can't let you talk so," moaned Statira.

"Talk? I could talk my *head* off! 'You must not think I was provoked with you,' " she mimicked Lemuel's dignity of diction in mincing falsetto. "'I will come to see you very soon.' Miserable, worthless, conceited whipper-snapper!"

"Oh, 'Manda, you'll break my heart if you go on so!"

"Well, then, give him up! He's goin' to give you up."

"Oh, he ain't; you know he ain't! He's just busy, and I know he'll come. I'll bet you he'll be here to-morrow. It'll kill me to give him up."

She had lifted herself from the pillow, and she began to cough.

"He'll kill you anyway," cried 'Manda

Grier, in a passion of pity and remorse. She ran across the room to get the medicine which Statira had to take in these paroxysms. "There, there! Take it! I sha'n't say anything more about him."

"And do you take it all back?" gasped Statira, holding the proffered spoon away.

"Yes, yes! But *do* take your med'cine, St'ira, 'f you don't want to die where you set."

"And do you think he'll come?"

"Yes, he'll come."

"Do you say it just to get me to take the medicine?"

"No, I really do believe he'll come."

"Oh, 'Manda, 'Manda!" Statira took her medicine, and then wildly flung her arms round 'Manda Grier's neck, and began to sob and to cry there. "Oh, how hard I *am* with you, 'Manda! I should think if I *was* as hard with everybody else, they'd perfectly hate me."

"*You* hard!"

"Yes, and that's why he hates me. He does hate me. You said he did."

"No, St'ira, I didn't. You never was hard to anybody, and the meanest old iceberg in creation couldn't hate you."

"Then you think he does care for me?"

"Yes."

"And you know he'll come soon?"

"Yes."

"To-morrow?"

"Yes, to-morrow."

"Oh, 'Manda, oh, 'Manda!"

xxx.

LEMUEL had promised himself that if he could gain a little time he should be able better to decide what it was right for him to do. His heart lifted as he dropped the letter into the box, and he went through the chapters which Mr. Corey asked him to read, after he came in, with an ease incredible to himself. In the morning he woke with a mind that was almost cheerful. He had been honest in writing that letter, and so far he had done right; he should keep his word about going soon to see Statira, and that would be honest too. He did not look beyond this decision, and he felt as we all do more or less vaguely when we have resolved to do right, that he had the merit of a good action.

Statira showed herself so glad to see him that he could not do less than seem to share her joy in their making-up, as she called it, though he insisted that there had been no quarrel between them; and now there began for him a strange double life, the fact of which each reader must reject or accept according to the witness of his own knowledge.

He renewed as far as he could the old

warmth of his feeling for Statira, and in his compunction experienced a tenderness for her that he had not known before, the strange tenderness that some spirits feel for those they injure. He went oftener than ever to see her, he was very good to her, and cheered her with his interest in all her little interests; he petted her and comforted her; but he escaped from her as soon as he could, and when he shut her door behind him he shut her within it. He made haste to forget her, and to lose himself in thoughts that were never wholly absent even in her presence. Sometimes he went directly from her to Jessie, whose innocent Bohemianism kept later hours, and who was always glad to see him whenever he came. She welcomed him with talk that they thought related wholly to the books they had been reading, and to the things of deep psychological import which they suggested. He seldom came to her without the excuse of a book to be lent or borrowed; and he never quitted her without feeling inspired with the wish to know more and to be more: he seemed to be lifted to purer and clearer regions of thought. She received him in the parlor, but their evenings commonly ended in her little studio, whither some errand took them, or some intrusion of the other boarders banished them. There he read to her poems or long chapters out of the essayists or romancers; or else they sat and talked about the strange things they had noticed in themselves that were like the things they found in their books. Once when they had talked a long while in this strain, he told how when he first saw her he thought she was very proud and cold.

She laughed gayly. "And I used to be afraid of you," she said. "You used to be always reading there in your little office. Do you think I'm very proud now?"

"Are you very much afraid of me now?" he retorted.

They laughed together.

"Isn't it strange," she said, "how little we really know about people in the world?"

"Yes," he answered. "I wonder if it will ever be different. I've been wrong about nearly every one I've met since I came to Boston."

"And I have too!" she cried, with that delight in the coincidence of experience which the young feel so keenly.

He had got the habit with his growing ease in her presence, of walking up and down the room, while she sat, forgetful of everything but the things they were saying, and followed him with her eyes. As he turned about in his walk, he saw how pretty she was, with her slender form cased in the black silk she wore.

Her eyes were very bright, and her soft lips, small and fine, were red.

He faltered, and lost the thread of his speech. "I forgot what I was going to say!"

She clasped her hands over her laughing face a moment. "And I don't remember what you were saying!" They both laughed a long time at this; it seemed incomparably droll, and they became better comrades.

They spent the rest of the evening in laughing and joking.

"I didn't know you were so fond of laughing," he said, when he went away.

"And I always supposed you were very solemn," she replied.

This again seemed the drollest thing in the world.

"Well, I always was," he said.

"And I don't know when I've laughed so much before!" She stood at the head of the stairs, and held her lamp up for him to find his way down.

Again looking back, he saw her in the grace that had bewildered him before.

When he came next they met very seriously, but before the evening was past they were laughing together; and so it happened now whenever he came. They both said how strange it was that laughing with any one seemed to make you feel so much better acquainted. She told of a girl at school that she had always disliked till one day something made them laugh, and after that they became the greatest friends.

He tried to think of some experience to match this, but he could not; he asked her if she did not think that you always felt a little gloomy after you had been laughing a great deal. She said, yes; after that first night when they laughed so, she felt so depressed that she was sure she was going to have bad news from Madeline. Then she said she had received a letter from Madeline that morning, and she and Mr. Berry had both wished her to give him their regards if she ever saw him. This, when she had said it, seemed a very good joke too; and they laughed at it a little consciously, till he boldly bade her tell them he came so very seldom that she did not know when she could deliver their message.

She answered that she was afraid Madeline would not believe that; and then it came out that he had never replied to Berry's letter.

She said, "Oh! Is that the way you treat your correspondents?" and he was ashamed to confess that he had not forgiven Berry.

"I will write to him to-night, if you say so," he answered hardily.

"Oh, you must do what you think best," she said, lightly refusing the responsibility.

"Whatever you say will be best," he said with a sudden, passionate fervor that surprised himself.

She tried to escape from it. "Am I so infallible as that?"

"You are for me!" he retorted.

A silence followed, which she endeavored to break, but she sat still across the little table from him where the shaded lamp spread its glow, leaving the rest of the room, with its red curtains and its sketches pinned about, in a warm, luxurious shadow. Her eyes fell, and she did not speak.

"It must sound very strange to you, I know," he went on; "and it's strange to me too; but it seems to me that there isn't anything I've done without my thinking whether you would like me to do it."

She rose involuntarily. "You make me ashamed to think that you're so much mistaken about me! I know how we all influence each other — I know I always try to be what I think people expect me to be — I can't be myself — I know what you mean; but you — you must be yourself, and not let —" She stopped in her wandering speech, in strange agitation, and he rose too.

"I hope you're not offended with me!"

"Offended? Why? Why do you — go so soon?"

"I thought you were going," he answered stupidly.

"Why, I'm at *home*!"

They looked at each other, and then they broke into a happy laugh.

"Sit down again! I don't know what I got up for. It must have been to make some tea. Did you know Madeline had bequeathed me her tea-kettle — the one we had at the St. Albans?" She bustled about, and lit the spirit-lamp under the kettle.

"Blow out that match!" he cried. "You'll set your dress on fire!" He caught her hand, which she was holding with the lighted match in it at her side, after the manner of women with lighted matches, and blew it out himself.

"Oh, thank you!" she said indifferently. "Can you take it without milk?"

"Yes, I like it so."

She got out two of the cups he remembered, and he said, "How much like last winter that seems!"

And "Yes, doesn't it?" she sighed.

The lamp purred and fretted under the kettle, and in the silence in which they waited, the elm tree that rose from the pavement outside seemed to look in consciously upon them.

When the kettle began to sing, she poured out the two cups of tea, and in handing him his their fingers touched, and she gave a lit-

tle outcry. "Oh! Madeline's precious cup! I thought it was going to drop!"

The soft night-wind blew in through the elm leaves, and their rustling seemed the expression of a profound repose, an endless content.

XXXI.

THE next night Lemuel went to see Statira, without promising himself what he should say or do, but if he were to tell her everything, he felt that she would forgive him more easily than 'Manda Grier. He was aware that 'Manda always lay in wait for him, to pierce him at every undefended point of conscience. Since the first break with her, there had never been peace between them, and perhaps not kindness for long before that. Whether or not she felt responsible for having promoted Statira's affair with him, and therefore bound to guard her to the utmost from suffering by it, she seemed always to be on the alert to seize any advantage against him. Sometimes Statira accused her of trying to act so hatefully to him that he would never come any more; she wildly blamed her; but the faithful creature was none the less constant and vigilant on that account. She took patiently the unjust reproaches which Statira heaped upon her like a wayward child, and remitted nothing of her suspicion or enmity towards Lemuel. Once, when she had been very bitter with him, so bitter that it had ended in an open quarrel between them, Statira sided with him against her, and when 'Manda Grier flounced out of the room she offered him, if he wished, to break with her, and never to speak to her again, or have anything more to do with such a person. But at this his anger somehow fell; and he said no, she must not think of such a thing; that 'Manda Grier had been her friend long before he was, and that, whatever she said to him, she was always good and true to her. Then Statira fell upon his neck and cried, and praised him, and said he was a million times more to her than 'Manda Grier, but she would do whatever he said; and he went away sick at heart.

When he came now, with his thoughts clinging to Jessie, 'Manda Grier hardly gave him time for the decencies of greeting. She was in a high nervous exaltation, and Statira looked as if she had been crying.

"What's become o' them art-students you used to have 't the St. Albans?" she began, her whopper-jaw twitching with excitement, and her eyes glaring vindictively upon Lemuel.

He had sat down near Statira on the lounge, but she drew a little away from him in a provisional fashion, as if she would first see what came of 'Manda Grier's inquisition.

"Art-students?" he repeated aimlessly, while he felt his color go.

"Yes!" she snapped. "Them girls 't used to be 't the St. Albans, 't you thought so wonderful!"

"I didn't know I thought they were very wonderful."

"Can't you answer a civil question?" she demanded, raising her voice.

"I haven't heard any," said Lemuel with sullen scorn.

"Oh! Well!" she sneered. "I forgot that you've b'en used to goin' with such fine folks that you can't bear to be spoken to in plain English."

"'Manda!" began Statira, with an incipient whimper.

"You be still, S'tira Dudley! Mr. Barker," said the poor foolish thing in the mincing falsetto which she thought so cutting, "have you any idea what's become of your young lady artist friends,—them that took your portrait as a Roman youth, you know?"

Lemuel made no answer whatever, for a time. Then, whether he judged it best to do so, or was goaded to the defiance by 'Manda Grier's manner, he replied, "Miss Swan and Miss Carver? Miss Swan is married, and lives in Wyoming Territory now." Before he had reached the close of the sentence he had controlled himself sufficiently to be speaking quite calmly.

"Oh, indeed, Mr. Barker! And may I ask where Miss Carver is? She merried and livin' in Wyoming Territory too?"

"No," said Lemuel quietly. "She's not married. She's in Boston."

"Indeed! Then it *was* her I see in the Garden to-day, S'tira! She b'en back long, Mr. Barker?"

"About a month, I think," said Lemuel.

"Quite a spell! *You* seen her, Mr. Barker?"

"Yes, quite often."

"I want to know! She still paintin' Roman Boys, Mr. Barker? Didn't seem to make any great out at it last winter! But practice makes perfect, they say. I s'pose *you* seen her in the Garden too?"

"I usually see her at home," said Lemuel. "*You* probably receive your friends on the benches in the Garden, but young ladies prefer to have them call at their residences." He astonished himself by this brutality, he who was all gentleness with Miss Carver.

"Very well, Mr. Barker! That's all right. That's all I wanted to know. Never mind about where I meet my friends. Wherever it is, they're *gentlemen*; and they ain't generally goin' with three or four other girls 't the same time."

"No, one like you would be enough," retorted Lemuel.

Statira sat cowering away from the quarrel, and making little ineffectual starts as if to stay it. Heretofore their enmity had been covert if not tacit, in her presence.

Lemuel saw her wavering, and the wish to show 'Manda his superior power triumphed over every other interest and impulse in him. He got upon his feet. "There is no use in this sort of thing going on any longer. I came here because I thought I was wanted. If it's a mistake, it's easy enough to mend it, and it's easy not to make it again. I wish you good-evening."

Statira sprang from the lounge, and flung her arms around his neck. "No, no! You sha'n't go! You mustn't go, Lem! I know you're all right, and I won't have you talked to so! I ain't a bit jealous, Lem; indeed I ain't. I know you wouldn't fool with me, any more than I would with you; and that's what I tell 'Manda Grier, I'll leave it to her if I don't. I don't care who you go with, and I hain't, never since that first time. I know you ain't goin' to do anything underhanded. Don't go, Lem; oh, *don't* go!"

He was pulling towards the door; her trust, her fond generosity drove him more than 'Manda Grier's cutting tongue: that hurt his pride, his vanity, but this pierced his soul; he had only a blind, stupid will to escape from it.

Statira was crying; she began to cough; she released his neck from her clasp, and reeled backward to the lounge, where she would have fallen, if 'Manda Grier had not caught her. The paroxysm grew more violent; a bright stream of blood sprang from her lips.

"Run! Run for the doctor! Quick, Lemuel! Oh, quick!" implored 'Manda Grier, forgetting all enmity in her terror.

Statira's arms wavered towards him, as if to keep him, but he turned and ran from the house, cowed and conscience-stricken by the sight of that blood, as if he had shed it.

He did not expect to see Statira alive when he came back with the doctor whom he found at the next apothecary's. She was lying on the lounge, white as death, but breathing quietly, and her eyes sought him with an eagerness that turned to a look of tender gratitude at the look they found in his.

The doctor bent over her for her pulse and her respiration; then when he turned to examine the crimson handkerchief which 'Manda Grier showed him, Lemuel dropped on his knees beside her, and put his face down to hers.

With her lips against his cheek, she made, "Don't go!"

And he whispered, "No, I'll not leave you now!"

The doctor looked round with the hand-

kerchief still in his hand, as if doubting whether to order him away from her. Then he mutely questioned 'Manda Grier with a glance which her glance answered. He shrugged his shoulders, with a puzzled sigh. An expression of pity crossed his face, which he hardened

into one of purely professional interest, and he went on questioning 'Manda Grier in a low tone.

Statira had slipped her hand into Lemuel's, and she held it fast, as if in that clasp she were holding on to her chance of life.

(To be continued.)

W. D. Howells.

OLD CHELSEA.

ONE of my earliest London surprises came to me as I walked from Apsley House at Hyde Park corner towards the residence of Charles Reade at Knightsbridge, along the length of Piccadilly, and thence

watched and wondered at the traffic of the frequent turbulent streets turning from that thoroughfare down into Chelsea. It was hard to realize that, only fifty years before, Chelsea was a rustic and retired village far from London; even as was Islington when Charles Lamb, pensioned and set free from his desk in the India House, retired to that rural spot with his sister to live "in a cottage, with a spacious garden," as he wrote, with "the New River, rather elderly by this time, running in front (if a moderate walking pace can be so termed)"; even as was Kensington, "the old court suburb pleasantly situated on the great Western Road," just fifty years ago, when wits and statesmen drove between fields to the rival courts of Gore and of Holland House, and N. P. Willis delighted our grandmothers with his gossip, in the "New York Mirror," about his visits to Lady Blessington and the celebrities who bowed before her. To-day all these villages, along with many more remote, are one with London. Yet, more than any of them, has Chelsea kept its old village character, albeit saving but few of its old village features. Of the many magnificent mansions that once gave it the name of the Village of Palaces, five alone still stand,—Blacklands, Gough, Lindsey, Stanley, and Walpole houses. Blacklands is now a private madhouse, Walpole House the infirmary of Chelsea Hospital, and all are greatly altered. In between them, and away beyond them, streets have been cut and new quarters built,—in part of "genteel" villas and rows of respectable residences, but in great part, also, of cheap dwellings, of small and shabby shops. These extremes go to make much of modern Chelsea utterly uninteresting except mayhap to the collector of rents or to the inspector of nuisances. Yet that which is

truly ancient and honorable has been fondly kept untouched, and not ignobly cleaned, as in next-door Kensington. Alongside this artistic squalor we have the curious contrast of artistic splendor in a blazing, brand-new quarter, of which the sacred center is Tite street. Here, amid much that is good and genuine in our modern manner, there is an aggressive affectation of antiquity, in the little houses and studios on the street, in the grandiose piles of mansions on the embankment front; all in raging red brick, and in the so-called Queen Anne style. The original article, deadly dull and decorous as it may be, has yet its own dignity as a real relic. But this painful pretense of ancient quaintness is a right fashionable quarter; mighty swells dwell here, and here pose some famous *farceurs* in art and literature; here, too, work many earnest men and women, in all walks of life.

Planted at intervals on the slope which rises from the river, as we see it in the olden days, stand the great mansions, set in trim gardens. Back from these isolated houses and between them stretch fair fields and fertile meadows and wooded slopes; and along the river bank runs a row of fishermen's thatched cottages. Here and there on the shore are nestled noted taverns and pleasure-gardens, much frequented by town visitors, coming up the river on excursions—like Pepys, "to make merry at the Swan." The low river shore, planted with lime and plane trees, is protected by a slight embankment, broken here and there by carved gateways, giving entrance to the grand houses, and by water staircases, from which a few country lanes—such as Church lane and Lawrence street of our own time—lead from the river front to the King's Road. This road has been first a foot-path, following the windings of the river a little inland,—worn first, perhaps, by the wandering tribes of Trinobantes,—and had gradually enlarged itself as the country around got cultivated. It led from the village of Whitehall, through the woods and fields, across the tidal swamps and the marsh lands west of Westminster—where now stretches graceful St. James's Park, and

where Belgravia is built so bravely — to the slopes of Chelsea, the first good land alongside the river, and rising fairly above it.

This was the secret of the speedy settlement of this secluded suburb. It was high and healthy, and had easy access to town by the safe, swift, silent highway of the river, when few cared to go by this land road, bad enough at its best, unsafe even in daylight by reason of the foot-pads. It was at last made wide and smooth for his coach by Charles II., who used it as the royal route to Hampton Palace, and called it the King's Private Road. But even that name did not serve to make it safe, and long after Chelsea Hospital was built, its guard nightly patrolled, as an escort for honest travelers, from where Buckingham Palace now stands, across Bloody Bridge,—at the edge of present Pimlico,—and through the Five Fields, “where robbers lie in wait,” as the *Tatler* puts it; for Richard Steele often went by this road to Chelsea, where he had a little house. Sometimes his friend Addison was with him; sometimes the latter walked this way alone to his own home, at the farther end of Chelsea, and once on a moonlight night he strolled out here with Colonel Esmond, you may remember. A few years later, this same walk was frequently taken by Mr. Jonathan Swift, from Mrs. Vanhomrigh's house in Suffolk street, Pall Mall,—where he used to leave his “best gown and periwig,” as he tells Stella,—“and so to Chelsea, a little beyond the Church.”

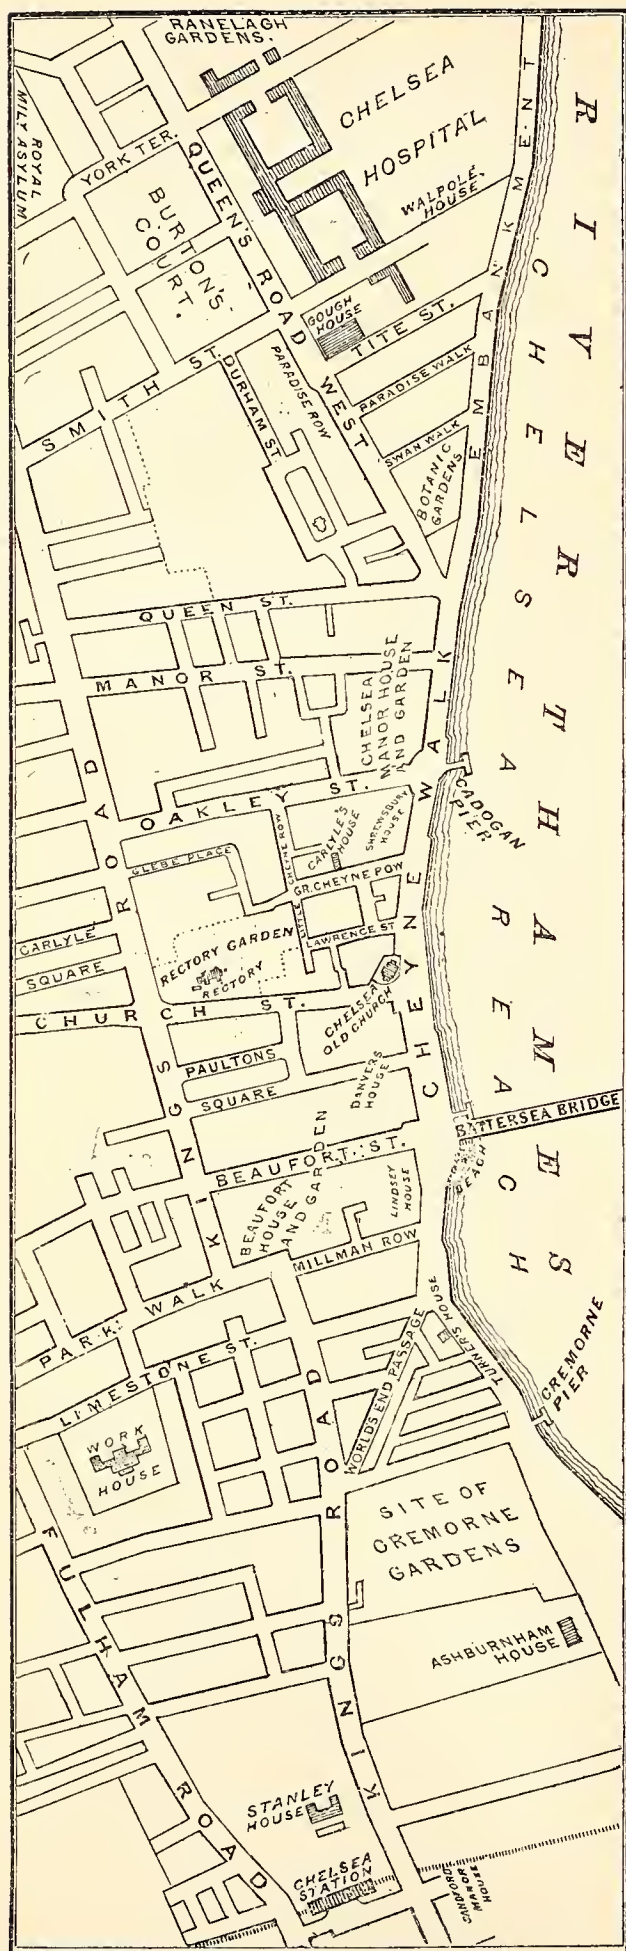

“King's Road,” as we see it to-day, in dingy letters on the old brick or plaster-fronted houses, makes us almost look for the Merry Monarch—as history has misnamed one of her saddest figures—driving past, on his way to Hampton Court, in company with some of those beauties who still lure our senses from out their canvases on the walls of the old palace. As we pass on, here and there a long, low brick house, with old-time porch and square windows and flagged front yard, looks drearily out from behind its rusty railings, as if tired of waiting for its owner to come home from the Dutch wars. Through narrow archways we catch glimpses of trees and of gardens. Turning down a rural lane, we stroll into “The Vale,” and find a clump of cottages, covered with vines, grown about with greenery; flowers blow, cocks crow, an air of country unconcern covers the place. The French gardeners who came here in crowds in 1685, after the revocation of the Edict of Nantes, and set all Chelsea abloom with their nurseries, have left to their heirs but a diminished domain. Yet although Butterfly Alley, sought by sauntering swells, is gone, King's Road is still countrified by its florists: their famous wista-

rias grow on the hospital walls and climb the houses of Cheyne Walk; you still find their fig-trees in private gardens, their vines on old-fashioned trellises; they make Chelsea streets all green and golden with their massed creepers through summer and through autumn. In unexpected corners you will stumble on a collection of cozy cottages, like Camera Square. There are a few rural nooks still left; here and there a woodland walk; and in dairies hid behind stone streets the cow is milked for you while you wait to drink the warm milk.

On the river bank, although the old Roman and the old Norman wall and walk are replaced by the broad new embankment and its trim gardens, although the towering brick affectations of the Queen Anne mania stare stonily down on Cheyne Walk,—all this has not been able to vulgarize that most delightful of promenades. Starting from Chelsea Barracks, we can still walk under the old plane-trees—on our right, the ancient Dutch-fronted houses, so prim, so secluded, so reserved; on our left, the placid flow of the storied Thames, broadened here into Chelsea Reach—to dingy, dear old Battersea Bridge, and so on to Sand's End. At each end of our walk are the two small rivulets which bounded the old parish east and west: one is now arched over and flows unseen beneath the tread of busy feet; the other serves as a railway cutting and carries rattling trains. So the old-time memories of the place now flow under ground or are modernized and part of its daily life.

In the extreme north-eastern corner, as we enter Chelsea, we find Hans Place, a secluded green oval built about with old-time two-storied brick houses, in No. 25 of which—still unaltered—was born the poetess L. E. L.; and at No. 22 she went to school.* At the farthest south-western point of the parish, just over on the borders of Fulham, stands the old house once tenanted by Nell Gwynne. At the northern end of Church street, opposite the Jewish burial-ground, stands a public-house, The Queen's Elm, perpetuating the memory of the elm-tree, there standing until very lately, under which Queen Elizabeth sought shelter from a shower, when strolling in the fields with Burleigh, on one of her frequent visits to Chelsea. On the southern, the river border of the parish, lived George Eliot; and here, at No. 4 Cheyne Walk, she died. Between these spots, marked by the memories of these four women, so far apart

* Among her school-fellows, by the bye, was that Miss Roberts who wrote so well on India, and Lady Caroline Lamb, heroine of the scissors-stabbing scene for Byron's sake. Later we find among the scholars here other famous names: Miss M. R. Mitford, Mrs. S. C. Hall, and Lady Bulwer.—B. E. M.

THE RIVER FRONT OF CHELSEA.

in time, rank, and character, how much of history and romance do we traverse!

In taking you for a stroll to-day through Old Chelsea, we will not stop to puzzle over the etymology of the name, whether it came from the Saxon *Chelchythe*, or from *Chesel*, meaning gravel, and *ea*, meaning a bank; nor trace it back to its earliest appearance in Saxon chronicles, in 745, as the Hundred of Ossulston, Middlesex. You may see, if you choose, in the British Museum, the Charter of Edward the Confessor giving the "Manor of Chelsey to the Abbot and Brothers of the Ministers of the West," and by them it was rented for four pounds yearly. But it will not interest us in our stroll to-day to learn that when it was a residence of Offa, King of the Mercians, "there was a 'Geflitfullic' held here"; nor that they had "a contentious synod." We do not partake of the joy of one Maitland, sounding up and down the river, and at last finding, on the eighteenth of September, 1732, the very ford between Chelsea and Battersea traversed by Cæsar's army in pursuit of the flying Britons.

Among the archives of Chelsea there is the will, dated in 1369, of the Earl of Warwick; and we know that long before that year he had come here with the prestige of his prowess at Poitiers, his courage at Cressy, and built himself a house — the first great nobleman's house erected here. But we do not know where it stood, nor anything more of it than that it was afterwards leased by Richard III. to the widowed Duchess of Norfolk for the yearly rental of one red rose.

Sir Thomas More's house is the first, as well as the fullest of human interest, of which there is any authentic record in Chelsea; and it was he who laid the foundations of the prosperity of the place. He built it for himself in 1520, glad to go from narrow Bucklersbury in the city to sweet sights and sounds and air for his young children. For more than two centuries his house stood there, tenanted by many illustrious families, until it was pulled down in 1740. It is not a difficult labor of love to reconstruct it, as Bowack saw it: "this house is between two hundred and three hundred feet in length, has a stately ancient front towards the Thames, also two spacious courtyards, and behind it are *very fine gardens*. It is so pleasantly situated that the late Queen Mary had a great desire to purchase it before King William built Kensington Palace, but was prevented by some secret obstacles." An old view signed "L. Knyff del: 1699," which I have seen, shows us a projecting porch in the center, a dozen or more generous windows on each floor, four of them oriel, with many gables,

A BIT OF OLD CHELSEA REACH. AFTER THE ETCHING BY PERMISSION OF SEYMOUR HAYDEN.

turrets, and a small tower. The back view crowds together in picturesque confusion a mass of casements, jutting pent-houses, crowded gables. Such was "this pore howse in Chelchith," as More dated one of his letters; and Erasmus wrote of it that it was "neither mean nor invidiously grand, and so subject to envy." It stood on the slope a little back from the river, half-way up to the King's Road, about where Beaufort street now runs up; a spacious garden lay in front, wherein the great chancellor was wont to walk, as well as on the gate-house, "which was flatt on the top, leaded, from whence is a most pleasant prospect of the Thames and the fields beyond," in the words of Aubrey. Sometimes he walked with his guest Holbein, sometimes with his friend Ellis Heywood, poet and playwright, who wrote warmly about "this enchanting spot"; sometimes with his king, Henry VIII., who, still posing as a good Catholic and defender of the Faith, used to come up the river, drop in to dinner, and walk afterwards in the garden, his arm about More's neck; More's son-in-law, Roper, records it with delight, "never having seen the King so familiar with any one else, except Wolsey." More knew just what all this was worth, and that his head would count, with the king, for nothing against a French city or citadel, say. But Wolsey's fate, the fate of so many others, warned none of the rest; else could they not have forgotten that to every neck on which had hung that royal ruffian's arm the ax soon came; and that to be his friend was only a little less dangerous than to be his wife.

In this garden were the stocks for heretics and the "Jesus tree," or tree of troth, whereat they were flogged; for More was fond of suppressing heresy, and failing that, he used to suppress the heretics by flinging them into prison. The resolute old Catholic denied that he had ever laid hands on a heretic, but it is certain that some one did so by his orders. Near his house he had built the "newe building" "for the entertainment of distressed old men and women"; and therein was a small chapel, where he spent much time, praying and scourging himself with a knotted cord. The hair shirt which he wore next his skin is still preserved in the convent of Spilsberg. He was fond of assisting in the service at the old church, carrying the cross in the procession, and doing divers duties, "like a parish clerk." One day the Duke of Norfolk, coming out to dine with him, "fortuned to finde him in the quier with a surplisse on his backe, singinge"; at the sight of which servile service the good worldly duke was moved to wrathful remonstrance. Yet this rigidity in religion was but the natural stand of a strong character against the drift of the times and the current that was carrying crowds down with the king, and it narrowed not at all this man's broad spirit, nor touched for the worse his quaint, gentle humor, his fine wit, his sweet and wholesome nature. It was he who had said, in better-balanced days, that "a man might live for the next world, yet be merry withal"; and it is of him that Erasmus writes these beautiful words: "There was not any man living who was so affectionate to his children as he; and he loveth his old wife as

well as if she were a young maid." His was, indeed, an ideal household, into which I like to look: all dwelling together in affectionate amity,—father, mother, the son and his wife, the three daughters and their husbands, with all the grandchildren, and the orphan girl, Margery Giggs, adopted as a daughter by More, "and as dear to him as if she were his own." There is work for all, and "idleness is never seen," Erasmus tells us. All the female folk study too,—a rare thing then, for More was centuries ahead of his time in his larger views of woman's education, as he—the greatest minister of humanism—was in political and in mightier matters. Pithily he put it: "It mattereth not, in harvest time, whether the corn were sown by a man or a woman."

high and lucrative office. Here he bothered no more about public matters, but busied himself with the care of his household, preparing his family and himself for the end which he saw coming. It came soon enough, and when he refused to violate his conscience by acknowledging Henry's supremacy over that of the Pope as head of the Church, and by taking the oath of succession (by which Anne Boleyn's children were to be acknowledged the lawful heirs to the crown), he was carried down the river to the Tower, and there imprisoned for a whole year, in the very cell, it is said, wherein he had sat as grand inquisitor racking heretics. "Very nigh heaven," he said it was. At nine o'clock of the morning of July 16, 1535, he was led to

THE CHELSEA RECTORY.

Around their table met the "best society" of England, and famous foreign guests. Perhaps it was here that Erasmus visited him; and Linacre, Tunstal, Grocyn, Dean Colet—he who founded St. Paul's School, and to listen to whom was to hear Plato talk, said Erasmus—were all frequent guests of More. From this home he was taken to a prison by his good king. He had refused to debase his great office by countenancing the king's divorce, and had stepped down from it on May 16, 1533, with even greater joy than he had stepped up to it, on Wolsey's disgrace, four years previously, and retired to this Chelsea mansion with but one hundred pounds a year income left to him, after so many years of

the block on Tower Hill and there beheaded. His courage and his constancy had never once failed him, save when taken back to his cell after his trial in Westminster Hall, when his favorite daughter, Margaret Roper, waiting among the crowd on Tower Wharf,—learning his sentence by the token of the blade of the headsman's ax turned towards him,—broke through the guards and clung to his neck, kissing him and sobbing, "Oh, my father!" with no other words uttered. Then for a moment the father in him was unmanned, as he moaned "My Meg," and kissed her for the last time. On the last morning he was cheerful and even jocular. "I pray you, master lieutenant," said he, at the scaffold-

THE EMBANKMENT.

steps, "see me safe up, and for my coming down I can shift for myself." He put aside his beard out of the ax's reach, "for *it* has never committed treason"; and so he laid his reverend head on the block—too noble a head to drop in so worthless a cause.

"A dauntless soul erect, who smiled at death," is Thomson's fitting phrase. And Erasmus wrote: "How many souls hath that ax wounded which cut off More's head!"

His burial-place was long a matter of conjecture. In a record, printed in 1726, his great-grandson says: "His trunk was interred in Chelsey Church, near the middle of the south wall"; but other records tell us that the body was buried in the Tower Chapel, and it is certain that no one really knows the truth about this. We do know, however, that his head was exposed on a spike above London Bridge, "where as traytors' heads are sett upon poles; having remained some moneths there, being to be cast into the Thames, because roome should be made for diverse others, who in plentiful sorte suffered martyrdom for the same supremacie"; it was taken away by Margaret Roper, by bribery or stealth, and by her buried "where she thought fittest." This was found to be, in 1835, after just three centuries of doubt, in the vault of the Roper family in St. Dunstan's Church, Canterbury; and there it remains to-day, "in a leaden box something in the shape of a beehive, open in the front, and with an iron grating before it."

And, amid all the thronging shadows which people Chelsea's shore, there walks no more vivid personality than his, as it moves before

us through all his characteristic career: from the day he was taken from his school in Threadneedle street, and made page-boy to Cardinal Morten, who said of him, seeing already his promise of brains and of wit, "This child here waiting at table, whosoever shall live to see it, will prove a marvelous man"; then to Oxford, with his scanty allowance; thence to New Inn and Lincoln's Inn, studying law for his father's sake, albeit he longed for the pulpit; then law-reader of Furnival's Inn, whence he was called to the bar, lived in the old Charter House, patiently practicing his profession, taking "no fees of poor folks, widows, or pupils," becoming known for his capacity, learning, integrity; elected to the House of Commons when only twenty-three, and soon made Speaker; finally rising to the highest place in the realm, that of Lord High Chancellor; and then, as he passed daily to his place on the woolsack, he would stop always before his aged father, who sat as judge of the Court of the King's Bench in William Rufus's Hall at Westminster, and, "reverently kneeling down in the sight of all, ask his blessing."

In the Gallery of Old Masters at Brussels, I found last year, after long searching, a diminutive dark canvas set in a small black frame, six by eight inches, on each side a small gilt column. On its tiny tablet is the inscription: "Holbein le jeune, 1497-1543. Thomas Morus." This most attractive canvas shows a table on which lies a small dog peering at his master, who sits behind; in his right hand, one finger between the leaves, he holds a book; his left hand grips his dark gown at

the neck; a flat cap is on his head; a short, curling beard, steadfast, honest eyes, a plain, resolute, shrewd, strong face,—this is the man “in his habit as he lived” in the later years of his good life.

This portrait, as well as the more famous group of More and his family, now in Nostell Priory, was painted by Hans Holbein,* while the painter was living with More. Holbein had become tired of his dissipated life in

have bought the house and estate; and here her brother, Thomas Sackville, often visited her, and from here many of his letters are dated. Here he may have written his “Gorboduc,” the first English tragedy. It was Sackville who was sent to tell Queen Mary that her sentence was signed, and he it was who saw it executed. Lady Dacre, surviving her husband, willed the place to the great Lord Burleigh; and so it came to his son,

CHEYNE WALK.

Basle and of his wife, and came to England with a letter of introduction to More from Erasmus, whose portrait Holbein had just finished in Basle; and More was so pleased with the man that he gave him a home with him. Here were passed three of the happiest years of the great painter's life, during which he did much good work. His stay here ended only with the murder of his good friend and patron. He then entered the king's service, and there remained until his own death, in 1543.

After More's execution and the confiscation of his property—which is a tautological way of speaking of any of Henry's murders—the house passed through many hands, noble and base, clean and dirty; and while everything is of interest concerning walls which, in Cicero's words, “could give such good reasons for their fame,” it would be but dry detail to follow their forlorn fortunes fully. Of the noblemen and courtiers who dwelt here, few are worthy of notice; but as early as 1586 we find that Lord and Lady Dacre

Lord Robert Cecil, afterwards Earl of Salisbury, who rebuilt the house and improved the place in 1619, so that even then it was “the greatest house in Chelsea,”—so great that, later, James I. found it just the place he wanted for his favorite “Steenie,” first Duke of Buckingham, giving its owner, then Craufield, Earl of Middlesex, snug lodgings in the Tower in exchange. Charles I., as much infatuated with the duke as his royal father had been, gave the estate out and out to him, in 1627; and his it remained until the commonwealth seized on it.

His son, George Villiers, second Duke of Buckingham, a man worthy of, and worse even than his sire, regained the property on the Restoration; but in 1664 it was sold, along with all the other estates of this poor and profligate scoundrel, the lowest and last of the Villiers.

In 1682 the Marquis of Worcester, afterwards Duke of Beaufort, became its owner, and from him it was named Beaufort House

* The painting in the National Portrait Gallery is a copy, by an unknown, withal a skillful, hand, of Holbein's crayon sketch, now in Windsor Castle. Its

most striking feature is More's mouth; these lips seem to speak to us at once with sweetness and with sternness.—B. E. M.

DON SALTERO'S, CHEYNE WALK.

and thereafter always called so. He selected this place that he might live, says Strype, "in an air he thought much healthier, and near enough to the town for business." In 1738 Sir Hans Sloane bought the house and soon after pulled it down, giving the famous Inigo Jones gateway to the Earl of Burlington, who removed it to his gardens at Chiswick, where it stands to-day. It was on meeting its disjointed stones, as they were carted down, that Alexander Pope wrote his well-known lines upon them:

"I was brought from Chelsea last year,
Batter'd with wind and weather;
Inigo Jones put me together;
Sir Hans Sloane
Let me alone;
Burlington brought me hither."

But this gateway is not the only relic of More's mansion; and the persevering prowler may find still another, well worth the search. Where King's Road curves about to Millman Row,—known in the old days as the Lover's Walk, on the old maps a "Way to Little Chelsea,"—an ancient gateway gave entrance to More's back garden and stables, and through it we now pass into the Moravian burial-ground. Here, in the most peaceful spot in all London, lie in rows, men and women on op-

posite sides, our Moravian brothers and sisters, "departed," as their little headstones tell us, in their touching simplicity. Grass grows above them, great trees guard them—trees perhaps planted by More himself. For this was part of the "very fine gardens" which Bowack speaks of; and the massive wall at the farther end was built in the century which saw the Armada. In among the gardens of the houses beyond may be found other bits of wall, all built of very narrow bricks, such as we trace in More's chapel in Chelsea Old Church—bricks made only then, peculiar to that period, not seen since. This largest piece we are looking at is still solid enough, though bulging here and there with its weight of over three hundred years, its bricks black with age and smoke. There are traces of beams set in it, here is a bit of an archway, there the remains of a fireplace. Thomas More's arm rested on this wall; it is part of him, and he mutely bequeaths it to our care. It is well that we should claim salvage for this bit of him thrown upon the beach of Time, with his mark upon it.

The little brick cottage of the keeper of the graveyard is overrun with vines, and answers to the assurance of antiquity of all within the inclosure. The long, low building of one room, formerly serving as the Moravian chapel,

A VIEW IN CHELSEA OLD CHURCH.

is now used for a Sunday-school. As I glance through the windows in this Sunday sunset, I see boys wriggling onboard benches, struggling with big Bible names, mad for the fresh air and the freedom outside; one belated boy trying at the locked gate does not look unhappy at being refused entrance. There are memorial tablets on the chapel walls, two of them bearing the names of the son and daughter of the great Zinzendorf. To tell how these came here I must give you the story of another great Chelsea mansion, Lindsey House.

It still stands diagonally to the river road, just west of the quaint group of houses on the corner of Cheyne Walk and Beaufort street. Its front has been stuccoed and it has been otherwise modernized, but it has not been entirely robbed of its old-fashioned stateliness. The five separate dwellings into which it was long ago divided have harbored some famous tenants,—Martin the painter lived in the center one, which still inherits the old name of Lindsey House; here, too, lived Brunel, the great engineer; Bramah, famous for his locks, in another. It was the Earl of Lindsey who, about 1674, built this grand new mansion on the site of a former house—between Beaufort House, you see, and the river. It remained in his family until 1750, when it was bought by Count Zinzendorf as a residence for himself and the Moravian Brethren, of which he was the head; and at the same time he bought from Sir Hans Sloane the stables of More's mansion, to be used as a chapel, and the garden for a graveyard. Zinzendorf was a man of a rare nature, lifted above all that is petty and paltry in ordinary life; a spiritual knight, he had founded in his youth, at Halle, a sort of knighthood, "The Slaves of Virtue," and also the "Order of the Grain of Mustard

Seed," teaching his disciples there, teaching the Dutchmen in Holland, and the negroes in Pennsylvania, later,—teaching and preaching, all his life, the brotherhood of man, the essential unity of all forms of religion. A true Catholic, his aim in life was to unite all sects. As head and guardian of his little body of Herrn-hutters, he had used his own fortune to buy one hundred thousand acres of land in North Carolina from Lord Granville, in 1749, and in the following year he bought this property at Chelsea. But no part of it now belongs to

the Moravians, except this burial-ground,—still in use, as we have seen, having been exempted by special provision from the Act of 1855, which closed the intermural graveyards of London, by reason of their burying but one body in each grave, and that so deeply.

The name of Pennsylvania, just mentioned, comes to us again as we walk a little farther west, for its famous founder, William Penn, is, oddly enough, associated with the notorious Cremorne Gardens, which lay just here. The very name of this haunt, by a peculiar irony, was derived from the Viscount Cremorne, its former owner, "this most excellent man," known, even as plain Thomas Dawson, before his peerage, as a model of all that was steady and sedate. His second wife was the granddaughter of William Penn, named Philadelphia, from the city of her birth—a good woman, whose "character it was difficult to delineate," her funeral sermon assures us. She, becoming Lady Cremorne, and outliving her husband, inherited this charming villa and grounds, called Chelsea farm, and left it at her death, in 1825, to her nephew, Granville Penn, "one of the Hereditary Governors and Proprietaries of the late Province of Pennsylvania." He soon sold it, and it became a place of drinking and dancing.

Past the prim and proper brick cottages, past the innocent nursery garden, which cover wicked old Cremorne, through new streets and crescents built on the site of the famous Ashburnham estate, out beyond a high brick wall, studded with reserve and respectability, concealing old Stanley House,—once visited by Queen Elizabeth,—we come to the westernmost edge of Chelsea. Standing on the little bridge which carries King's Road across this deep railway cutting into Sand's End, Fulham, we look over to an old plaster-fronted

CHELSEA BRIDGE AND LINDSEY HOUSE.

house, once known as Sandford Manor House. This was one of the many residences of Neil Gwynne, and in it, a hundred years later, lived Joseph Addison. It has been newly plastered, the sloping roof raised a little, and the wings long since torn down, but it has been very slightly modernized, and Mr. McMinn, its occupant, with rare and real reverence has preserved its antique features, the more marked as they stand out against the great gasometers beyond. Within, its square hall retains the old wainscoting, and the staircase remains as when Charles II. rode up on his pony, in a freak. The delightful little back garden is perhaps hardly altered since those days, but the four walnut-trees which Charles is said to have planted in the front garden have gone to decay and have recently been uprooted. At its foot, where now the railway cuts through, once ran "the creek with barges gliding deep, beside the long grass," on the banks of which Addison went bird-nesting for eggs for the young Earl of Warwick. This was when he was thinking of marrying the lad's mother, and the letters—still in existence—which he wrote from here to the little ten-year-old earl are as genuine and charming as anything we have from his pen. One of them begins, "The business of this is to invite you to a concert of music which I have found out in the neighboring wood." I wish space allowed me to quote more of these letters. Although they

are dated simply at Sand's End, none other than Sandford House has ever stood which can fill the description of that country place, "whereto Mr. Addison often retires in summer."

On the corner of the little turning which leads to this house there stands a tavern called "The Nell Gwynne"; this, at the extreme western end of the parish, is matched by another of the same name on its easternmost edge, and between these two public-houses we may track many other foot-prints of this fair lady, "with whom, for all her frailties, the English people can never be angry," as Peter Cunningham well says. She has left her trace on Chelsea, as she left it in her time on the light-minded monarch,—both shown even yet in Chelsea Hospital, according to tradition and popular belief, which credit her with its founding. It is true that Louis XIV. had probably given the notion to the king by his foundation, a few years before, of the *Invalides* as a retreat for French veterans. It is true that as early as 1666 Evelyn had sent to Pepys, as Clerk of Admiralty, a scheme for an infirmary for disabled English sailors; and, in his diary, 1681-82, he says, "This evening Sir Stephen Fox acquainted me again with his Majesty's resolution of proceeding in the erection of a Royal Hospital for emerited soldiers." This may well be, but it is at least plausible and certainly pleasant

to believe that this good-hearted woman, by a judicious and timely movement, brought about a sudden solution of the question which had been only in suspension in the king's mind. The general destitution of the discharged soldiers after the Restoration was a scandal to the king and the country. In olden times such men had found bread and ale and a night's rest in monastic houses; but all this had been done away with by their disso-

albeit his is a memorable figure, gallant in battle, ardent in love, devoted in science. When he laid down the rapier for the retort, the broadsword for the blowpipe, he pursued chemistry even as he had pursued the flying Roundheads at Edge Hill. Later, the buildings, falling to pieces, were used as early as 1653 as a prison for the Dutch taken in the war. John Evelyn, one of the four commissioners in charge of all prisoners of war,

CHELSEA HOSPITAL, RIVER FRONT.

lution. Nell Gwynne had been poor herself, yet, strangely enough, in her prosperity she was always prone to pity poverty. They say that one day a shabby soldier just escaped from Tangiers—probably an impostor—begged at her carriage door, and she drove home and urged the king to do something for these disabled servants of the state.

There was already a building on the ground, then nearly in ruins, and the foundation walls of which may still be seen in the cellar of the chaplain's house. This was King James's college of polemic divinity—"A College of Divines and other Learned Men at Chelsea." It was a failure, for nobody would subscribe, and only one-eighth of the plan was ever built. The Royal Society used the building for a while; in one of its outhouses Prince Rupert invented the drops, which, in Macaulay's words, "have long amused children and puzzled philosophers"; and by which, absurdly enough, his name is still kept alive;

visits his charges on Ash Wednesday, 1665, and writes: "They only complained that their bread was too fine!"

This was the site fixed on for the new infirmary; and in the "Monthly Recorder" of February 17, 1682, you may read: "His Majesty went to Chelsey Colledge to lay the first stone, with several of the nobility, which is a place designed to be built and endowed by His Majesty for the relief of Indigent officers, and Incouragement to serve His Majesty." William and Mary finished the edifice; and it stands—an impressive monument of that union of proportion and fitness by which Christopher Wren gave beauty to the plainest designs—in stately solidity in the midst of its thirty acres of ground. It is handsomely supported, not only by government aid, but by valuable donations. There are nearly eighty thousand out-pensioners and over five hundred inmates, who are divided into companies and do mimic garrison duty

BATTERSEA BRIDGE AND CHURCH, FROM TURNER'S HOUSE.

in memory of their active days. Prints of their popular commanders hang all round the walls of the great hall west of the grand entrance, once a dining-room, now used for reading and smoking. In glass cases are the war medals left by veterans dying with no surviving relatives to claim them. In this hall the body of the great duke lay in state amid the memorials of his victories, guarded by his own veterans, successors of those other veterans, exultant over the news of Waterloo, whom Wilkie had painted, years before, for the duke himself.

Framed on the wall is a record of the battles, sieges, marches of the Coldstream Guards, which tells us that this famous body is the sole surviving representative of the force which

placed Charles II. on the throne, and thus became the nucleus of the standing army of England. The regiment had been formed in 1650 by General George Monk, by drafts of picked men from the various Cromwellian regiments, and made that famous march on the first day of the year 1660 from Coldstream to London, which saved the monarchy and gave the guard its historic name. In the chapel under the tattered battle-flags, drooping, faded, and forlorn, you may see on any Sunday Hubert Herkomer's picture, in life. It is a touching scene, this entry of the veterans into their chapel, preceded by their fife and drum; still more touching, the funeral of one of their dead, as they march painfully from the infirmary, the solitary drummer and fifer play-

STEAMBOAT PIER, OLD BATTERSEA BRIDGE, TWENTY YEARS AGO.

ing the Dead March in Saul. In the quiet old burying-ground hard by they lie compactly enough, the dead soldiers; and among them women who have fought and died in men's attire, their sex unsuspected until their burial.

Not only in this burial-ground, but in the quadrangles and courts, and everywhere about, there rests an air of repose, of forgetfulness of the turbulent world without. Here, about the spacious central quadrangle, on massive wooden benches, loaf and smoke and chat the contented old boys, and growl withal in their content. They decorate the marble statue of Charles II., posing as a Roman, in the center, with oak-garlands on "Oak-Apple-Day," May 29th, the anniversary of his restoration; they wear oak branches in their caps,

an enchanting stillness broods, broken only by the rare rumble of trains on the farther railway-bridge. All things are half hid in the exquisite English haze; it softens every sharpness, harmonizes every harshness, rounds every shape to grace.

The old soldiers have their own gardens near at hand, and as we stroll there we shall pass College Fields, perpetuating the name of King James's College, and so on between double rows of lime-trees, gnarled and bent, under which the veterans flirt sedately with the demure nursemaids, whose neglected charges meanwhile play with the sheep. Through the gate we enter their small but well-arranged domain, divided into tiny squares, each tilled by its owner, who grows flowers

SANDFORD MANOR HOUSE.

and eat much plum-pudding at dinner that day. Open towards the river, this quadrangle looks out on gracious gardens; just beyond is the great cross, put up for their comrades in the Sepoy mutiny; "some died in battle, some of wounds, some of disease, *all* in the devoted performance of Duty." A little farther out stands the obelisk commemorating those who fell on that dark and doubtful day at Chillianwallah, January 13, 1849. As we stand here, beside a quiet Quaker cannon, these memorials to the devoted dead in front, the terraced gardens slope to the river beyond, their "carpet-beds" yellow with autumnal flowers; the graceful towers and swaying chains of Chelsea Suspension Bridge rise on the left; over the drooping limes and elms of the embankment the slim spars of lazy sloops slip slowly by; the gleaming river glides beneath, and over beyond it the feathery masses of the trees of Battersea Park stand solidly against the sky. The mellow autumn sun floods the scene, and

or vegetables, as may suit him, and gains a little more tobacco-money by his sales. They seem fond of the flowers which put themselves most in evidence, and their little gardens are all aglow with gorgeous hollyhocks, dahlias, sunflowers, of the most gigantic and highly colored kinds. You will be pleased, I hope, to learn that this little piece of ground is called Ranelagh Gardens, and is the sole surviving remnant of that famous resort so dear to an older generation. Lord Ranelagh was one of the three commissioners appointed in the beginning to manage the new hospital, and so he leases to himself seven acres of its grounds on the east, lying along the river, and there builds a grand mansion in 1691, the gardens of which are "curiously kept and elegantly designed, so esteemed the best in England." This first Earl of Ranelagh has been one of the pupils of a certain school-master named John Milton, probably at his house in Barbican in the city, so recently torn down. The earl becomes

a famous man, in a different line from his school-teacher, and dying in 1712 leaves Ranelagh House and gardens to his son, who sold the place in 1733 to Lacy, Garrick's partner in the Drury Lane theater patent, to be made by him a place of open-air amusement, after the manner of the favorite Vauxhall; but "it quite eclipses Vauxhall," writes Horace Walpole. Of course he has his sneer at the "rival mobs" of the two places; but he did not disdain to show himself a very swell mob's man, in his famous carouse at Ranelagh with Miss Ashe and Lady Caroline Petersham. The manners and morals of this place and this time have never been so pithily presented as in George Selwyn's *not*, on hearing that one of the waiters had been convicted of robbery: "What a horrid idea he'll give of us to those fellows in Newgate!"

At this distance, however, the fêtes, frolics, fireworks, and all the fashionable frivolity of the place, look bright and attractive. Nor did grave and reverend men disdain to spend their evenings in the gardens, "to give expansion and gay sensation to the mind," as staid old Dr. Johnson asserted it did! Goldsmith found it so, when he came here to forget the misery of his lodging in Green Arbor Court, where now stands the Holborn Viaduct Station. Laurence Sterne, fresh from his Yorkshire parsonage, finding himself the fashion in town, and plunging into all its gayeties, came to Ranelagh more often than was considered seemly. Smollett sometimes emerged from out his Chelsea solitude for a sight of this festive world; and Fielding came here to study the scenes for his "Amelia"; and Addison, who chats about the place in his "Spectator." It is spoken of in the "Connoisseur" and the "Citizen of the World," the poet Bloomfield introduces it, and Fanny Burney places here a scene in her "Evelina." She was then — just one hundred years ago — a little past twenty-six, living with her father, Dr. Burney, recently made organist of the hospital chapel, next door. Ranelagh had then begun to "decline and fall off," in Silas Wegg's immortal phrase. Having been open since 1742, it finally closed at the beginning of this century, its artificial moon paling before the rising radiance of the new Cremorne.

On an old tracing of the hospital boundaries in its archives, I read: "To answer the Earl of Ranelagh's house on the east side of the college, an house was builded in the Earl of Orford's garden on the west side." This was the house into which Sir Robert Walpole moved

from his lodgings near by, where now Walpole street runs: the same lodgings in which the Earl of Sandwich had lived long before — the Edward Montague who, as commander of the fleet, brought Charles II. back to England, was made Earl of Sandwich for this service, and in 1663 he came to live in Chelsea, "to take the ayre."

Crossing through court and quadrangle and gardens to the western side of the hospital, we are allowed to enter the infirmary, and pass into Ward No. 7. Here we stand in Sir Robert Walpole's dining-room, unchanged since he left it, except that the array of fine Italian pictures has gone from the walls, and that decrepit soldiers lie about on cots, coughing and drinking gruel from mugs. But for all this, perhaps by reason of all this, this room, with its heavily molded ceiling, its stately marble mantel — all in severe white — is one of the most impressive relics of by-gone grandeur in all London. The house, grand in its day, grand still, was built by Sir John Vanbrugh, whose architecture — florid and faulty, but with a dignity of its own — was as heavy as his comedies were light, and brought on him Swift's epitaph:

"Lie heavy on him, earth, for he
Hath laid many a heavy load on thee."

The old red-brick mansion has been raised a story, but otherwise stands almost as when Walpole lived here, from 1723 to 1746, and from its chambers ruled England through his subjects George I. and George II., whom he allowed to reign. Here came Bolingbroke on his return from his exile in France, to dine at the invitation of his great rival, whom he hated and envied. It was not a festive dinner for him, and Horace Walpole tells us that "the first morsel he put into his mouth was near choking him, and he was reduced to rise from the table and leave the room for some minutes. I never heard of their meeting more." Here Swift used to stride in to dinner, studying his host for the rôle of Flimnap, in his "Gulliver," which he was then writing. Here Gay, then secretary or steward to Lady Montmouth, a little farther on in Chelsea, swaggered in his fine clothes, and, being snubbed by his cynical host, put him on the stage as Macheath in his "Beggar's Opera." Pope used to drive over in his little trap from Twickenham, before his friend Bolingbroke's return, and entertain Sir Robert with the details of his row about Lady Mary Wortley Montague with that be-rouged fop, Lord Hervey.

THE FATE OF A VOICE.

BY MARY HALLOCK FOOTE,

Author of "The Led-Horse Claim," "John Bodewin's Testimony," etc.

HERE are many loose pages of the earth's history scattered through the unpeopled regions of the Far West, known but to few persons, and these unskilled in the reading of Nature's dumb records.

One of these unread pages, written over with prehistoric inscriptions, is the cañon of the Wallula River.

An ancient lava stream once submerged the valley. Its hardening crust, bursting asunder in places, left great crooked rents, through which the subsequent drainage from the mountain slopes found a way down to the desert plains. In one of these furrows, left by the fiery plowshare, a river, now called the Wallula, made its bed. Hurling itself from side to side, scouring out its straitened boundaries with tons of sand torn from the mountains, it slowly widened and deepened, and wore its ancient channel into the cañon as it may now be seen.

No one knows how long the river has been making the bed in which it lies so restlessly. Riding towards it across the sunburnt mountain pastures, its course may be traced by the black crests of the lava bluffs which line its channel, showing in the partings of the hills. From a distance the bluffs do not look formidable; they seem but a step down from the high sunlit slopes, an insignificant break in the skyward sweep of their long, buoyant lines. But ride on to the brink and look down. The bunch-grass grows to the very edge, its slight spears quivering in light against the cañon's depths of shadow. The roar of the river comes up to your ears in a continuous volume of sound, loud and low, as the wind changes. Here and there, where the speed of the river has been checked, it has left a bit of white sand beach, the only positive white in the landscape. The faded grasses of the hills look pale against the sky; it is a country of cloudless skies and long rainless summers—only the dark cañon walls dominate the intensity of its deep, unchanging blue. The broad light rests, still as in a picture, on the fixed black lines of the bluffs, on the slopes of wild pasture whose curves flatten and crowd together as they meet the horizon. A few black dots of cattle, grazing in the dis-

tance, may appear and then stray out of sight over a ridge, or a broad-winged bird may slowly mount and wheel and sink between the cañon walls. Meanwhile, your horse is picking his way, step by step, along the bluffs, cropping the tufts of dry bunch-grass, his hoofs clinking now and then on a bit of sunken rock, which, from the sound, might go down to the foundations of the hills; there are cracks, too, which look as if they went as deep. The basalt walls are reared in tiers of columns with hexagonal cleavage. A column or a group of columns becomes dislocated from the mass, rests so, slightly apart; a girl's weight might throw it over. At length the accumulation of slight, incessant propelling causes overcomes its delicate poise; it topples down; the jointed columns fall apart, and their fragments go to increase the heap of débris which has found its angle of repose at the foot of the cliff. A raw spot of color shows on the weather-worn face of the cliff, and beneath a shelf is left, or a niche, which the tough sage and the scented wild syringa creep down to and fearlessly occupy in company with straggling tufts of bunch-grass.

One summer a party of railroad engineers made their camp in the river cañon, along the side of a gulch lined with willows and wild roses, up the first hill above it, and down on the white sand beach below. There were the quarters of the division engineer, who had ladies with him in camp that summer; the tents of the younger members of the corps, the cook-tent, and the dining-shed were on the hill, and the camp of the "force" was lower down the gulch. Work on that division of the new railroad was temporarily suspended; the engineer in charge, having finished his part of the line to its junction with the valley division, was awaiting orders from his chief.

It was September, and the last week of the ladies' sojourn in camp. They were but two, the division engineer's wife and the wife's younger sister, a girl with a voice. No one who knew her ever thought of Madeline Hendric without thinking of her voice, a fact she herself would have been the last to resent. At that time she was ordering her life solely with reference to the demands of that imperious organ. An obstinate huskiness that had changed it since the damp, late Eastern spring, and veiled its brilliancy, was the mo-

tive which had sent her, with her sister, to the dry, pure air of the foot-hills. In the autumn she would go abroad for two or three years' final study.

It was Sunday afternoon in camp. Since work on the line had ceased there was little to distinguish it from any other afternoon, except that the little Duncan girls wore white dresses and broad ribbons at lunch instead of their play frocks, and were allowed to come to the six o'clock dinner in the cook-tent. Mrs. Duncan had remarked to her husband that Madeline and young Aldis seemed to be making the most of their farewells. They had spent the entire afternoon together on the river beach, not in sight of the camp, but in a little cove secluded by willows, where the brook came down. Mrs. Duncan could see them now returning with lagging steps along the shore, not looking at each other and not speaking, apparently. The rest of the camp was on its way to dinner.

"I told you how it would be, if you brought her out here, you know," Mr. Duncan said, waiting for his wife to pass him, with her skirts gathered in one hand, along the foot-bridge that crossed the brook to the cook-tent.

"Oh, Madeline is all right," she replied.

But Aldis was missing at table, and Madeline came down late, though without having changed her dress, and during dinner avoided her sister's eye.

"You're not going out with him again, Madeline!" Mrs. Duncan found a chance to say to the girl after dinner, as she was hurrying up the trail with a light shawl on her arm. "*All* the afternoon, and now again! What can you be thinking of?"

Mrs. Duncan could see Aldis walking about in front of the tents on the hill, evidently on the watch for Madeline.

"I must," she said hurriedly. "It is a promise."

"Oh, if it has come to *that* —"

"It hasn't come to anything. You need not be troubled. To-night will be the last of it."

"Madeline, you must not go. Let me excuse you to Aldis. I can't let you go till I've had a chance to talk with you."

"That is what I have promised *him* — one more chance. You cannot help us, Sallie. Go back, dear, and don't worry about me."

These words were hastily whispered on the trail, Aldis walking about and gloomily awaiting the result of this flying conference between the sisters. Mrs. Duncan went back to the house only half-satisfied that she had done her duty. It was not the first time she had found it difficult to do her duty by Madeline, when it happened to conflict with the inclinations of that imperative youngest

daughter of the house of Hendric. Besides, it was not for Madeline she was troubled.

The path leading to the bluffs was one of the many cattle-trails that wind upward with an even grade from base to summit of every grass-covered hill on the mountain ranges. Madeline and Aldis shortened the way by leaving the trail and climbing the side of the bluff where it jutted out above the river. It was a steep and breathless struggle upward, and Madeline did not refuse the accustomed help of her companion's hand, offered in silence with a look which she ignored. Mechanically they sought the place where it had been their custom to sit on other evenings of the summer they had spent together,—one of those ledges a few feet from the summit of the bluff where part of a row of columns had fallen. Cautiously they stepped down to it along a crevice slippery with dried grasses, he keeping always between her and the brink.

The sun had already set to the camp, but from their present height they could see it once more, drifting down the flaming west. Suddenly, as a fire-ship burns to the water's edge and sinks, the darkening line of the distant plains closed above that intolerable splendor. All the cool subdued tones of the cañon sprang into life; the river took a steely gleam. Up through the gate of the cañon rolled the tide of hazy glory from the valley, touched the topmost crags, and mounted thence to fade in the evening sky. The two on the bluffs still sat in silence, their faces pale in the deepening glow, but Madeline had crept forward on the ledge, nearer to Aldis, to look down. It was the first confiding natural movement she had made towards him since the shock of this new phase of their friendship had startled her. Aldis was grateful for it, while resolved to take all possible advantage of it. At his first words she drew back, and he knew, before her answer came, that she had instantly resumed the defensive.

"Everything has been said, except things it would be unkind to say. Why need we go over it all again?"

"That is what we came up here for, isn't it? To go over it all once more, and get down to the very dregs of your argument."

"It isn't an argument. It's a decision, and it is made. There is nothing more I can say, except to indulge in the meanness of recrimination."

"Go on and recriminate, by all means! That is what I want,—to make you say everything you have on your mind. Then I want you to listen to me. What is it you are keeping back?"

"Well, then, was it quite honest of you to seem to accept the conditions of our — being

together this summer, as we have been, and all the while to be nursing this — hope, — for me to have to kill? Do you think I like to?"

"The conditions?" he repeated. "What conditions do you mean? I knew you intended yourself for a public singer."

The girl blushed hotly. "Why do you say 'intended myself'? I did not choose my fate. It has chosen me. You must have known that marrying" — the word came with a kind of awkward violence from her lips — "anybody was the last thing I should be likely to think of. A voice is a vocation in itself."

"I did not propose marriage to you as a vocation. As for that hope you accuse me of secretly harboring, I have never held you responsible for it. I took all the risks deliberately when I gave myself up to being happy with you and trying to make you happy with me. You have been happy sometimes, haven't you?"

"Yes," she confessed; "too happy, if this is the way it is to end."

"But it isn't? Perhaps I ought to thank you for being sorry for me, but that isn't what I want. I want to make you sorry for yourself and for the awful mistake you are making."

"Oh, the whole summer has been a mistake! And this place and everything have been fatal! But if you had only been honest with me, it would all have been different. I should have been on my guard."

"Thank Heaven you were not! Do you suppose the man lives who would put a girl on her guard, as you say, and endure her company on such terms?"

"You know what I mean. I am not free; I am not — eligible. I thought you understood that and admitted it. We were friends on that basis."

"I never admitted anything of the kind, or accepted any basis but the natural one. When you make your own conditions for a man and assume that he accepts them, you should ask yourself what sort of an animal he is. Most of us believe we have an inalienable right to try to win the woman we have chosen, if she is not bespoken or married to another man."

"I am bespoken then. Thank you for the word. My life is pledged to a purpose as serious as marriage itself. You need not smile. Love is not the only inspiration a woman's life can know. I shall reach far more people through my art than I could by just living for my own preferences."

"You still have preferences, then?"

"Why should I deny it? I don't call it being strong to be merely indifferent. I can care for things and yet give them up. I don't expect to have a very good time these next three years. I dare say I shall have foolish dreams like other girls, and look back and count

the time spent. But what I truly believe I was meant to do, that I will do, no matter what it costs. There is no other way to live. Listen!" — she stopped him with a gesture as he was about to speak. She raised her head. Her gray eyes, which had more light than color in them, were shining with something that looked like tears, as she gave voice to one long, heart-satisfying peal of harmony, prolonging it, filling the silence with its rich cadences, and waking from the rocks across the cañon a faint eerie repetition, an echo like the utterance of a voice imprisoned in the cliff. "There," she said, "are the two me's, the real me and what you would make of me — the ghost of a voice — an echo of other voices from the world I belonged to once, calling in the wild places where you would have me buried alive."

He smiled drearily at this girlish hyperbole. "I think there is room here even for a voice like yours. It need not perish for want of breath."

"No, but for want of listeners. I could not sing in an empty world."

"You would have one listener. I could listen for ten thousand."

"Oh, but I don't want you. I want the ten thousand. There are plenty of women with sweet voices meant for only one listener. You ought to find one of those voices and listen to it the rest of your life." There was a tremulous, insistent gayety in her manner which met with no response. "As for me," she continued, "I want to sing to multitudes. I want to lean my voice on the waves of great orchestras. I want to feel myself going crazy in the choruses, and then sing all alone in a hush. Oh, don't you know that intoxicating silence? It takes hundreds to make it. And can't you hear the first low notes, and feel the shudder of joy? I can. I can hear my own voice like a separate living thing. I love it better than I love myself! It isn't myself. I feel sometimes that it is a spirit that has trusted itself to my keeping. I will not betray it, even for you."

This little concession to the weakness of human preference escaped her in the ardor of her resolve. It was not lost upon Aldis.

"Do you think I wish to silence you?" he protested. "I love your voice, but not as a separate thing. If it is a spirit, it is your spirit. But I could dispense with it easily!"

"Of course you could. You don't care for me as I am. You have never admitted that I have a gift which is a destiny in itself. If you did, you would respect it; you could not think of me, mutilated, as I should be, if you took away my one means of expression."

"Oh, nobody who has anything to express is so limited as that. Besides, I wouldn't take

it away. I would enlarge it, not force it into one channel. I would have the woman possess the voice, not the voice possess the woman. I should be the last to deny that you have a destiny; but I have one too. My destiny is to love you and to make you my wife. There is nothing in that that need conflict with yours."

"I should think there was everything!"

"You have never let me get so far as a single detail, but if you will listen."

"I thought I had listened pretty well for one who assumes it is her mission to be heard," Madeline said again, with a piteous attempt at lightness, which her hot cheeks and anxious eyes belied.

"Granting that it is your mission, this part of the world is not so empty as it looks. The people who would make your audiences here are farther apart than in the cities, but they have the enthusiasm that makes nothing of distance. They would make pilgrimages to hear you — whole families in plains-wagons with the children packed in bed-quilts. And the cowboys! they would gather as they do to a grand round-up. It would be a unique career for a singer," he continued, ignoring an interruption from Madeline, asking who would involve this wide-spread enthusiasm, and would he have her advertised in the "Wallula News Miner."

"There would be no money in it for us" (Madeline winced at the pronoun); "I would not have your lovely gift peddled about the country. There would be no floral tributes or press notices you would care for, or interviews with reporters or descriptions of your dresses in the papers. You might never have the pleasure of seeing your picture in the back of the monthlies, advertising superior toilet articles; but to a generous woman who believes in the regenerating influence of her art, I should think there would be a singular pleasure in giving it away to those who are cut off from all such joys. I know there are singers who boast of their five-thousand-dollar-a-night voices; I would rather boast that mine was the one free voice that could not be bought."

"There are no such vagrant, prodigal voices. A beautiful, trained voice is one of the highest products of civilization; it takes the most civilized listeners to appreciate it. It needs the stimulus of refined appreciation. It needs the inspiration of other voices and the spur of intelligent criticism. I know you have been making fun of my ambitions, but I choose to take you seriously. My standard would come down to the level of my audiences — the cowboys and the children in bed-quilts."

"Oh, no, it wouldn't. Your genius is its own standard, is it not? You would be like

the early poets and the troubadours. They sang in rather an empty world, did they not, and not always to critical audiences? The knights and barons couldn't have been much above our cowboys."

"Oh, how absurd you are! No, not absurd, but unkind; you are making desperate fun of me and of my voice too, because I make so much of it — but you force me to. It is my whole argument."

"I'm desperate enough for anything, but I'm hardly in a position to make fun of any rival. Madeline, sometimes I hate your voice, and yet I love it too. I understand its power better than you think. It has just the dramatic quality which should make you the singer of a new people. Oh, how blind you are to a career so much finer, so much broader, so much sweeter, and more womanly! Your mission is here, in the camps of the Philistines. You are to bring a message to the heathen; to sing to the wandering, godless peoples, — to the Esaus and the Ishmaels of the Far West."

"That is all very fine, but you know perfectly well that your Esaus and your Ishmaels would prefer a good clog-dancer to all the 'messages' in the world."

"Oh, you don't know them, — and if they did, it would be the first part of your mission to teach them a higher sort of pleasure."

"And I am to go to Munich and study for the sake of coming out here to regenerate the cowboys?"

"That isn't the part of your destiny I insist upon," Aldis said, letting the weariness of discouragement show in his tones. "But you say you must have an audience. And I must have you —"

"But does it occur to you," Madeline interrupted quickly, "what a tremendous waste of effort and elaboration there would be between the means and the effect?"

"I don't ask for the effort and the elaboration. That is the part *you* insist upon. All I want is you, just as you are, voice or no voice. You need not go to Munich on my account."

"You expect me to give up everything."

"You would have to give up a good deal; I don't deny it. But is there any virtue in woman that becomes her better?"

"Perhaps not, from a man's point of view. But it is no use listening to you. You haven't the faintest conception of what my future is to me, as I see it, and all this you have been talking is either a burlesque on my ambition, or else it is the insanity of selfishness — masculine selfishness. I don't mean anything personal. You want to absorb into your own life a thing that was meant to have a life of its own, for all the world to share and enjoy. Yes, why not? I won't pretend to depreciate

my gift! I am only the tenement in which a precious thing is lodged. You would drive out the divine tenant, or imprison it, for the sake of possessing the poor house it lives in."

"Good Heavens!" Aldis exclaimed, with a sort of awe of what seemed to him an almost blasphemous absurdity. "What nonsense you young geniuses can talk! I wish the precious tenant would evacuate and leave you to your sober senses, and to me."

"And this is what a man calls love!"

Aldis laughed fiercely. "Has there been any new kind of love invented lately? This is the kind that came into the world before art did."

"Art is love, without its selfishness," said Madeline, with innocent conclusiveness.

"Where the deuce do you girls learn this sort of talk?" Aldis demanded of the girl beside him.

She answered him with unexpected gentleness. She leaned towards him, and looked entreatingly in his face. "This is our last evening together. Don't let us spoil it with this wretched squabbling."

"She calls it squabbling—a man's fight for his life!" He turned and gave her back her look, with more fire than entreaty in his eyes.

"There is the moon," she said hurriedly. "It is time to go home."

The fringe of grasses above their heads was touched with silver light, and the shadow of the bluff lay broad and distinct across the valley.

"We must go home," Madeline urged. Aldis did not move.

"Madeline, would you marry me if I had a lot of money?"

"Oh, hush!"

"No, but would you? Answer me."

"Yes, I would." She was tired of choosing her words. "For then you would not have to earn a living in these wild places."

"You would take me then as a sort of appendage? You don't want a man with work of his own to do?"

"Not if it interferes with mine."

"That is your answer?"

"Can I make it any plainer?"

"You have not said you do not love me."

"I don't need to say it. It is proved by what I do—I might have been nicer to you, perhaps, but you are so unreasonable."

"Never mind if I am. Be nice to me now!"

"I meant to be. But it is too late. We must go home." She felt that she was losing command of herself through sheer exhaustion; it could only mislead him and prolong the struggle if she should now betray any signs of weakness. "Come," she said, "you will have to get up first."

He did not move.

"Oh, sit still a little longer," he pleaded. "I will not bother you any more. Let us have one half hour of our old times together—only a little better, because it is the last."

"No, not another minute." She rose quickly to her feet, tripped in her skirt, and tottered forward. Aldis had risen too. As she reeled and threw out her hands, he sprang between her and the brink, thrusting her back with the whole force of his sudden spring. The rock upon which he had leaped, regardless of his footing, gave its final quake and dropped into the abyss. It was the uppermost segment of a loosened column. The whole mass went down, narrowing the ledge so that Madeline, by turning her head, could look into the depths below. She did not move or cry; she lay still, but for the deep gasping breaths that would not cease, though all the life had seemed to go out from her when he went down. The relief of unconsciousness did not come to her. She was aware of the soft, dry night wind growing cool, of the river's sighing, of the long grasses fluttering wildly against the moon above her head. The perfume of wild syringa blossoms, hidden in some crevice of the rock, came to her with the breeze. There were crackling, rustling noises from the depth of shadow into which she dared not look; then silence, except the wind and the river's roar, borne strongly upwards, as it freshened—. And all the words they had said to each other in their long, passionate argument kept repeating themselves, forcing themselves upon her stunned, passive consciousness, she lying there, not caring if she never stirred again, and he on the rocks below—and between them the sudden, awful silence. She might have crept to the brink and called, but she could not call to the dead.

Gradually it came to her that she must get herself back somehow to the camp with her miserable story. It would be easier, it seemed, to turn once over and drop off the cliff, and let some one else tell the story for them both. But the fascination of this impulse could not prevail over the awakening shuddering fact of her physical being. She despised herself for the caution with which she crept along the ledge and up the grass-grown crevice. If he had been cautious she would be where he was lying now. It was her own rash girl's fancy for getting on the brink of things and looking over that had brought them first to that fatal place. But these thoughts were but pin-pricks following the shock of that benumbing horror she was carrying with her back to the camp.

As she looked down upon its lights she felt

like one already long estranged from the life she had been the gay center of but two hours before. She knew how her sister's little girls were asleep, the night wind softly stirring the leaves outside their bedroom window; how still the house was; how empty and white in the moonlight the tents on the hill; how the camp was assembled on the beach, waiting for her return with Aldis and for the evening singing. Sing! She could have shrieked, sobbed, and cried aloud at the thought of this home-coming—she alone with the burden of her sorrow, and by and by Aldis, borne in his comrades' arms and laid on his bed in that empty tent on the hill.

But there was a hard constriction, a dumb, convulsive ache in her throat. She felt as if no sound could ever be uttered by her again.

IF Aldis had been lying dead at the foot of the bluffs, as Madeline believed, this story would never have been told in print, except in a cold-blooded newspaper paragraph which would have omitted to mention one curious fact connected with the accident, that a young girl who was the companion of the unfortunate young man, when it occurred, suffered a shock of the nerves from the sight of his fall that deprived her entirely of her voice, so that she could not speak except in whispers.

It was not Aldis who was the victim of this tragedy of the bluffs, but Aldis's successful rival, the voice. It was hushed at the very moment of its triumph. A blow from the brain upon those nerve-chords which were its life! Love shook the house in which music dwelt, jarred it to its center, and the imperious but frail tenant had fled.

At the moment when Madeline's tortured fancy was bringing home a mangled heap and laying him in the last of that row of tents on the hill, Aldis was getting himself home, by the lower trail, as fast as his bruises would let him.

He had fallen into a scrubby growth of wild syringa that flung its wax-white blossoms out from a cranny in the cliff less than half-way down. As he crashed into it, its tough and springy mass checked his fall enough to enable him to get a firm grasp with his hands. He hung dangling at arm's length against the cliff, groping for a temporary lodgment for his feet. In the darkness he dimly perceived something like a ledge, not too far below him, towards which the face of the bluff sloped slightly outwards.

Flattening himself against the rock he let go his hold and slid, clutching and grinding downward till his feet struck the ledge. From this vantage, after getting his breath and

taking a deliberate view of his situation, it was not a difficult feat to reach the slope of broken rock below. He sat there while the trembling in his strained muscles subsided, scarcely conscious as yet of his torn and scratched and bruised condition. He was about to raise his voice in a shout to assure Madeline of his safety when the thought turned him sick, that, unnerved as she must be with the sight of his fall, she might mistake the call for a cry for help, and venture too near that treacherous edge to look down. He kept still, while the horror grew upon him of what might happen to Madeline alone on the ledge or trying to climb the slippery crevice in the shadow of the bluff. He knew that a mass of rock had fallen when he fell; was there space enough left on the ledge by which she could safely reach the crevice? He could not resist giving one low call, speaking her name as distinctly and quietly as he could, and bidding her not move but listen. There was no answer; the roar of the rapids, borne on the wind that nightly drew down the cañon, drowned his voice. Madeline did not hear him. He waited until the silence convinced him that she was no longer there; then he took his way toilsomely back to the camp.

A light showed in the window of the office, which in the evening was usually dark. He found the family assembled there in the light of a single kerosene lamp, the flame of which was streaming up the chimney unobserved, while all eyes were bent upon Madeline, seated in one of the revolving office chairs, with her back to the desk. She leaned shivering and whispering towards her sister, who knelt on the floor before her, holding her hands and staring, with a fearful interest, into the girl's colorless face.

The men who stood nearest the door turned and started as Aldis entered.

"Why, good God, Aldis!" Mr. Duncan exclaimed. "Why, man, we thought you were dead—you don't mean to say it's you—all of you?"

"I'm all here," said Aldis.

"He's all here, Madeline," Mrs. Duncan shouted hysterically to the girl, as if she were deaf as well as dumb.

THE fateful voice was undoubtedly gone. Madeline could no longer plead ineligibility when the common destiny of woman was offered her. But if Aldis had thought to profit immediately by her release from the claims of art he was disappointed.

What was the new obstacle? Only some more of Madeline's high-flown nonsense, as her sister called it. She was always making a heroic situation out of everything that hap-

pened to her, and expecting her friends to bear her out in it.

She had been put to bed the night of the adventure on the cliff shaking with a nervous chill. Next day's packing had been suspended, and the eastward journey postponed. But in a day or two she was sufficiently recovered to be walking again with Aldis on the shore, and the old argument was resumed on a new basis. Madeline, pale and wistful, with Aldis's head very close to her's, that the river's intruding roar might not drown her whispers, protesting — sometimes with sobs, sometimes with sudden, tremulous laughter that shook her with dumb convulsions hardly more mirthful than the sobs — that she could not and she would not burden his life with the wreck she now passionately proclaimed herself to be.

But would she not give him what he wanted, had wanted, should continue to want and to try for so long as they both should live?

No, he didn't — he couldn't possibly want a ridiculous muttering shadow of a woman beside him all the days of his life. It was only his magnanimity. She wondered he could believe her capable of the meanness of taking advantage of it.

Aldis did not despair, but it was certainly difficult, with happiness almost within his reach, with the girl herself sometimes sobbing in his arms, to be obliged to treat this obstacle as seriously as Madeline insisted it should be treated. He appealed to Mrs. Duncan, who scolded and laughed at her sister alternately, and quoted with elaborate particulars a surprising number of similar cases of voices lost and found again by means of care and skillful treatment. But hers was *not* a similar case, Madeline vehemently declared. It was *not* from a cold, like Mrs. So and So's; it had not come on gradually, beginning with a hoarseness, like some one's else. It was; the girl believed in her heart that she had been made a singular and impressive example of the folly and wickedness of pride in an exceptional gift, and triumph in its corresponding destiny. The spirit she had boasted of harboring had deserted her. She deserved her punishment, but she would not permit another's life to be shadowed by it, especially one so generous — who, so far from resenting her refusal of the whole loaf, was content, or pretended to be, with the broken and rejected fragments. But all this Madeline was careful to keep from the cheerful irreverence of her sister's comments. She faltered something like it to Aldis in one of their long talks by the river; his low tones answering briefly, and at long intervals, her piercing whispers that sometimes almost shrieked her trouble in his ear. He could feel that she was still thrilling with

the double shock she had suffered; he was infinitely tender with her, and patient with her extravagant expositions of the situation between them. He longed to heap savage ridicule upon them, but he forbore. He listened and waited and let her talk until she was worn out, and then they were happiest together. For a few moments each day it seemed that she might drift back to him on the ebb of that overstrained tide of resistance and be at rest.

Madeline was always impatient of any discussion of the chances of her recovery, but one day, just before the time of their parting, Aldis surprised and captured an admission from her that there might be such a chance. Would she, then, on the strength of that possibility, consent to be engaged to him and treat him as her accepted lover, since nothing but her pride now kept them apart?

"Pride," Madeline repeated; "I don't know what I have left to be proud of."

"There is a kind of stiff-necked humility that is worse than pride," said Aldis, smiling at the easy way in which she shirked the logic of the conclusion he was forcing upon her. "You won't consent to the meanness, as you call it, of giving me what you are pleased to consider a damaged article, a thing with a flaw in it; as if a woman would be more lovable if she could be warranted proof against all wear and tear. But if the flaw can be healed, if there is a possibility that the voice may come back, why should we not be engaged on that hope?"

"And if it never does, will you promise to let me release you?"

"You can release me any time — now, if you like."

"But will you promise to take your release when I give it to you?"

"We will see about that. Perhaps by the time your voice doesn't come back I shall have been able to make you believe that it isn't the voice I care for."

"And if it should come back," cried Madeline with sudden enthusiasm, "I shall have my triumph! I am done forever with all that nonsense about Art and Destiny. If my voice ever should come back, I shall not let it bully me. It shall not decide my fate. You will see. Oh, how I wish you *might* see! I have learned my lesson in the true, awful values of things. Thank Heaven it has cost no more! There is one less singer in the world, perhaps, but there is not one less life. Your life. If you had lost it that night, and I had kept my voice, do you think I should ever have had any joy in it again — even lifted it up, as I boasted to you I would some day, before crowds of listeners? Could I have gone before the footlights, bowing and smiling,

with my arms full of flowers, and remembered your face and your last look as you went down?"

"Then it is settled at last, voice or no voice?"

"Yes,— but I am so sorry for you! It will not come back; I know it never will, and I shall go on whispering and gibbering to the end of my days, and all your friends will pity you; it is such a painfully conspicuous thing!"

"I want to be pitied. I am just pining to be an object of general compassion. Only I want to choose what I shall be pitied for."

"Choose?" said Madeline stupidly. "What do you mean?"

"I *have* chosen. Now be as sorry for me as you like. And we'll ask for the sympathy of the camp to-night. It will be a blow to the boys — my throwing myself away like this!"

"How ridiculous you are!" sighed Madeline. It was a luxury, after all, to yield. And perhaps in the depths of her consciousness, bruised and quivering as it was, there lingered a faint image of herself, as a charming girl sees herself reflected in those flattering mirrors, the eyes of friends, kindred, and adorers. Voiceless, futureless, spoiled as was the budding prima donna, the girl remained: eighteen years old and fair to look upon, with perfect health, and all the mysterious, fitful but unquenchable joy of youth thrilling through her pulses. Perhaps she was not so sorry for Aldis after all, in the innocent joy of her own intentions towards him. The sobs, the frantic whispers died away, and were hushed in a blissful acquiescence. She was not less fascinating to her lover — half amazed at his own sudden triumph — in her blushing, starry-eyed silences, than she had been in all the eager redundancy of her lost utterance. That was a wonderful last day for the young man to dream over in the long months before they should meet again!

THE camp had moved out of the cañon and down upon the desert plains. It was an open winter; up to the first of January the contractors had been able to keep their men at work, following closely the locating party.

Aldis rode up and down the line, putting in fresh stakes for the contractors, keeping them true to the line, and watching incidentally that they did not pod their embankments with sage-brush. His summer camp-dress of broad-shouldered, breezy, flannel shirt, and slender-waisted trousers, was changed to a reefing-jacket, double-buttoned to the chin, long boots, and helmet-shaped cap, pulled low down to keep the wind out of his eyes. Strong wintry reds and browns replaced, on his thin cheek, the summer's pallor.

Madeline Hendric, dressing for dinner at the Sutherland in New York, where she and her sister were spending the winter, would stand before her toilet-glass fastening her laces, her eyes fixed alternately on her own reflection in the mirror and on a dim photograph that leaned against the frame. It was not a bad specimen of amateur photography; it represented a young man on horseback in a wide and windy country, with an expression of sadness and determination in the dark eyes that looked steadfastly out of the gray, toneless picture.

They were the most beautiful eyes in the world, Madeline thought to herself, and sinking on her knees before the low table, with her arms crossed on the lace, rose-lined cover, she would brood in a fond, luxurious melancholy over the picture — over the somber line of plain and distant mountain, and the chilly little cluster of tents huddled close together by the river's dark, swift flood, flowing between icy beaches, below barren shores where a few leafless willows shivered, and the wild-twisted clumps of sage defied the cold.

A moment later she would be rustling softly down the corridor at her sister's side, passing groups of ladies who looked after them with that comprehensive but impersonal scrutiny which is a woman's recognition of anything unusual in another's dress or appearance. Mrs. Duncan looked her sister over with a quick, intelligent side glance, for those silent eye comments were all turned upon Madeline. She could see nothing amiss with the girl; she was looking very lovely, a trifle absent; Madeline had a way lately of looking as if she were alone with her own thoughts, on occasions when other women's faces took on habitually a neutral and impassive expression. It made her conspicuous, as if hers were the only sensitive human countenance exposed in a roomful of masks.

"Why do you never wear your light dresses, Madeline?" said Mrs. Duncan, with the intention of rousing the girl from her untimely dream. "You are very effective in black, with your hair, but I should think you would like once in a while to vary the effect."

"Do you suppose I am studying effects for the benefit of these people? I am *saving* my light dresses."

"Saving them! What for?"

"Do you never save up a pretty dress that Will likes, when you are away from him?"

"No, indeed I don't. It would get out of style, and he would see there was something wrong with it, though he might not know what it was. Dresses *won't* keep! Besides — do you think you are never to have any new ones, now you are engaged to an engineer?"

"I shall not need many, if I go West, and a year or two behind won't matter to—*my* engineer!"

"Oh, you poor innocent! You don't know your engineer yet—and you don't know your West, either. And one is always having to pack up and come East at short notice, and I know of nothing more insupportable than finding one's self dumped off an overland train in New York, in the middle of winter, for instance, with a veteran outfit one hasn't had the strength of mind to 'give to the poor,' as Will says. You never know how your clothes look till you have packed them up on one side of the continent and unpacked them on the other. And let me tell you it pays to dress well in camp. Nothing is too good for them, poor things, so long as it's not inappropriate. Do you suppose a man ever forgets how a woman *ought* to look? Wear out your things, my dear, and take the good of them before they get *passé*, and let the future take care of itself."

Madeline was laughing, and the dreamy, soft abstraction had vanished. A stranger might look into her liquid, half-averted eyes, and see no more there than was meant for the passing glance.

Aldis had the promise of a month's leave of absence in March, but soon after the 1st of January the weather turned suddenly cold. The contractors took their men off the work, and the time of Aldis's leave was thus anticipated by two months.

He telegraphed to Mrs. Duncan that he would be in New York by the 15th, allowing for all contingencies.

Madeline's joy over the telegram was increased by one small item of relief, from the necessity of delaying a communication which she dreaded making by letter.

With rest and skillful treatment her voice had come back, as her sister had prophesied, in its full compass and purity. Her musical instructor had urged her to try it once upon an audience, in a not too conspicuous rôle, before she went abroad to study; for Madeline had not yet found courage to confess her apostasy.

The temptation to sing once as she had so often dreamed of singing, with the support of a magnificent orchestra, the longing to know just how much she was resigning in turning her back upon a musical career, were overmastering.

Moreover, her music was the sole dowry with which she could enrich her husband's life. She had a curious, persistent humility about herself, apart from the gift, which she had grown to consider the essential quality of her being. She desired intensely to know

just how much it was in her power to endow her lover with over and above what his generosity, as she insisted upon calling it, demanded. For Madeline did nothing by halves; she could abandon herself to a passion of surrender as completely as she had done to the fire of resistance; and while she was about it, she wished to feel that it was no paltry thing she was giving up. But she was wise enough in her love to feel that possibly Aldis might not be able fully to enter into the joy of her magnificent renunciation. There might be a pang, an uneasiness to him, so far away from her, in the thought that his old enemy was again in the field. So Aldis only knew this much of her recovery, that she could speak once more in her natural voice. She would reserve her triumph, if so it should prove, until his home-coming, when she could lay it at his feet with a joyous humility and such assurances of her love as no letter could convey.

On the 13th of January she was to be the soloist at one of a series of popular concerts to be given that evening, where the character of the music and of the audience was exceedingly good, and the orchestral support all that a singer's heart could desire. On the 15th Aldis would come home.

It was all delightfully dramatic; and Madeline was not yet so in love with obscurity as to be quite indifferent to the scenic element in life.

In his telegram Aldis had allowed for a two days' delay on business at Denver. Arriving at that city, however, he found that, in the absence of one of the principal parties concerned, his business would have to be deferred. He was therefore due in New York on the 13th. He had not telegraphed again to his Eastern friends; it had seemed like making too much of a ceremony of his home-coming. He dropped off the train from the North at the Grand Central depot in the white early dusk of a snowy afternoon, when the quiet up-town streets were echoing to the sound of snow-shovels, and the muffled tinkle of car-bells came at long intervals from the neighboring avenues. He hurried ahead of the long line of passengers, jumped on the rear platform of a crowded car that was just moving off, and in twenty minutes was at his hotel. He tried to master his great but tremulous joy, to dine deliberately, to do his best for his outer man, before presenting himself to Madeline, but his lonely fancy had dwelt so long and with such intensity on this meeting that now he was almost unnerved by the nearness of the reality.

The reality was after all only a neat maid, who said, as he offered his card at the door of Mrs. Duncan's apartment, that the ladies were both out. It was impossible to accept the

statement simply and go away. Were the ladies out for the evening? he asked. Yes, they had gone to a concert or the opera, or something at the Academy of Music. Mrs. Duncan always left word where she was going when she and Miss Madeline both went out, on account of the children. The maid looked at him with intelligent friendliness. She was perfectly aware of the significance of the name on the card she held. She waited while Aldis scribbled a few words on another card which she was to give to Mrs. Duncan when the ladies returned, in case he missed them at the concert. In the street he debated briefly whether to endure a few more hours of waiting, or hasten on to the mixed joy of a meeting in a crowd. Yet such meetings were not always infelicitous. Delicious moments of isolation might come to two in a great assembly, hushed, driven together in a storm of music. There seemed a peculiar fascinating fitness in the situation. Music, that had threatened to part them, should celebrate, like a hireling, their reunion. The violins were in full cry, mingled with the clear, terse notes of a piano, behind the green baize doors, as he passed into the lobby of the Academy. While he waited for the concerto to end, his eyes rested mechanically upon the portraits of prima donnas, whose names were new to him, in smiles and low corsages and wonderful coiffures of the latest fashion; and he said to himself that well it was for those fair dames but not for his lady—his little girl, she was safe among the listeners, unknown, unpublished. *For* her, not *of* her, the loud instruments were speaking, in that vast, hushed, resounding temple of music.

He would see her first, with her rapt face turned towards the stage. He would know her by her cheek, her little ear, and the soft light tangle of curls hiding her temples. She would not be exalted above him in the Olympian circle of the boxes; she would be in the balcony, not in full-dress, but with some marvel of a little bonnet framing the color and light and sweetness of her face. Her cloak would have slipped down from her smooth, silken arms and shoulders. In his restless, waiting dream he could see her with distracting vividness, while the music sank and swelled in endless cadences behind the barriers: her listening attitude, her lifted, half-averted face, her slender, passive hands in her lap, her soft, deep, joyous breathing stirring the fall of lace or ribbons at her throat.

He was prepared to find her very dainty and unapproachably elegant; there had been a hint of such formidable but delightful possibilities in the cut of her simple camp dresses and in the very way she wore them. He

glanced disconsolately at his own modestly dressed person, with which he was so monotonously familiar, and wondered if Madeline would find him "Western."

The concerto was over at last. He passed down the aisle and along the rear wall of the balcony, keeping under the shadow of the first tier of boxes, while he took a survey of the house. It seemed bewilderingly brilliant to Aldis, seeing it, for the first time in three years, in a setting of frontier life; a much more complex emotion to one born to the life around him, and estranged from it, than to him who sees it for the first time as a spectacle in which he has never had a part. It was with rather a heart-sick gaze he searched the rows and rows of laughing women's faces, banked like flowers against the crimson and white and gold of the partitions.

Suddenly the murmur pervading the house sank into an expectant silence—the musicians' chairs were filling up; but only the gray-headed first violins were leaning to their instruments and fingering their music. The leader's music-stand had been moved to one side to make room for the soloist, a young *débütante*, so the whispers around him announced, who was now coming forward, winding her silken train past the musicians' stands, her hand in that of the leader. Now she sank before the hushed crowd, dedicating to it, as it were, herself, her beauty, her song, her whole blissful young presence there.

Aldis crushed the unfolded programme he held in his hand. He did not need to consult it for the name of the fair young candidate. The blood rushed into his face, and then left it deadly white. His heart was pounding with a raging excitement, but he did not move or take his eyes from Madeline's face. She stood, faintly smiling down upon the crowd, folding and unfolding the music in her hands, while the orchestra played the prelude. Then on the deepening silence came the first notes of her voice. Aldis had never imagined anything like the pang of delicious pain it gave him. Its personality pierced his very soul. Every word of the recitative, in the singer's pure enunciation, could be heard. The song was Heine's "Lorelei," with Liszt's music, and the orchestration was worthy of the music.

"I know not what it presages,"—the recitative began,— "This heart with sadness fraught." Aldis took a deep, hard breath. He knew the story that was coming. The rocks, the river, the evening sky, he knew them all. Had she forgotten? Did the great god Music deprive a woman of her memory, her tender womanly compunction, as well as her heart? Was this beautiful creature with eyes alight and soft throat swelling to the notes of

her song merely a voice, after all, celebrating its own triumph and another's allurements and despair? Was the heart that beat under the laces that covered that white bosom merely a subtle machine for setting free those wonderful sounds that floated down to him and seemed to bid him farewell?

Now, in a wild crescendo, with a hurry of chords in the accompaniment, the end has come; the boat and man are lost. Then an interlude, and the pure, pitiless voice again lamenting now, not triumphing—"And this, with her magic singing, the Lorelei hath done—the Lorelei hath done." The song died away and ceased in mournful repetitions, and the audience gave itself up to a transport of applause. It had won—a new singer; and he had lost—only his wife: He stood there, unknown and unheeded, a pitiful minority of one, and accepted his defeat.

The frantic clappings continued. They were demanding an encore; the friendly old fellows in the orchestra were looking back across the stage to welcome the singer's return. They had assisted at the triumph of so many young aspirants and queens of the hour. This one was coming back, flushed and smiling, her face beautiful in its new joy, as she sank down again with her arms full of flowers, gratefully, submissively, before the audience at whose command she was there. The great house was enchanted with her and with its own unexpected enthusiasm. A joyous thrill and murmur, the very breath of that adulation which is dearest to the goddess of the foot-lights, floated up to the intoxicated girl, wrapt in the wonder of her own success. Aldis could bear no more. He made his way out, pursued by the furious clappings, by the silence, by the first thrilling notes of the encore. He walked the streets for hours, then he went to his room, and threw himself, face downward, on his bed. The lace curtains of his window let in a pallid glimmer from the electric lights in the square,—a ghastly fiction of a moon that never waxes nor wanes. The night spent itself, the tardy winter morning crept slowly over the city wrapt in chill sea fog.

Mrs. Duncan woke with a hoarse feverish cold, and wished she had given Aldis's card and message to Madeline the night before. She had kept them from her, sure that the excited girl would lose what was left of her night's sleep in consequence. Now she felt too ill to make the disclosure and face Madeline's alarm. She waited, with cowardly procrastination until the late breakfast was over, and her little girls had been hurried off to school. She and Madeline had drawn their chairs close to the soft coal fire to talk over the concert, Madeline with a heap of morning

papers in her lap, through which she was looking for the musical notices, when Mrs. Duncan gave her Aldis's note. It needed no explanation or comment. It said that he hoped to find them at the Academy of Music, but if he failed to do so, this was to prepare them for an early call; he was coming as early as he could hope to see them,—nine o'clock, he suggested, with insistence that made itself felt even in the careless words of the note. It was now nearly ten o'clock; he had not come. The gray morning turned a sickly yellow, and the streets looked wet and dirty; the papers were tossed into a corner of the sofa where Mrs. Duncan had taken refuge from Madeline's restless wanderings about the room.

A mass of hot-house roses, trophies of the evening's triumph, were displayed on the closed piano, shedding their languid sweetness unheeded, except once when Madeline stopped near them, and exclaimed to her sister:

"Oh, do tell Alice to take those flowers away!" and the next moment seemed to forget they were still there.

The ladies breakfasted and lunched in their own rooms, dining only in the restaurant below. When lunch was announced, Mrs. Duncan rose from her heap of shawls and sofa-cushions and went to the window where Madeline stood gazing out into the yellow mist that hid the square.

"Come, girlie, come out and keep me company. A watched pot never boils, you know."

"Do you *want* any lunch?" Madeline asked incredulously.

Mrs. Duncan did not want any, but she was willing to pretend she did for the sake of interrupting the girl's unhappy watch.

The two women sat down opposite each other in the little dark dining-room, the one window of which looked into a dingy well inclosed by the many-storied walls of the house. The gas was burning, but enough gray daylight mingled with it to give a sickly paleness to the faces it illumined.

There was a letter lying by Madeline's plate.

"When did this come?" she demanded of Alice, the maid.

"They sent it up, miss, with the lunch-tray."

"Oh!" cried Madeline. "It may have been lying there in the office for hours!"

She read a few words of the letter, got up from the table, and left the room. Mrs. Duncan gave her a few moments to herself, and then followed her. She was in the parlor, turning over the heap of papers in a distracted search for something which she could not seem to find.

"Oh, Sallie," she exclaimed, looking up piteously at her sister, "won't you find when

the Boston shore-line train goes out? I think it is two o'clock, and it's after one now."

"Why do you want to know about the Boston trains?"

"Read that letter — I'm going to try to see him before he starts — read the letter!" she repeated, in answer to her sister's amazed expostulatory stare. She ran out of the room while Mrs. Duncan was reading the letter, and in her own chamber tore off her wrapper and began dressing for the street. Mrs. Duncan heard bureau-drawers flying open and hurried footsteps as she read. This was Aldis's letter:

"Wednesday morning.

"DEAR MADELINE: I saw you at the Academy last night when the verdict was given that separates us.

"The destiny I would not believe in has become a reality to me at last. I must stand aside, and let it fulfill itself.

"Last night I accused you of bitter things, you can imagine what, seeing you so, without any forewarning; but I am tolerably sane this morning. I know that nothing of all that maddened me is true, except that I love you and must give you back to your fate that claims you. You were never mine except by default.

"I am going on to Boston this afternoon. I cannot trust myself to see you. I could not bear your compassion or your remorse, and if you were to offer me more than that, God knows what sacrifice I might not be base enough to accept, face to face with you again.

"Good-bye, my dearest, my only one. I think nothing can ever hurt me much after this. But do not grieve over what neither of us could have helped.

"The happiness of one man should not stand in the way of the free exercise of a divine gift like yours, and the memory of our summer in the cañon — of our last days there together, when my soul set itself to the music of those silences between us — that is still mine. Nothing can take that from me. Yours always,

"HUGH ALDIS."

"Madeline, you are not going after him!" Mrs. Duncan protested, looking up from the letter with tears in her eyes, as her sister entered the parlor, in cloak and bonnet.

Madeline heard the protest; she did not see the tears.

"Don't *talk* to me,—help me, Sallie! Can't you see what I have done? Find me that Boston train, won't you? I know there is one in the evening, but he said afternoon. Where *is* it?" she wailed, turning over with trembling hands sheet after sheet of bewildering columns which mocked her with advertisements of musical entertainments, and even with her own name, staring at her in print.

"The *train* goes at two o'clock, but you shall not go racing up there after him, you crazy girl! I'd go myself, only I'm too sick. I'm awfully sorry for him, but he'll come back — they always do — and give you a chance to explain."

"Explain! I'm going to see him for one instant if I can. I've got just twenty minutes, and nothing on earth shall stop me!"

"Alice," Mrs. Duncan called down the passage, as Madeline shut the outer door, "put on your things and go after Miss Madeline, quick — Third Avenue Elevated to the Grand Central; you'll catch her if you hurry before she gets up the steps."

Mistress and maid reached the Grand Central station together, a few minutes before the train moved out. The last of the line of passengers, ticket in hand, were filing past the door-keeper. It needed but a glance to see that Aldis was not among them. It would be safer, Madeline decided quickly, to get out upon the platform in broadside view from the windows of the train. If Aldis were already on the train, or, better still, on the platform, and saw her, Madeline felt sure he would instantly know why she was there.

"I only want to see a friend who is going by the Boston train," she said to the door-keeper. "I'm not going myself." He hesitated, and said something about his orders. "If I must have a ticket, my maid will get me one, but I cannot wait; you must let me through!" She handed her purse to Alice; the man at the gate said he guessed it was no matter about a ticket; he looked curiously after her as she sped along the platform, such a pretty girl, her cheeks red, and her hair all out of crimp with the dampness, but with a sob in her voice, and eyes strained wide with trouble!

"Last train down on the right!" he called after her. "You'll have to hurry." Ominous clouds of steam were puffing out of a smoke-stack far ahead of her; men were swinging themselves aboard from the platform where they had been walking up and down.

"Boston Shore-line, miss?" a porter lounging by his empty truck called to Madeline as she came panting up to the rear car.

"Oh, yes!" she sobbed. "Is it gone?"

The train gave one heavy, clanking lurch forward. The porter laughed, caught her by the arms, and swung her lightly up to the platform of the last car. The brakeman seized her and shunted her in at the door. The train was in motion. She clung wildly to the door-handle a moment, looking back, and then sank into the nearest seat and burst into tears. Curious glances were cast at her from the neighboring seats, but Madeline was oblivious of everything but the grotesque misery of her situation. What would Alice think, and what would poor, frantic Sallie think, what even would the man at the gate think, who had taken her word instead of a ticket! The conductor came round after a while, and Madeline appealed to him. She had been put on the train by mistake. She had no money and no ticket, but there was, she thought, a friend of hers aboard — would the conductor kindly

find out for her if a Mr. Aldis were in any of the forward cars, and tell him a lady, a friend of his, wished to see him?

The conductor had a broad, purple, smooth-shaven cheek, which overflowed his stiff shirt-collar; he stroked the tuft of coarse beard on the end of his chin, as he assured the young lady that she need not distress herself. He would find the gentleman if he were on the train. Was he a young gentleman, for instance?

"Yes, he was young and tall, and had dark eyes——" and suddenly Madeline stopped and blushed furiously, meeting the conductor's small and merry eye fixed upon her in the abandonment of her trouble.

The door banged behind him; the car swayed and leaped on the track as the motion of the train increased. A long interval, then a loud crash of noise from the wheels as the door opened again at the forward end of the car. A gentleman was coming down the aisle, looking from side to side as if in search of some one.

Madeline squeezed herself back into the corner of her seat next the window. The blood dropped out of her hot cheeks and stifled her breathing. She turned away her face, and buried it in her muff as some one stopped at her seat, and said, leaning with one hand on the back of it, "Is this the lady who wished to see me?"

Aldis's face was as white as her own; his hand gripped the seat to hide its shaking. Madeline swept back her skirts, and he took the seat beside her. A long silence; Madeline's cheek and profile emerged from the muff and became visible in rosy silhouette against the blank white mist outside the window. Her color had come back.

"Did you get my letter?"

"Yes. That is what brought me here."

Another silence. Madeline slid the hand next to Aldis out of her muff. He took no notice of it at first, then suddenly his own closed over it, and crushed it hard.

"You must not go to Boston to-night," she whispered.

"Why not?"

"Because I am in such trouble!—I had to see you, after that letter. I ran after the train, and they caught hold of me and put me on before I knew what they were doing; and here I am without a ticket or a cent of money—and all because you would not come and let me—tell you——" She had hidden her face again in her muff.

"Tell me—what?" His head was close to hers, his arm against her shoulder. He could feel her long, shuddering sobs.

"How *could* I come?" he said

She did not answer. The roar and rattle

of the train went sounding on. It was very interesting to the people in the car; but Madeline had forgotten them, and Aldis cared no more for the files of faces than if they had been the rocky fronts of the bluffs that had kept a summer's watch over him and the girl beside him, and the noise of the train had been the far-off river's roar. He was in a dream which could not last too long.

Madeline lifted her head, and through the lulling din he heard her voice, saying:

"Oh, the river! I seemed to hear it last night when I was singing,—and the light on the rocks—do you remember? And I was so glad the rest was not true. And then your letter came——"

"Never mind; nothing is true—only this," he roused himself to say.

The crowded train went roaring and swaying on, as it had during all the days and nights of his journey home, mingling its monotone with the dream that was coming true at last.

SOMEWHERE in that vague and rapidly lessening region known as the frontier, there disappeared, a few years ago, a woman's voice. A soprano with a wonderful mezzo quality, those who knew it called it, and the girl, besides her beauty, had quite a distinct promise of dramatic power. But, they added, she seemed to have no imagination, no conception, of the value of her gifts. She threw away a charming career, just at its outset, and went West with a husband—not anybody in particular. It was altogether a great pity. Perhaps she had not the artistic temperament, or was too indolent to give the time and labor required for the perfecting of her rare gift—at all events the voice was lost.

But in the camps of engineers, within sound of unknown waters, on mountain trails, or crossing the windy cattle-ranges, or in the little churches of the valley towns, or at a lonely grave, perhaps, where his comrades are burying some unwitting, unacknowledged hero, dead in the quiet doing of his duty, a voice is sometimes heard, in ballad or gay roulade, anthem or requiem,—a voice those who have heard it say they will never forget.

Like the hermit-thrush, it sings in the deep woods and the solitudes. Lost it may be to the history of famous voices, but the treasured, self-prized gifts are not those which always carry a blessing with them; and the soul of music, wherever it is purely uttered, will find its listeners, though it be a voice singing in the wilderness, in the dawn of the day of art and beauty which is coming to a new country and a new people.

MACHINE POLITICS IN NEW YORK CITY.

IN New York city, as in most of our other great municipalities, the direction of political affairs has been for many years mainly in the hands of a class of men who make politics their regular business and means of livelihood. These men are able to keep their grip only by means of the singularly perfect way in which they have succeeded in organizing their respective parties and factions; and it is in consequence of the clock-work regularity and efficiency with which these several organizations play their parts, alike for good and for evil, that they have been nicknamed by outsiders "machines," while the men who take part in and control, or, as they would themselves say, "run" them, form now a well-recognized and fairly well-defined class in the community, and are familiarly known as machine politicians. It may be of interest to sketch in outline some of the characteristics of these men and of their machines, the methods by which and the objects for which they work, and the reasons for their success in the political field.

The terms machine and machine politician are now undoubtedly used ordinarily in a reproachful sense; but it does not at all follow that this sense is always the right one. On the contrary, the machine is often a very powerful instrument for good; and a machine politician really desirous of doing honest work on behalf of the community is fifty times as useful an ally as is the average philanthropic outsider. Indeed, it is of course true that any political organization (and absolutely no good work can be done in politics without an organization) is a machine; and any man who perfects and uses this organization is himself, to a certain extent, a machine politician. In the rough, however, the feeling against machine politics and politicians is tolerably well justified by the facts, although this statement really reflects most severely upon the educated and honest people who largely hold themselves aloof from public life, and show a curious incapacity for fulfilling their public duties.

The organizations that are commonly and distinctively known as machines are those belonging to the two great recognized parties, or to their factional subdivisions; and the reason why the word machine has come to be used, to a certain extent, as a term of opprobrium is to be found in the fact that these

organizations are now run by the leaders very largely as business concerns to benefit themselves and their followers, with little regard to the community at large. This is natural enough. The men having control and doing all the work have gradually come to have the same feeling about politics that other men have about the business of a merchant or manufacturer; it was too much to expect that if left entirely to themselves they would continue disinterestedly to work for the benefit of others. Many a machine politician who is to-day a most unwholesome influence in our politics is in private life quite as respectable as any one else; only he has forgotten that his business affects the state at large, and, regarding it as merely his own private concern, he has carried into it the same selfish spirit that actuates the majority of the mercantile community. A merchant or manufacturer works his business, as a rule, purely for his own benefit, without any regard whatever for the community at large; the merchant uses all his influence for a low tariff, and the manufacturer is even more strenuously in favor of protection, not at all from any theory of abstract right, but because of self-interest. Each views such a political question as the tariff, not from the stand-point of how it will affect the nation as a whole, but merely from that of how it will affect him personally; and private business is managed still less with a view to the well-being of the people at large. If a community were in favor of protection, but nevertheless permitted all the governmental machinery to fall into the hands of importing merchants, it would be small cause for wonder if the latter shaped the laws to suit themselves, and the chief blame, after all, would rest with the supine and lethargic majority which failed to have enough energy to take charge of their own affairs. Our machine politicians, in actual life, act in just this same way; their actions are almost always dictated by selfish motives, with but little regard for the people at large; they therefore need continually to be watched and opposed by those who wish to see good government. But, after all, it is hardly to be wondered at that they abuse power which is allowed to fall into their hands owing to the ignorance or timid indifference of those who by rights should themselves keep it.

In a society properly constituted for true democratic government — in a society such as that seen in many of our country towns, for

example — machine rule is impossible. But in New York, as well as in most of our other great cities, the conditions favor the growth of ring or boss rule. The chief causes thus operating against good government are the moral and mental attitudes towards politics assumed by different sections of the voters. A large number of these are simply densely ignorant, and, of course, such are apt to fall under the influence of cunning leaders, and even if they do right, it is by hazard merely. The criminal class in a great city is always of some size, while what may be called the potentially criminal class is still larger. Then there is the great class of laboring men, mostly of foreign birth or parentage, who at present both expect too much from legislation and yet at the same time realize too little how powerfully though indirectly they are affected by a bad or corrupt government. In many wards the overwhelming majority of the voters do not realize that heavy taxes fall ultimately upon them, and actually view with perfect complacency burdens laid by their representatives upon the tax-payers, and, if anything, approve of a hostile attitude towards the latter — having a vague feeling of hostility towards them as possessing more than their proper proportion of the world's good things, and sharing with most other human beings the capacity to bear with philosophic equanimity ills merely affecting one's neighbors. When powerfully roused on some financial, but still more on some sentimental, question, this same laboring class will throw its enormous and usually decisive weight into the scale which it believes inclines to the right; but its members are often curiously and cynically indifferent to charges of corruption against favorite heroes or demagogues, so long as these charges do not imply betrayal of their own real or fancied interests. Thus an alderman or assemblyman representing certain wards may make as much money as he pleases out of corporations without seriously jeopardizing his standing with his constituents; but if he once, whether from honest or dishonest motives, stands by a corporation when the interests of the latter are supposed to conflict with those of "the people," it is all up with him. These voters are, moreover, very emotional; they value in a public man what we are accustomed to consider virtues only to be taken into account when estimating private character. Thus, if a man is open-handed and warm-hearted, they consider it as a fair offset to his being a little bit shaky when it comes to applying the eighth commandment to affairs of state. I have more than once heard the statement, "He is very liberal to the poor," advanced as a perfectly satisfactory answer to the charge that a cer-

tain public man was corrupt. Moreover, working-men, whose lives are passed in one unceasing round of narrow and monotonous toil, not unnaturally are inclined to pay heed to the demagogues and professional labor advocates who promise if elected to try to pass laws to better their condition; they are hardly prepared to understand or approve the American doctrine of government, which is that the state has no business whatever to attempt to better the condition of a man or a set of men, but has merely to see that no wrong is done him or them by any one else, and that all alike are to have a fair chance in the struggle for life — a struggle wherein, it may as well at once be freely though sadly acknowledged, very many are bound to fail, no matter how ideally perfect any given system of government may be.

Of course it must be remembered that all these general statements are subject to an immense number of individual exceptions; there are tens of thousands of men who work with their hands for their daily bread and yet put into actual practice that sublime virtue of disinterested adherence to the right, even when it seems likely merely to benefit others, and those others better off than they themselves are; for they vote for honesty and cleanliness, in spite of great temptation to do the opposite, and in spite of their not seeing how any immediate benefit will result to themselves.

REASONS FOR THE NEGLECT OF PUBLIC DUTIES.

THIS class is composed of the great bulk of the men who range from well-to-do up to very rich; and of these the former generally and the latter almost universally neglect their political duties, for the most part rather pluming themselves upon their good conduct if they so much as vote on election day. This largely comes from the tremendous wear and tension of life in our great cities. Moreover, the men of small means with us are usually men of domestic habits; and this very devotion to home, which is one of their chief virtues, leads them to neglect their public duties. They work hard, as clerks, mechanics, small tradesmen, etc., all day long, and when they get home in the evening they dislike to go out. If they do go to a ward meeting, they find themselves isolated, and strangers both to the men whom they meet and to the matter on which they have to act; for in the city a man is quite as sure to know next to nothing about his neighbors as in the country he is to be intimately acquainted with them. In the country the people of a neighborhood, when they assemble in one of their local conventions, are

already mutually well acquainted, and therefore able to act together with effect; whereas in the city, even if the ordinary citizens do come out, they are totally unacquainted with one another, and are as helplessly unable to oppose the disciplined ranks of the professional politicians as is the case with a mob of freshmen in one of our colleges when in danger of being hazed by the sophomores. Moreover, the pressure of competition in city life is so keen that men often have as much as they can do to attend to their own affairs, and really hardly have the leisure to look after those of the public. Indeed, the general tendency everywhere is towards the specialization of functions, and this holds good as well in politics as elsewhere.

The reputable private citizens of small means thus often neglect to attend to their public duties because to do so would perhaps interfere with their private business. This is bad enough, but the case is worse with the really wealthy, who still more generally neglect these same duties, partly because not to do so would interfere with their pleasure, and partly from a combination of other motives, all of them natural but none of them creditable. A successful merchant, well dressed, pompous, self-important, unused to any life outside of the counting-room, and accustomed because of his very success to be treated with deferential regard, as one who stands above the common run of humanity, naturally finds it very unpleasant to go to a caucus or primary where he has to stand on an equal footing with his groom and day-laborers, and indeed may discover that the latter, thanks to their faculty for combination, are rated higher in the scale of political importance than he is himself. In all the large cities of the North the wealthier, or, as they would prefer to style themselves, the "upper" classes, tend distinctly towards the bourgeois type; and an individual in the bourgeois stage of development, while honest, industrious, and virtuous, is also not unapt to be a miracle of timid and short-sighted selfishness. The commercial classes are only too likely to regard everything merely from the stand-point of "Does it pay?" and many a merchant does not take any part in politics because he is short-sighted enough to think that it will pay him better to attend purely to making money, and too selfish to be willing to undergo any trouble for the sake of abstract duty; while the younger men of this type are too much engrossed in their various social pleasures to be willing to give their time to anything else. It is also unfortunately true, especially throughout New England and the Middle States, that the general tendency among people of culture and high education

has been to neglect and even to look down upon the rougher and manlier virtues, so that an advanced state of intellectual development is too often associated with a certain effeminacy of character. Our more intellectual men often shrink from the raw coarseness and the eager struggle of political life as if they were women. Now, however refined and virtuous a man may be, he is yet entirely out of place in the American body politic unless he is himself of sufficiently coarse fiber and virile character to be more angered than hurt by an insult or injury; the timid good form a most useless as well as a most despicable portion of the community. Again, when a man is heard objecting to taking part in politics because it is "low," he may be set down as either a fool or a coward; it would be quite as sensible for a militiaman to advance the same statement as an excuse for refusing to assist in quelling a riot. Many cultured men neglect their political duties simply because they are too delicate to have the element of "strike back" in their natures, and because they have an unmanly fear of being forced to stand up for their own rights when threatened with abuse or insult.

Such are the conditions which give the machine men their chance; and they have been able to make the most possible out of this chance,—first, because of the perfection to which they have brought their machinery, and, second, because of the social character of their political organizations.

ORGANIZATION AND WORK OF THE MACHINES.

THE machinery of any one of our political bodies is always rather complicated; and its politicians invariably endeavor to keep it so, because, their time being wholly given to it, they are able to become perfectly familiar with all its workings, while the average outsider becomes more and more helpless in proportion as the organization is less and less simple. Besides some others of minor importance, there are at present in New York three great political organizations, viz., those of the regular Republicans, of the County Democracy, and of Tammany Hall, that of the last being perhaps the most perfect, viewed from a machine stand-point. Although with wide differences in detail, all these bodies are organized upon much the same general plan; and one description may be taken, in the rough, as applying to all. There is a large central committee, composed of numerous delegates from the different assembly districts, which decides upon the various questions affecting the party as a whole in the county

and city; and then there are the various organizations in the assembly districts themselves, which are the real sources of strength, and with which alone it is necessary to deal. There are different rules for the admission to the various district primaries and caucuses of the voters belonging to the respective parties; but in almost every case the real work is done and the real power held by a small knot of men, who in turn pay a greater or less degree of fealty to a single boss.

The mere work to be done on election day and in preparing for it forms no slight task. There is an association in each assembly district, with its president, secretary, treasurer, executive committee, etc.; these call the primaries and caucuses, arrange the lists of the delegates to the various nominating conventions, raise funds for campaign purposes, and hold themselves in communication with their central party organizations. At the primaries in each assembly district a full set of delegates are chosen to nominate assemblymen and aldermen, while others are chosen to go to the State, county, and congressional conventions. Before election day, many thousands of complete sets of the party ticket are printed, folded, and put together, or, as it is called, "bunched." A single bundle of these ballots is then sent to every voter in the district, while thousands are reserved for distribution at the polls. In every election precinct — there are probably twenty or thirty in each assembly district — a captain and from two to a dozen subordinates are appointed. These have charge of the actual giving out of the ballots at the polls. On election day they are at their places long before the hour set for voting; each party has a wooden booth, looking a good deal like a sentry-box, covered over with flaming posters containing the names of their nominees, and the "workers" cluster around these as centers. Every voter as he approaches is certain to be offered a set of tickets; usually these sets are "straight," that is, contain all the nominees of one party, but frequently crooked work will be done, and some one candidate will get his own ballots bunched with the rest of those of the opposite party. Each captain of a district is generally paid a certain sum of money, greater or less according to his ability as a politician or according to his power of serving the boss or machine. Nominally this money goes in paying the subordinates and in what are vaguely termed "campaign expenses," but as a matter of fact it is in many instances simply pocketed by the recipient; indeed, very little of the large sums of money annually spent by candidates to bribe voters actually reaches the voters supposed to be bribed. The money thus

furnished is procured either by subscriptions from rich outsiders, or by assessments upon the candidates themselves; formerly much was also obtained from office-holders, but this is now prohibited by law. A great deal of money is also spent in advertising, placarding posters, paying for public meetings, and organizing and uniforming members to take part in some huge torchlight procession — this last particular form of idiocy being one peculiarly dear to the average American political mind. Candidates for very lucrative positions are often assessed really huge sums, in order to pay for the extravagant methods by which our canvasses are conducted. Before a legislative committee of which I was a member, the Register of New York county blandly testified under oath that he had forgotten whether his expenses during his canvass had been over or under fifty thousand dollars. It must be remembered that even now — and until recently the evil was very much greater — the rewards paid to certain public officials are out of all proportion to the services rendered; and in such cases the active managing politicians feel that they have a right to exact the heaviest possible toll from the candidate, to help pay the army of hungry heelers who do their bidding. Thus, before the same committee mentioned above, the County Clerk testified that his income was very nearly eighty thousand a year, but with refreshing frankness admitted that his own position was practically merely that of a figure-head, and that all the work was done by his deputy, on a small fixed salary. As the County Clerk's term is three years, he should nominally receive nearly a quarter of a million dollars; but as a matter of fact two-thirds of the money probably goes to the political organizations with which he is connected. The enormous emoluments of such officers are, of course, most effective in debauching politics. They bear no relation whatever to the trifling quantity of work done, and the chosen candidate readily recognizes what is the exact truth, — namely, that the benefit of his service is expected to enure to his party allies, and not to the citizens at large. Thus, one of the county officers who came before the same committee above mentioned, with a naïve openness which was appalling, testified, in answer to what was believed to be a purely formal question as to whether he performed his public duties faithfully, that he did so perform them whenever they did not conflict with his political duties! — meaning thereby, as he explained, attending to his local organizations, seeing politicians, fixing primaries, bailing out those of his friends (apparently by no means few in number) who got hauled up before a justice of the peace, etc.,

etc. This man's statements were valuable because, being a truthful person and of such dense ignorance that he was at first wholly unaware his testimony was in any way remarkable, he really tried to tell things as they were; and it had evidently never occurred to him that he was not expected by every one to do just as he had been doing,—that is, to draw a large salary for himself, to turn over a still larger fund to his party allies, and conscientiously to endeavor, as far as he could, by the free use of his time and influence, to satisfy the innumerable demands made upon him by the various small-fry politicians.

“HEELERS.”

THE “heelers,” or “workers,” who stand at the polls, and are paid in the way above described, form a large part of the rank and file composing each organization. There are, of course, scores of them in each assembly district association, and, together with the almost equally numerous class of federal, State, or local paid office-holders (except in so far as these last have been cut out by the operations of the civil-service reform laws), they form the bulk of the men by whom the machine is run; the bosses of great and small degree chiefly merely oversee the work and supervise the deeds of their henchmen. The organization of a party in our city is really much like that of an army. There is one great central boss, assisted by some trusted and able lieutenants; these communicate with the different district bosses, whom they alternately bully and assist. The district boss in turn has a number of half subordinates, half allies, under him; and these latter choose the captains of the election districts, etc., and come into contact with the common heelers. The more stupid and ignorant the common heelers are, and the more implicitly they obey orders, the greater becomes the effectiveness of the machine. An ideal machine has for its officers men of marked force, cunning and unscrupulous, and for its common soldiers men who may be either corrupt or moderately honest, but who must be of low intelligence. This is the reason why such a large proportion of the members of every political machine are recruited from the lower grades of the foreign population. These henchmen obey unhesitatingly the orders of their chiefs, both at the primary or caucus and on election day, receiving regular rewards for so doing, either in employment procured for them or else in money outright. Of course it is by no means true that these men are all actuated merely by mercenary motives. The great majority entertain also a real feeling of allegiance towards the party to which

they belong or towards the political chief whose fortunes they follow; and many work entirely without pay and purely for what they believe to be right. Indeed, an experienced politician always greatly prefers to have under him men whose hearts are in their work and upon whose unbribed devotion and intelligence he can rely; but unfortunately he finds in most cases that their exertions have to be seconded by others which are prompted by motives far more mixed.

All of these men, whether paid or not, make a business of political life and are thoroughly at home among the obscure intrigues that go to make up so much of it; and consequently, they have quite as much the advantage when pitted against amateurs as regular soldiers have when matched against militiamen. But their numbers, though absolutely large, are, relatively to the entire community, so small that some other cause must be taken into consideration in order to account for the commanding position occupied by the machine and the machine politicians in public life. This other determining cause is to be found in the fact that all these machine associations have a social as well as a political side, and that a large part of the political life of every leader or boss is also identical with his social life.

THE SOCIAL SIDE OF MACHINE POLITICS.

THE political associations of the various districts are not organized merely at the approach of election day; on the contrary, they exist throughout the year, and for the greater part of the time are to a great extent merely social clubs. To a large number of the men who belong to them they are the chief social rallying-point. These men congregate in the association building in the evening to smoke, drink beer, and play cards, precisely as the wealthier men gather in the clubs whose purpose is avowedly social and not political—such as the Union, University, and Knickerbocker. Politics thus becomes a pleasure and relaxation as well as a serious pursuit. The different members of the same club or association become closely allied to one another, and able to act together on occasions with unison and *esprit de corps*; and they will stand by one of their own number for reasons precisely homologous to those which make a member of one of the upper clubs vote for a fellow-member if the latter happens to run for office. “He is a gentleman, and I’ll support him,” says the swell club man. “He’s one of the boys, and I’m for him,” replies the heeler from the district party association. In each case the feeling is social rather than

political, but where the club man influences one vote the heeler controls ten. A rich merchant and a small tradesman alike find it merely a bore to attend the meetings of the local political club; it is to them an irksome duty which is shirked whenever possible. But to the small politicians and to the various workers and hangers-on, these meetings have a distinct social attraction, and attendance is a matter of preference. They are in congenial society and in the place where by choice they spend their evenings, and where they bring their friends and associates; and naturally all the men so brought together gradually blend their social and political ties, and work with an effectiveness impossible to the outside citizens whose social instincts interfere, instead of coinciding, with their political duties. If an ordinary citizen wishes to have a game of cards or a talk with some of his companions, he must keep away from the local headquarters of his party; whereas, under similar circumstances, the professional politician must go there. The man who is fond of his home naturally prefers to stay there in the evenings, rather than go out among the noisy *habitués*, whose pleasure it is to see each other at least weekly, and who spend their evenings discussing neither sport, business, nor scandal, as do other sections of the community, but the equally monotonous subject of ward politics.

The strength of our political organizations arises from their development as social bodies; many of the hardest workers in their ranks are neither office-holders nor yet paid henchmen, but merely members who have gradually learned to identify their fortunes with the party whose hall they have come to regard as the headquarters in which to spend the most agreeable of their leisure moments. Under the American system it is impossible for a man to accomplish anything by himself; he must associate himself with others, and they must throw their weight together. This is just what the social functions of the political clubs enable their members to do. The great and rich society clubs are composed of men who are not apt to take much interest in politics anyhow, and who never act as a body. The immense effect produced by a social organization for political purposes is shown by the career of the Union League Club; and equally striking proof can be seen by every man who attends a ward meeting. There is thus, however much to be regretted it may be, a constant tendency towards the concentration of political power in the hands of those men who by taste and education are fitted to enjoy the social side of the various political organizations.

THE LIQUOR-SELLER IN POLITICS.

It is this that gives the liquor-sellers their enormous influence in politics. Preparatory to the general election of 1884, there were held in the various districts of New York ten hundred and seven primaries and political conventions of all parties, and of these no less than six hundred and thirty-three took place in liquor-saloons,—a showing that leaves small ground for wonder at the low average grade of the nominees. The reason for such a condition of things is perfectly evident; it is because the liquor-saloons are places of social resort for the same men who turn the local political organizations into social clubs. Bar-tenders form perhaps the nearest approach to a leisure class that we have at present on this side of the water. They naturally are on semi-intimate terms with all who frequent their houses. There is no place where more gossip is talked than in bar-rooms, and much of this gossip is about politics,—that is, the politics of the ward, not of the nation. The tariff and the silver question may be alluded to, but the real interest comes in discussing the doings of the men with whom they are personally acquainted: why Billy so-and-so, the alderman, has quarreled with his former chief supporter; whether “old man X” has really managed to fix the delegates to a given convention; the reason why one faction bolted at the last primary; and if it is true that a great down-town boss who has an intimate friend of opposite political faith running in an up-town district has forced the managers of his own party to put up a man of straw against him. The bar-keeper is a man of much local power, and is, of course, hail-fellow-well-met with his visitors, as he and they can be of mutual assistance to one another. Even if of different politics, their feelings towards each other are influenced by personal considerations purely; and, indeed, this is true of most of the smaller bosses as regards their dealings among themselves, for, as one of them once remarked to me with enigmatic truthfulness, “there are no politics in politics” of the lower sort—which, being interpreted, means that a professional politician is much less apt to be swayed by the fact of a man’s being a Democrat or a Republican than he is by his being a personal friend or foe. The liquor-saloons thus become the social headquarters of the little knots or cliques of men who take most interest in local political affairs; and by an easy transition they become the political headquarters when the time for preparing for the elections arrives; and, of course, the good-will of the owners of the places is thereby propitiated,—

an important point with men striving to control every vote possible.

The local political clubs also become to a certain extent mutual benefit associations. The men in them become pretty intimate with one another; and in the event of one becoming ill, or from any other cause thrown out of employment, his fellow-members will very often combine to assist him through his troubles, and quite large sums are frequently raised for such a purpose. Of course, this forms an additional bond among the members, who become closely knit together by ties of companionship, self-interest, and mutual interdependence. Very many members of these associations come into them without any thought of advancing their own fortunes; they work very hard for their party, or rather for the local body bearing the party name, but they do it quite disinterestedly, and from a feeling akin to that which we often see make other men devote their time and money to advancing the interests of a yacht club or racing stable, although no immediate benefit can result therefrom to themselves. One such man I now call to mind who is by no means well off, and is neither an office-seeker nor an office-holder, but who regularly every year spends about fifty dollars at election time for the success of the party, or rather the wing of the party, to which he belongs. He has a personal pride in seeing his pet candidates rolling up large majorities. Men of this stamp also naturally feel most enthusiasm for, or animosity against, the minor candidates with whom they are themselves acquainted. The names at the head of the ticket do not, to their minds, stand out with much individuality; and while such names usually command the normal party support, yet very often there is an infinitely keener rivalry among the smaller politicians over candidates for local offices. I remember, in 1880, a very ardent Democratic ward club, many of the members of which in the heat of a contest for an assemblyman coolly swapped off quite a number of votes for President in consideration of votes given to their candidate for the State Legislature; and in 1885, in my own district, a local Republican club that had a member running for alderman, performed a precisely similar feat in relation to their party's candidate for Governor. A Tammany State senator openly announced in a public speech that it was of vastly more importance to Tammany to have one of her own men Mayor of New York than it was to have a Democratic President of the United States. Very many of the leaders of the rival organizations, who lack the boldness to make such a frankly cynical avowal of what their party feeling really

amounts to, yet in practice, both as regards mayor and as regards all other local offices which are politically or pecuniarily of importance, act exactly on the theory enunciated by the Tammany statesman; and, as a consequence, in every great election not only is it necessary to have the mass of the voters waked up to the importance of the principles that are at stake, but it also unfortunately is necessary to see that the powerful local leaders are convinced that it will be to their own interest to be faithful to the party ticket.

Often there will be intense rivalry between two associations or two minor bosses; and one may take up and the other oppose the cause of a candidate with an earnestness and hearty good-will arising by no means from any liking to the man himself, but from the desire to score a triumph over the opposition. It not unfrequently happens that a perfectly good man, who would not knowingly suffer the least impropriety in the conduct of his canvass, is supported in some one district by a little knot of politicians of shady character, who have nothing in common with him at all, but who wish to beat a rival body that is opposing him, and who do not for a moment hesitate to use every device, from bribery down, to accomplish their ends. A curious incident of this sort came to my knowledge while happening to inquire how a certain man became a Republican. It occurred a good many years ago, and thanks to our election laws it could not now be repeated in all its details; but affairs similar in kind occur at every election. I may preface it by stating that the man referred to, whom we will call X, ended by pushing himself up in the world, thanks to his own industry and integrity, and is now a well-to-do private citizen and as good a fellow as any one would wish to see. But at the time spoken of he was a young laborer, of Irish birth, working for his livelihood on the docks and associating with his Irish and American fellows. The district where he lived was overwhelmingly Democratic, and the contests were generally merely factional. One small politician, a saloon-keeper named Larry, who had a good deal of influence, used to enlist on election day, by pay and other compensation, the services of the gang of young fellows to which X belonged. On one occasion he failed to reward them for their work, and in other ways treated them so shabbily as to make them very angry, more especially X, who was their leader. There was no way to pay him off until the next election; but they determined to break his influence utterly then, and as the best method for doing this they decided to "vote as far away from him" as possible, or, in other words, to strain every

nerve to secure the election of all the candidates most opposed to those whom Larry favored. After due consultation, it was thought that this could be most surely done by supporting the Republican ticket. Most of the other bodies of young laborers, or, indeed, of young roughs, made common cause with X and his friends. Everything was kept very quiet until election day, neither Larry nor the few Republicans having an inkling of what was going on. It was a rough district, and usually the Republican booths were broken up and their ballot-distributors driven off early in the day; but on this occasion, to the speechless astonishment of everybody, things went just the other way. The Republican ballots were distributed most actively, the opposing workers were bribed, persuaded, or frightened away, all means fair and foul were tried, and finally there was almost a riot,—the outcome being that the Republicans actually obtained a majority in a district where they had never before polled ten per cent. of the total vote. Such a phenomenon attracted the attention of the big Republican leaders, who after some inquiry found it was due to X. To show their gratitude and to secure so useful an ally permanently (for this was before the days of civil-service reform), they procured him a lucrative place in the New York Post-office; and he, in turn, being a man of natural parts, at once seized the opportunity, set to work to correct the defects of his early education, and is now what I have described him to be.

BOSS METHODS.

A POLITICIAN who becomes an influential local leader or boss is, of course, always one with a genuine talent for intrigue and organization. He owes much of his power to the rewards he is able to dispense. Not only does he procure for his supporters positions in the service of the state or city,—such as the custom-house, sheriff's office, etc.,—but he is also able to procure positions for many on horse railroads, the elevated roads, quarry works, etc. Great corporations are peculiarly subject to the attacks of demagogues, and they find it greatly to their interest to be on good terms with the leader in each district who controls the vote of the assemblyman and alderman; and therefore the former is pretty sure that a letter of recommendation from him on behalf of any applicant for work will receive most favorable consideration. The leader also is continually helping his henchmen out of difficulties, pecuniary and otherwise; he lends them a dollar or two now and then, helps out, when possible, such of their kinsmen as get into the clutches of the law, gets a hold over

such of them as have done wrong and are afraid of being exposed, and learns to mix bullying judiciously with the rendering of service.

But in addition to all this, the boss owes very much of his commanding influence to his social relations with various bodies of his constituents; and it is his work as well as his pleasure to keep these relations up. No *débutante* during her first winter in society has a more exacting round of social duties to perform than has a prominent ward politician. In every ward there are numerous organizations, primarily social in character, but capable of being turned to good account politically. The Amalgamated Hack-drivers' Union, the Hibernian Republican Club, the West Side Young Democrats, the Jefferson C. Mullin Picnic Association,—there are twenty such bodies as these in every district, and with, at any rate, the master spirits in each and all it is necessary for the boss to keep on terms of intimate and, indeed, rather boisterous friendship. When the Jefferson C. Mullin society goes on a picnic, the average citizen scrupulously avoids its neighborhood; but the boss goes, perhaps with his wife, and, moreover, enjoys himself heartily, and is hail-fellow-well-met with the rest of the picnickers, who, by the way, may be by no means bad fellows; and when election day comes round, the latter, in return, no matter to what party they may nominally belong, enthusiastically support their friend and guest on social, not political, grounds. The boss knows every man in his district who can control any number of votes: an influential saloon-keeper, the owner of a large livery stable, the leader among a set of horse-car drivers, a foreman in a machine-shop who has a taste for politics,—with all alike he keeps up constant and friendly relations. Of course this fact does not of itself make the boss a bad man; there are several such I could point out who are ten times over better fellows than are the mild-mannered scholars of timorous virtue who criticise them. But on the whole the qualities tending to make a man a successful local political leader under our present conditions are not apt to be qualities that make him serve the public honestly or disinterestedly; and in the lower wards, where there is a large vicious population, the condition of politics is often fairly appalling, and the boss is generally a man of grossly immoral public and private character, as any one can satisfy himself by examining the testimony taken by the last two or three legislative committees that have investigated the affairs of New York city. In these wards many of the social organizations with which the leaders are obliged to keep on good terms are composed of criminals,

or of the relatives and associates of criminals. The testimony mentioned above showed some strange things. I will take at random a few instances that occur to me at the moment. There was one case of an assemblyman who served several terms in the Legislature, while his private business was to carry on corrupt negotiations between the excise commissioners and owners of low haunts who wished licenses. The president of a powerful semi-political association was by profession a burglar; the man who received the goods he stole was an alderman. Another alderman was elected while his hair was still short from a term in State prison. A school trustee had been convicted of embezzlement, and was the associate of criminals. A prominent official in the police department was interested in disreputable houses and gambling-saloons, and was backed politically by their proprietors.

BEATING THE MACHINE.

IN the better wards the difficulty comes in drilling a little sense and energy into decent people; they either do not care to combine or else refuse to learn how. In one district we did at one time and for a considerable period get control of affairs and elect a set of almost ideal delegates and candidates to the various nominating and legislative bodies, and in the end took an absolutely commanding although temporary position in State and even in national politics.

This was done by the efforts of some twenty or thirty young fellows who devoted a large part of their time thoroughly to organizing and getting out the respectable vote. The moving spirits were all active, energetic men, with common sense, whose motives were perfectly disinterested. Some went in from principle; others, doubtless, from good-fellowship or sheer love of the excitement always attendant upon a political struggle. Our success was due to our absolute freedom from caste spirit. Among our chief workers were a Columbia College professor, a crack oarsman from the same institution, an Irish quarryman, a master carpenter, a rich young merchant, the owner of a small cigar store, the editor of a little German newspaper, and a couple of employees from the post-office and custom-house, who worked directly against their own seeming interests. One of our important committees was composed of a prominent member of a Jewish synagogue, of the son of a noted Presbyterian clergyman, and of a young Catholic lawyer. We won some quite remark-

able triumphs, for the first time in New York politics, carrying primaries against the machine, and as the result of our most successful struggle completely revolutionizing the State convention held to send delegates to the National Republican Convention of 1884, and returning to that body, for the first and only time it was ever done, a solid delegation of Independent Republicans. This was done, however, by sheer hard work on the part of a score or so of men; the mass of our good citizens, even after the victories which they had assisted in winning, understood nothing about how they were won. Many of them actually objected to organizing, apparently having a confused idea that we could always win by what one of their number called a "spontaneous uprising," to which a quiet young fellow in our camp grimly responded that he had done a good deal of political work in his day, but that he never in his life had worked so hard and so long as he did to get up the "spontaneous" movement in which we were then engaged.

CONCLUSIONS.

IN conclusion, it may be accepted as a fact, however unpleasant, that if steady work and much attention to detail are required, ordinary citizens, to whom participation in politics is merely a disagreeable duty, will always be beaten by the organized army of politicians to whom it is both duty, business, and pleasure, and who are knit together and to outsiders by their social relations. On the other hand, average citizens do take a spasmodic interest in public affairs; and we should therefore so shape our governmental system that the action required by the voters should be as simple and direct as possible, and should not need to be taken any more often than is necessary. Governmental power should be concentrated in the hands of a very few men, who would be so conspicuous that no citizen could help knowing all about them; and the elections should not come too frequently. Not one decent voter in ten will take the trouble annually to inform himself as to the character of the host of petty candidates to be balloted for, but he will be sure to know all about the mayor, comptroller, etc. It is not to his credit that we can only rely, and that without much certainty, upon his taking a spasmodic interest in the government that affects his own well-being; but such is the case, and accordingly we ought, as far as possible, to have a system requiring on his part intermittent and not sustained action.

Theodore Roosevelt.

THE NEED OF TRADE SCHOOLS.

EDUCATION is in a transition state. Systems that have come down to us from past ages are found incapable of meeting the wants of the latter part of the nineteenth century.

Especially is this the case in the way in which the young are taught how to work. Silently the old plan has passed away, and as yet no definite scheme has taken its place. Neither in this country nor in Europe can the apprenticeship system be said to exist. It became the custom in the middle ages to bind a lad who wished to learn a trade by a written agreement to some master mechanic, for a specified number of years. In consideration of the lad's labor, the master was to care for him and teach him a handicraft. This custom continued until modern times. During the reign of Queen Elizabeth a law was passed forbidding any person to work at a trade without having first served an apprenticeship of seven years. Although this law was denounced by Adam Smith as tending to form labor monopolies, and the courts had decided it did not apply to any trade not practiced at the time of its enactment, it was not repealed until the year 1814. The English and American apprentice laws still provide for indenturing a lad to a master mechanic, but such indentures are seldom made except by the overseers of the poor for pauper lads. An indenture between a master plumber of New York and three of his "helpers" was recently published in trade journals as a curiosity. The old apprenticeship system perished, not because the indenture was looked upon as a species of slavery, nor because its results were unsatisfactory. It perished because the conditions of society under which it was possible no longer exist. The apprentice in former times lived with his master, sat at his table, and worked under his eye. For his conduct during his term of service and his skill when he became a journeyman, his master was responsible. The modern apprentice is merely a hired boy, who, while making himself useful about a workshop, learns what he can by observation and practice. If he sees the interior of his master's house, it is to do some work in no way connected with his trade, and which may not increase the idea of the dignity of labor in the minds of such of his associates as are employed in stores or offices. In old times skill more than capital

made the journeyman into a master. The master worked with his men. The more apprentices he could employ and the more thoroughly he could teach them, the greater his profit. The act of Elizabeth was intended to secure the lad's labor to the employer, not to be a law, as it afterwards became, to limit the number of workers. The master now rarely works at his trade. His time is more profitably spent in seeking for customers, purchasing material, or managing his finances. The workshop is put in charge of a foreman whose reputation and wages depend on the amount of satisfactory work that can be produced at the least cost. The foreman has no time to teach lads, and as there is but little profit in their untrained labor, does not usually want them. There still survives from the old apprentice system of former days the idea that a lad employed in a workshop shall, when he becomes a man, be a skilled workman and capable of earning a journeyman's wages. This theory fixes a certain amount of responsibility upon an employer, which he is not always willing to incur. Business may increase or diminish. At one time many workmen may be wanted; at other times few or none. If lads are employed with the understanding that at the expiration of a certain time they are to be converted into skilled workmen, there may be times during the customary four years of service when there will be nothing for them to do. If retained they will be a burden on the employer; if discharged the lad will not unreasonably feel that an agreement has been broken. It is not, however, with the employer that all the difficulty of learning how to work is to be found. The different trades are organized into trades-unions, and one of the accepted theories of the unions is the advantage to be derived from limiting the number of workers. Instead of the fact that work makes work, that one busy class gives employment to other classes, it is assumed that there is a certain amount of work to be done, and the fewer there are to do it the higher wages will be. It is, therefore, sought to make each trade into a monopoly, and although these efforts have been uniformly unsuccessful, they have marred the lives of thousands of young men, and still continue to do so. Such monopolies are not possible, because foreign mechanics, attracted by wages several times greater than they could earn at home, with living but little, if any, dearer, can-

not be prevented from crossing the ocean to better their condition in life; neither can mechanics be prevented from coming to the cities from country towns, and as the strength of a union depends upon the enrollment of nearly all the workmen in the trade the union represents, these mechanics are not only invited to join, but pressure is used to force them to do so. Thus, as the exclusive policy of the unions is powerless against the stranger, its force is directed against city-born young men. This term is used because in country towns there are no unions, and consequently no opposition is made to a lad's learning a trade, if he can find some master workman who is willing to employ him. In the country, however, the standard of workmanship is not so high as it is in cities, and country mechanics cannot usually compete on even terms with city workmen. Under union rules the employer is usually allowed from two to four lads, the term of service being from four to five years. This does not allow an employer to graduate under the most favorable circumstances more than one skilled workman each year. As there are not many employers even in the largest cities in any one trade, and, as already stated, some do not want young men, it becomes a matter of no small difficulty to learn how to work. So it often happens that although a lad may be willing to work and may have strong predilections for certain kinds of work, he is more likely to meet with rebuff than encouragement. His first lesson in life teaches him that he has been born into a world where there is nothing for him to do. This lesson as he grows older he will unlearn. He will discover he was standing in a busy market-place, importuning the crowds to buy when he had nothing to sell. He was willing to do anything; there was nothing he knew how to do.

The old apprentice system is not likely to be revived. The life of the system was the personal supervision of the master, which the lad cannot have again. It may be for the interest of the master mechanic to train good workmen, but it is not his duty. The attempt to teach any large number of lads would be troublesome, even if permission could be obtained from the unions. The workmen of the future must learn how to work before they seek employment. All professional men do this. What scientific schools are to the engineer and architect, what the law school and the medical college are to the lawyer and the physician, or what the business college is to the clerk, the trade school must be to the future mechanic.

Manual instruction in schools especially designed for the purpose is not a new thing.

Its rapid development in modern times is due less to the decay of the apprenticeship system than to the discovery that without such instruction the trades themselves were deteriorating. Transmitting a handicraft from man to boy carries with it wrong as well as right ideas. The practice of a trade may be taught; the theory on which that practice is based may be forgotten. The tendency of all shops is to subdivide work. A boy learns how to do one thing, and is kept at it. He has no chance to learn his trade. Trade schools first came to be regarded as important to the welfare of the state on the continent of Europe about the middle of the last century. In England, as in this country, they are of more recent origin. The report of the Royal Commissioners on Technical Instruction, London, 1884, shows not only the extent of technical instruction in European countries, but the value that is placed upon it by the people. This report gives descriptions of schools for the building trades, for weaving in wool and silk, for iron-work, furniture, clock and watch making, pottery, for the making of beer and sugar, indeed for almost every industry in which men and women are engaged. Many of these European schools, both those for general instruction in the mechanic arts and for special trades, are on a magnificent scale. At the Imperial Technical School at Moscow the annual expenses are \$140,000 per annum. The Technical School at Verviers, in Belgium, chiefly a school for weaving and dyeing, was built at a cost of \$100,000, the annual expenses being upwards of \$13,000. The Chamber of Commerce of Crefeld, in Prussia, a town of 83,000 inhabitants, having reported that the silk industry was languishing because of the superiority of the French training-schools, an establishment costing \$210,000 was begun, to which the state contributed \$137,000 and the municipality \$60,000, the remainder being raised by subscription. This town exports upwards of twenty millions of dollars of silk products, nearly all of which goes to England and the United States. At Chemnitz, in Saxony, now the rival of Nottingham in the hosiery business, and also the center of an iron industry, is a technical school which costs \$400,000. The report referred to says there is not a manufacturer in Chemnitz whose son, assistant, or foreman has not attended this school. At Hartman's locomotive works in the same town, employing nearly three thousand men, all the boys between fourteen and sixteen years of age are obliged to attend the technical school. To allow sufficient time to do so, their hours of labor terminate at four o'clock in the afternoon twice each week.

IN THE STONE-CUTTING ROOM.

At Arco, in the Austrian Tyrol, the founding of a small school with one teacher to give instruction in the manufacture of those articles in olive-wood which find so ready a sale to travelers, developed an important industry, orders being now filled from all parts of Northern Italy and from America. The city of Paris maintains a school on the Boulevard de la Villette for workers in wood and iron. Full wages are obtained, it is claimed, by the graduates from this school. A similar school is maintained in Paris by the Roman Catholic Church, with the idea of combating the irreligious sentiments of Parisian workmen. Besides the technical schools in various parts of France, free evening lectures are given in the large towns on scientific subjects connected

with the trades. In Sweden, according to a report made by Professor Ordway to the Massachusetts State Board of Education, there are about three hundred schools where manual instruction in the use of tools for wood and iron work is given. As a curiosity of technical education, it may be mentioned that in Ireland the Royal Agricultural Society maintains a model perambulating dairy, which, mounted on wheels, is drawn from village to village, the inhabitants being invited to witness the most approved methods of making butter and managing a dairy. In England the subject of technical education is now attracting much attention. A very fine school for apprentices has recently been completed by the city and guilds of London, and these

guilds also encourage technical education by subsidies to schools in different parts of the kingdom.

Some idea of the need of instruction in the mechanic arts in the United States was probably present in the minds of the Senators and Representatives when the Land Grant Act of 1862 was passed. A clause in this act reads as follows: "The leading object shall be, without excluding scientific and classical

TEACHER AND PUPIL.

studies, and including military tactics, to teach such branches of learning as are related to agriculture and the mechanic arts in such manner as the States may respectively prescribe, in order to promote the liberal and practical education of the industrial classes in the several pursuits and professions of life." The report of the Secretary of the Interior, on Industrial Education, 1882, gives a list of forty-two different schools and colleges in various parts of the union which owe their existence to this land grant. Most of these are agricultural and engineering colleges. The words in the act in regard to teaching such branches of learning as are related to the mechanic arts being usually interpreted to mean instruction in the use of carpenter's and machinist's tools. Of these land grant schools, the best known are the Massachusetts Institute of Technology in Boston and the Hampton Institute at Hampton, Virginia. Each of these illustrates an interesting experiment in industrial education. The Massachusetts Institute of Technology might properly be called a school for foremen, as its graduates can be found superintending indus-

trial establishments all over the United States. The pupil in weaving, for instance, is required to design or copy a pattern, and then work it out on the loom. In molding he makes a drawing, models the wooden pattern from it, and casts the pattern in the metal. The course of instruction is four years,—mathematics, chemistry, history, and the modern languages forming a part of the educational scheme. Hampton Institute was founded by General S. C. Armstrong as a normal school for colored teachers. General Armstrong, while serving as a staff-officer at Fort Monroe, during the war, was brought in contact with the fugitive slaves who took refuge at the fort. When slavery was abolished, and four millions of men, women, and children became the wards of the nation, General Armstrong conceived the idea that they could best be educated and civilized by the aid of their own people. It was as necessary to teach this vast multitude who had never been beyond the sound of a master's voice how to work for themselves, and how to care for themselves, as it was to teach them to read and write. Manual instruction was therefore a necessity at the Hampton Institute. The male graduates were to be leaders on the farm or in the workshop as well as teachers. The female graduates were to be capable of cooking, sewing, or caring for the sick. How thoroughly and successfully this scheme has been carried out need not be stated here. Another type of the industrial school is to be found in the Worcester (Mass.) Free Institute. At this institution three and a half years of general education is combined with instruction in mechanical engineering, in carpentering, and in machinist's work. This school more nearly approaches the trade school, as many of its graduates are returned as "journeymen mechanics." The Worcester school was founded by private liberality. Without such aid, it may be added, neither the Massachusetts Institute of Technology nor Hampton Institute could have reached its present usefulness. In the European technical schools provision is made for instructing young men already in the trades by a course specially adapted to their wants. In this country this important branch of industrial education has received but little attention. The Carriage Makers' Association in this city maintain a school in designing and construction for the young men in their trade. The Master Plumbers of Philadelphia, Baltimore, and Chicago have plumbing schools for their "helpers." The Cambria Iron Works in Pennsylvania, and several private firms like R. Hoe & Co. of this city, give scientific instruction to their lads, while two railroad companies, the Pennsylvania and

the Baltimore and Ohio, have shown not only what it is possible to do, but how much can be done at a trifling cost for the young men in the employ of great corporations. Beyond this short list, little has been done to supplement shop-work with systematic instruction. In the Baltimore and Ohio R. R. Company's shops at Baltimore five hundred young men are employed. They are placed in charge of a graduate of the Stevens Institute whose duty it is to see that they are not employed too long at one kind of work. He can change their work as often as it may seem desirable for their future interests. He can also take parties of them from their work at any time to explain to them the machinery they may be engaged upon or may see around them. A neat building has been erected for their use, which contains a library and class-rooms for instruction in mechanics and drawing. The lads are required to wear a uniform, which, besides giving them a jaunty appearance, tends to habits of personal neatness. What is done by the Baltimore and Ohio R. R. Co. could be done in any manufacturing town by the union of a few large employers.

The difference between manual instruction and trade instruction is not always clear in the public mind. By manual instruction is meant teaching a lad how to handle certain

ever having held a tool in his hands. Manual training-schools are meant to make a lad handy; trade schools to make him proficient in some one art by which he can earn a living. Manual instruction has already been incorporated in the public school systems of Boston and Philadelphia. The New York Board of Education has maintained for several years a workshop at the Free College. It now proposes to open schools all over the city where boys and girls will be taught to use their hands. A great impression was made last spring by the exhibition, held by the Industrial Education Association of New York, of children's handiwork, and of the different methods of teaching them how to work. Not only was it shown what varied and excellent work little fingers could do, but school-teachers and superintendents came to testify that the brain-work was benefited by the hand-work.

Admitting that trade education is practicable and that it is advisable both for the purpose of giving young men an opportunity to learn how to work and to keep the trades from deteriorating, it may be well to consider how such education can best be adapted to the wants of the American people.

In most of the foreign trade schools the technical instruction is combined with a gen-

WOOD-CARVING.

tools, usually carpenter's and blacksmith's tools, for the purpose of developing his hands and arms, precisely as other lessons are given to develop his observation or his memory. This is not teaching a trade, although it would render the work of the trade school much easier. A lad who has gone through a course of manual instruction at a school would be more likely to be a better mechanic than one who had reached seventeen or eighteen years of age without

eral education, the course extending over several years. This system is also followed at the Hampton Institute, at the Indian school at Carlisle Barracks, at the Worcester Free Institute, and at the reformatories and asylums in this country where trades are taught. Except in special cases there seems no need of combining instruction in the trades with a general education. It is duplicating the work of the public schools and adding greatly

PLASTERING.

to the cost of industrial education. A lad can hardly be taught and boarded, even at a school or college which is liberally endowed, for less than two hundred and fifty dollars per annum. For a four-years' course this would be a thousand dollars, and to this sum must be added the cost of clothing, traveling expenses, etc. Such schools would be beyond the reach of those who are likely to lay brick, cut stone, or work at any of the mechanic arts. A simpler, shorter, more economical course of instruction is wanted for the future mechanic. It must be remembered that although the law requires the parent to support the child, it is an established custom that after a certain age the child shall in some way contribute to the family support. No system of trade instruction will be successful that does not recognize this fact. From eighteen to twenty years would seem to be the best age to enter a trade school. The lad is then old enough to know

what sort of work he likes and for what his strength is adapted. As regards the amount of instruction given, it would be wisest not to attempt to graduate first-class journeymen. That it is possible to do so in many trades there need be no doubt, but it would appear to be better to ground a young man thoroughly in the science and practice of the trade he has chosen, and leave the speed and experience that comes from long practice to be acquired at real work after leaving the school. Such a system would be more economical, as by it the cost of teaching and the waste of material would be greatly lessened. This probation course, as the time spent between leaving the trade school and becoming a skilled workman might be called, need not be long. Six months will suffice in most trades. Young men who begin work in this way are likely to get on better with their fellow-workmen than if taught entirely at a school,

BUILDING PIERS IN THE BRICKLAYING ROOM.

and they will understand better how to accommodate themselves to different situations. Trade schools should not be free. They will be best appreciated when an entrance fee is required. Lawyers, physicians, engineers, architects, and clerks are expected to pay for their instruction, and there is no need to treat mechanics as objects of charity; neither do they desire it.

At the Hampton and Worcester schools the work of the pupil yields a revenue. At Hampton, contrary to the usual experience, a student's labor has been found to be of sufficient value to pay for his board and tuition. When the course of instruction at a trade school is short, it is best not to seek for any return from the pupil's work. The same temptation, otherwise, will exist as in the shop, of putting a lad at what he can do best instead of teaching him what he knows least about. The pupil's future is of more consequence

than the material that may be wasted. In a well-organized trade school the waste is not a serious item, as the same material can be used many times.

In the belief that the most practical system was a combination of the trade school and the shop, of grounding young men thoroughly in the science and practice of a trade at the school, and leaving them to acquire speed of workmanship and experience at real work after their course of instruction was finished, the New York Trade Schools on First Avenue, between Sixty-seventh and Sixty-eighth streets, from which the accompanying engravings were made, were opened in the autumn of 1881. The schools were designed to aid those who were in the trades by affording them facilities to become skilled workmen not possible in the average workshop, and to enable young men not in the trades to make their labor of sufficient value to secure work and to become

skilled workmen in a short period after leaving the schools. The instruction was given on three evenings each week from November until April. Skilled mechanics were employed as teachers. How much it would be possible to teach during that limited time was unknown, neither were there any means to ascertain what effect the instruction received at the schools would have on the young man's success in life. Instruction was given the first season in two

A FRESCO-PAINTER.

trades, plumbing and fresco-painting. The charge for instruction was made nominal to induce attendance. Twenty young men joined the plumbing class, about two-thirds of whom were in the trade as plumbers' "helpers," and thirteen joined the fresco class. Of this number one-third dropped off during the winter. The schools have now completed their fifth season. The attendance has increased from thirty-three the first season to three hundred and four the fifth season. The charges have been increased to a sum which it is hoped will ultimately meet the expenses of the schools. Instruction is now given in plumbing, fresco-painting, bricklaying, stone-cutting, plastering, carpentry, wood-carving, and gas-fitting. A class in pattern-making was abandoned for lack of support. Those who came to the schools from workshops surprised their employers and comrades by their suddenly acquired skill. Those who came to learn a trade have usually found work. There is a record at the schools of many of this latter class, who, to use the expression of more than one of them, owe their success in life to having joined the schools. Serious difficulties have to be encountered in obtaining work on account of

trades-union rules, but these difficulties have not been found to be insurmountable.

As the time spent at the schools is short, the instruction is given on a prescribed course. Each pupil is required to begin at the beginning and is advanced as rapidly as his proficiency will allow. Although the classes are kept as much as possible on the same work, no one is allowed to leave his work until he can do it well. Progress is necessarily rapid. A skilled workman is constantly on hand to show how the work should be done and explain why one method is right and another wrong. Attention is also given to the way a lad stands and how he holds his tools. An awkward habit once contracted is not easily overcome. On two occasions additions were made to the schools by the bricklaying class. The work was done at the termination of the regular course of instruction, the young men being paid in proportion to the number of bricks laid. This practice was found to be of so much value that the evening instruction for the bricklayers is now supplemented by two weeks' day work. The brick-work of three stores and a large apartment-house has also been almost entirely done by trade school young men. Better or more conscientious work it would be difficult to find. Those young men who are old enough to do a full day's work usually get from one-third to one-half a day's wages on leaving the schools, and full wages in from six to eighteen months afterwards. Thus it seems to be proved that a course of carefully arranged instruction on three evenings each week for a term of not quite six months, puts it in the power of any young man to learn how to work. He no longer need beg the employer to teach him. He stands in the labor market with something to sell.

Although the system followed at the New York Trade Schools could perhaps be improved, it has the merit of giving those who are likely to attend such schools what they want. Many well-meant schemes have failed because this point was overlooked. A longer course would be better; indeed, some young men lengthen their term of instruction by laboring two seasons, but to many, and often to the best, even a single season is a heavy tax on their strength. To work all day for a present living, and then to begin again and work during the evening to acquire the skill necessary to obtain a living in the future, requires no small amount of energy and self-denial. Work in the shop ceases at six o'clock. Work at the school can hardly begin later than seven. This leaves one hour only for food, for rest, and for travel. The young men at the New York Trade Schools come from all parts of New York, from Brooklyn, Hobo-

PLUMBING.

ken, and Jersey City. Some have come from Staten Island, Newark, and Orange. Between two and three hundred young men thus assembled to learn how to work, and who have paid their hard-earned money for the privilege, may almost be said to form an impressive sight. These young men are employed in offices and stores, in mills and workshops, and at the various occupations for which boy labor is needed, but which have no future for the man. During the five winters the schools have been open, no rude or profane word has been heard within their walls. The young men are attentive to their instructors, and although often inconveniently crowded, are courteous to each other. Costly tools are scattered about, but they are cared for as if they belonged to those who use them. If they are fair specimens of a class which comprises fully two-thirds of the young men of this city, New York has reason to be proud of her sons.

It is often said that American parents are not desirous of having their children learn trades. The mothers, perhaps, may be responsible for this idea. The present custom of requiring a lad to work for four or five years before becoming a journeyman necessitates his beginning at an early age. Plac-

ing boys during ten hours a day with men of whose antecedents nothing is known is undoubtedly objectionable. Although less evil comes from it than is usually supposed, still injury may be done which a careful parent would guard against. A trade school not only avoids any danger of this kind, but it gives the parent an opportunity to ascertain for what sort of work the boy is suited. As it is now, the lad may work for several years at a trade and then find he has no taste for it. New places are not easily found; to change his trade may be impossible. He becomes a poor workman without interest or heart in his work. Six months at a trade school would be time well spent if it only taught the lad for what work he is fitted.

Could the opposition of the trades-unions to young men learning trades be overcome, a great source of wealth would be opened to those now approaching manhood. This opposition comes almost entirely from foreign-born workmen. The effect of their policy is a matter of indifference to them. Unlike the American, the foreigner cares but little for the future. He looks only to the number of dollars it is possible to extract for a day's work. He willingly surrenders his liberty and his judgment to his union officers. To keep their

places, these officers must be able to force the employers to obey the union rules. They not only believe in the advantages to be derived from limiting the number of workers, but they fear that if many lads are allowed to work, the employer, with the aid of his apprentices, can withstand a strike. This fear is as groundless as the theory of the benefit of trade monopolies is mistaken. Skilled work can only be done economically by skilled workmen. The master mechanics put but a small value on boy labor. Even the Chicago Master Plumbers, in their effort to educate their "helpers," do not make it easier to enter the trade. The Journeymen Stone-cutters' Union is the only union in New York which has shown any interest in the welfare of young men. The Journeymen Plumbers' Union lately passed a resolution which, if acquiesced in by the Master Plumbers' Association, will prevent three out of every four of the young men now learning the plumbing trade in this city from becoming mechanics. Until lately, the right of a man to follow any honest calling he may see fit, provided he does not violate the laws, has not been questioned. This right is now being reasserted. It is not the province of any body of men, certainly not of any self-constituted organization, to decide who or how many shall be allowed to work. No legislature is intrusted with such power. If a trade needs protection, it can be obtained in a legal manner. Lawyers and physicians seek to guard their professions and the public from incompetent men by legal enactments. The law requiring the examination and licensing of journeymen plumbers in the cities of New York and Brooklyn was intended to protect the public from ignorant workmen. Its provisions, with slight alterations, could be made to apply to any trade. The higher the standard of workmanship is made by which admission to a trade could be procured, the better for the trade and the public. Such a system would be better than "cards of protection" obtained by favor or by purchase. "An equal chance and no favor" are not idle words to the American mind. Mechanics did not invent their trades, they have no proprietary

GOING HOME.

rights in them. Some trades have been handed down from remote antiquity. Some have deteriorated instead of improving. Roman masonry was better than our own. In metal-work we do not excel the mechanics of the middle ages. Furniture of the time of Louis XVI. is preserved in art collections for its elegance and the beauty of its workmanship. The demand for skilled labor all over the United States far exceeds the supply. To such work city-born young men are admirably adapted. They are handy, quick, and generally well educated. They should not only supply the home demand, but the demand which comes from villages that are becoming towns, and towns that in a few years will be cities. A thorough knowledge of a trade often yields its possessor, if he works but two hundred days in the year, an income equal to that received from twenty thousand dollars invested in government bonds. Is this harvest to be reaped by the stranger and the foreigner, or are our own people to have a share?

Richard T. Auchmuty.

THE HUNDREDTH MAN.*

BY FRANK R. STOCKTON,

Author of "Rudder Grange," "The Lady, or the Tiger?" "The Late Mrs. Null," etc.

I.

N one of the liveliest portions of a very lively metropolitan street was situated the popular resort known as Vatoldi's. It was a restaurant which owed its extensive patronage to the inducements it offered to persons of refined tastes and moderate purses. It was in a shopping district, and from early breakfast-time until a very late dinner or supper hour, Vatoldi's seemed never to be without customers, and John People seemed always to be behind the little desk near the entrance of the long and handsome room. In fact he was not always there, because his manifold duties required his presence in a great many places, but if a customer looked up from his meal and did not see John at his ordinary post, he would be very likely to see him there the next time he looked up, and thus an impression was produced on the minds of patrons similar to the impression given by the juggler who makes one believe that because an object has been in one place a great many times it is always there.

John People was a young man of a vigorous and rotund figure, with a slightly upturned nose, very light-brown hair brushed smoothly on his well-rounded head, and a general expression of sad good humor combined with sleepless perspicacity. Dutiful resignation to his lot raised his eyebrows and slightly wrinkled his forehead, but his wide open eyes gazed steadily on the business in hand as if they had nothing to do with the future or with retrospection, no matter how the brow might choose to occupy itself.

There was about John an air of strong independence associated with a kindly willingness, which made it a pleasant thing to watch him as he attended to his varied duties. He was the chief man and manager at Vatoldi's, and although the cooks cooked, the waiters waited, and the little boy opened the door for the ladies, as they had been taught to cook, wait, and open, they all appeared to act under John's personal direction, as if they had been an orchestra moved by a conductor's baton. He was not the owner of the establishment,

and yet he was the only visible head. Early in the morning he went to the markets and selected the most desirable meats and vegetables. He personally inspected the commodities of grocers and fruiterers, and he brought a keen investigation to bear upon the necessary supplies of wines and malt liquors. All expenditures were made by him, and all receipts went into his money drawer, and were daily deposited by him in a neighboring bank. But, although he thus stood at the head of affairs, there seemed to be nothing which John was unwilling to do. If a truck arrived with some heavy merchandise, John would put his hat upon his smoothly brushed locks, and, with a slightly rolling yet energetic step, would proceed to the sidewalk and give what directions might be needed, even sometimes lending a very strong hand to a piece of difficult lifting or lowering. The moment this duty was done he would step vigorously back to his post, hang up his hat, leaving his locks as smoothly brushed as ever, and be ready again to receive the money of his customers. There was a young man who acted as cashier during his superior's occasional absences from the desk, but nearly all the money that went into the till passed directly through John People's hands.

Vatoldi's was a remarkably well-ordered establishment; its viands, its service, and its general equipment were all of the best; and yet its prices were extremely reasonable. To combine the advantages of the two classes of restaurants generally found in American cities seemed to be the moving principle of John People's mind. To dine or lunch well at Vatoldi's, one did not need to bring a friend with him to share the expense and help eat a supply of food over-abundant for one person. Instead of that, one had enough, paid not too much, and went away with pocket and stomach equally satisfied. There was nothing, however, in the aspect of Vatoldi's to suggest the ordinary cheap American restaurant. There were no shelves filled with tin cans and bottles, no tables spread with pies and cakes. Everything was in tasteful order, and placards of any kind were totally tabooed. Even on the outer front one read but the words, above the plate-glass door:

"VATOLDI
BREAKFAST AND DINING ROOMS."

Yet there was not a total absence of display of viands. After the fashion common to English hostelries, a large round table stood near the center of the room, on which were set out huge cold joints, poultry, and game, in order that such persons who knew, or supposed they knew, exactly what they liked to eat, could say to the waiter, "Cut me a slice from here, or there," or, "Let me have the liver wing of that fowl." It was surprising with what faithfulness the clear eyes of John People, looking out from under his resigned brow, kept themselves upon these details.

It was towards the end of May, and the weather was getting to be very pleasant for outdoor life, and it was about one o'clock in the day,—an hour at which the thought of Vatoldi's began to be very pleasant to a great many people,—when there walked into the already well-filled room a tall gentleman, who took his seat at a small table at the extreme upper end of the room. As he walked slowly up the whole extent of the apartment, his glossy hat held carefully in one hand, while the other carried his silver-mounted cane, most of the people seated at the tables looked up at him as he passed; and he, in turn, gazed from side to side with such particularity that his eyes fell upon every person in the room, to many of whom he bowed, or rather nodded, with a certain stiffened graciousness that was peculiarly a manner of his own. This gentleman was a regular habitué of Vatoldi's, and was a personage so very well known in the metropolis that he seldom entered an assembly of any size in which he did not meet some one with whom he was acquainted. His name was Mr. Stull, or, as signed by himself, J. Weatherby Stull. He was not only tall, but large, bony, and heavy. His clothes were of a costly quality, and had the appearance of being quite new. He had a good deal of watch-chain, and wore several heavy rings. His manner was grave and even solemn, but, when occasion required it, he would endeavor to produce upon the minds of his inferiors the impression that there were moments when they need not look up to J. Weatherby Stull. This was a concession which he deemed due from himself to mankind.

Mr. Stull was a very rich man, and his business operations were of various kinds. He was president of a bank; he was a large owner and improver of real estate, and it was generally understood that he had money invested in several important enterprises. He lived with his family, in a handsome house, in a fashionable quarter of the city, and his

household affairs were conducted with as much state as he considered compatible with republican institutions.

In addition to his other occupations, Mr. Stull was the proprietor of Vatoldi's, but this fact was known to no one in the world but himself and John People.

This establishment, which he had owned for many years, had been placed, upon the death of the former manager, in the charge of John People. John was a young man to hold such a responsible position, but Mr. Stull had known him from a boy and felt that he could trust him. Mr. Stull was a very good judge of the quality of subordinates, especially in a business of this kind. Those who gave John People credit for keeping such an excellent restaurant, and even those who supposed that the never-to-be-seen Vatoldi might sometimes help him with advice, gave the young man entirely too much credit. He was capable, quick-sighted, willing, and honest, but he seldom did anything of importance which had not been planned and ordered by Mr. Stull.

This gentleman was, in fact, one of the best restaurant keepers in the world. His habits of thought, his qualities of mind, all combined to make him nearly perfect in this vocation. Every day, after John had made his deposit at Mr. Stull's bank, he went into the president's private room and had a talk with him. If anybody noticed his entrance it was supposed that the young man was consulting with Mr. Stull in regard to the investment of his profits. But nothing of this kind ever took place. John had no share in the business and no profits, and the conversation turned entirely upon beef, lamb, mutton, early shad, and vegetables, and the most minute details of the management of Vatoldi's kitchen and dining and breakfast room. Every afternoon John received careful directions as to what he was to buy, what dishes he was to have prepared, and, in general, what he was to do on the following day. On the following day he did all this, and Vatoldi's was the most popular resort of its kind in the city.

But, notwithstanding the fact that in the management of his restaurant Mr. Stull showed a talent of the highest order, and notwithstanding the fact that his present wealth was founded on the profits of this establishment, and that its continued success was the source of higher pride and satisfaction than the success of any other of his enterprises, he would not, on any account, have it known that he was the proprietor of Vatoldi's. His sense of personal dignity and the position of himself and family in society positively forbade that the world should know that J. Weatherby Stull

was the keeper of a restaurant. He had thought, at times, of cutting loose from this dangerous secret and selling Vatoldi's; but there were many objections to this plan. He did not wish to lose the steady income the business gave him, an income that could always be depended upon, no matter what the condition of stocks and real estate; he did not wish to give up the positive pleasure which the management of the establishment afforded him; and he felt that it would be a hazardous thing to attempt to sell the business without betraying his connection with it.

So Vatoldi's went on, and Mr. Stull's position went up, and John People's honor and vigilance, the rock on which they both rested, were always to be depended upon.

Mr. Stull always took his luncheon at Vatoldi's, and he believed that the fact of his being a constant patron of the establishment was one cause of its popularity. If a man in his high position took his meals there, other people of fashion and position would be likely to do the same.

"I like Vatoldi's," he would say to his friends, "because you can get as good a meal there as at any of the high-priced fancy places, without having to pay for any nonsense and frippery. Of course the extra cost of taking my meals at one of these fashionable restaurants would make very little difference to me now, but I should never have reached the position in which I at present find myself if I had not always made it a point to get the worth of my money. And, besides, it's a sensible place. They give you steel knives for your meats, and keep the silvered ones for fish and fruit, just as it's done in high-toned English society. And you are waited on by men who look like clean waiters, and not like dirty gentlemen."

As on this fine May afternoon Mr. Stull sat at his meal, which was the best the place afforded, for in every way he liked to set a good example to those around him, his eyes continually traversed the length and breadth of the room; and had there been anything out of the way John People would have heard of it that afternoon when he came to the bank. While he was thus engaged, a coupé, drawn by a pair of small sorrel horses, with tails trimmed in English fashion, stopped before Vatoldi's, and a handsomely dressed young lady got out and entered the restaurant. Mr. Stull's eyes brightened a little at this incident, and he looked about to see if other people had noticed the entrance of the new-comer. The young lady was his oldest daughter, and he had always encouraged his family to come to Vatoldi's whenever they happened to be shopping at lunch time. He did not think it wise

to say so, but he liked them to come in a carriage. Whenever bad weather gave him an excuse, he always came in a carriage himself. Nothing would have pleased him better than to have the street in front of Vatoldi's blocked by waiting carriages.

The entrance of Miss Stull had not been more quickly and earnestly noticed by her father than by John People. The eyes of that young man were fixed upon her from the moment she leaned forward to open the carriage door until she had been conducted to an advantageous vacant table. This was not near the one occupied by her father, for the young lady did not care to walk so far into the room as that.

In a refrigerator, near his little desk, John kept, under his own charge, certain cuts of choice meats which he handed out to be cooked for those customers who had specific tastes in regard to such things. In one corner of this refrigerator John kept a little plate on which always reposed a brace of especially tender lamb chops, a remarkably fine sweetbread, or some other dainty of the kind. When Miss Stull happened to come in, the waiter was always immediately instructed to say that they had that day some very nice chops or sweetbread, as the case might be; and the young lady being easily guided in matters of taste of this kind generally ordered the viand which John had kept in reserve for her. Sometimes, when she did not come for several days, John was obliged to give to some one else the delicacy he had reserved for her, but he always did this with a sigh which deepened the lines of dutiful resignation on his brow.

Miss Stull was a young lady of rather small dimensions, quite pretty, of a bright mind and affable disposition, and entirely ignorant that there was a man in the world who for three days would keep for her a brace of lamb chops in a corner of a refrigerator. John's secret was as carefully kept as that of his employer, but the conduct of Vatoldi's was no greater pleasure to Mr. Stull than were the visits to that establishment of Mr. Stull's daughter to John People.

When Mr. Stull had finished his meal, he walked slowly down the room and stopped at the table where his daughter still sat. That young lady thereupon offered to finish her meal instantly, and take her father to the bank in the coupé.

"No, my dear," said Mr. Stull, "there is no occasion for that. Never hurry while you eat, and be sure to eat all you want. Do you continue to like Vatoldi's?"

"Oh, yes, papa," said Miss Stull, "everything is very nice here, and I am sure the place is respectable."

"It is more than respectable," said Mr. Stull a little warmly. Then, toning down his voice, he continued: "If it were not everything it ought to be, I should not come here myself, nor recommend you and your mother to do so. I always find it well filled with the best class of people, many of them ladies. Bye-bye until dinner-time."

Then he walked to the desk and paid the amount of his bill to John People, with never a word, a gesture, or a look which could indicate to the most acute observer that he was putting the money into his own pocket.

Mr. Stull had scarcely creaked himself out of Vatoldi's when there entered an elderly man dressed in a suit of farmer's Sunday clothes. His trousers were gray and very wide, his black frock-coat was very long, and his felt hat, also black, had a very extensive brim. Deep set in his smooth-shaven face were a pair of keen gray eyes which twinkled with pleasure, as, with outstretched hand, he walked straight up to the desk behind which John People stood. John cordially grasped the hand which was offered him, and the two men expressed their satisfaction at seeing each other in tones much louder than would have been thought proper by Mr. Stull, had he been present.

"I am glad to see you, Uncle Enoch," said John. "How did you leave mother?"

"She's as lively and chipper as ever," said the other. "But I didn't come here only to see you, I came to get somethin' to eat. I want my dinner now, and I'll stop in in the afternoon, when people have thinned out, and have a talk with you."

As he said this, Mr. Enoch Bullripple moved towards the only vacant place which he saw, and it happened to be on the opposite side of the little table at which Miss Stull still sat, slowly eating an ice. At first John seemed about to protest against his uncle's seating himself at this sacred table, although, indeed, it afforded abundance of room for two persons; but then it shot into his mind that it would be a sort of bond of union between himself and the young lady to have his uncle sit at the same table with her. This was not much of a bond, but it was the only thing of the kind that had ever come between Miss Stull and himself.

When Mr. Bullripple had taken his seat, and had ordered an abundant dinner of meat and vegetables, he pushed aside the bill of fare, and his eyes fell upon Miss Stull, who sat opposite to him. After a steady gaze of a few moments, he said: "How d'ye do?"

Miss Stull, who had thrown two or three glances of interest at her opposite neighbor, which were due to his air of countrified

spruceness, now gave him a quick look of surprise, but made no answer.

"Isn't this Matilda Stull?" said the old man. "I'm Enoch Bullripple, and if I'm not a good deal mistaken your father had a farm that he used to come out to in summer-time that was pretty nigh where I lived, which is a couple of miles from Cherry Bridge."

Miss Stull, who at first had been a little shocked at being addressed by a stranger, now smiled and answered: "Oh, yes, I remember you very well, although I never saw you before dressed in this way. You always wore a straw hat, and went about in your shirt sleeves. And you would never let us walk across your big grass field."

"It wasn't on account of your hurtin' the grass," said Mr. Bullripple, "for you couldn't do that, but I don't like to see young gals in pastur' fields where there's ugly cattle. I hope you don't bear me no grudge for keepin' you out of danger."

"Oh, no," said Miss Stull. "In fact I'm much obliged to you."

When John People looked over the desk and saw his uncle talking to Miss Stull, he turned pale. This was a bond of union he had not imagined possible. He felt that his duty called upon him to protest, but when he saw the young lady entering into the conversation with apparent willingness he made no motion to interfere, but stood staring at the two with such wide-eyed earnestness that a gentleman coming up to pay his bill had to rap twice on the desk before he gained John's attention.

"How's your father?" said Mr. Bullripple.

Miss Stull replied that he was quite well, and the other continued: "That's my sister's son over there, behind the desk. He pretty much runs this place as far as I can make out, for whenever I come here I never see nothin' of Vatoldi, who must do his work in the kitchen if he does any. John's mother used to have the farm that your father owned afterwards, and he was born there. But I guess you don't know nothin' about all that."

"Was that young man born at our farm?" said Miss Stull, looking over towards John with the first glance of interest she had ever bestowed upon him.

"Yes, that's where he was born," said Mr. Bullripple; "but he lived with me when you was out there, and his mother, too, which she does yet; and I wish John could get a chance to come out there sometimes for a little country air. But Vatoldi keeps him screwed tight to his work, and it's only now and then of a Sunday that we get sight of him, unless we come to town ourselves."

"That is very mean of Vatoldi," said Miss

Stull, rising, "for I am sure everybody ought to have a holiday now and then. Good-morning, Mr. Bullripple."

As Miss Stull advanced towards the desk John People knew that she was going to speak to him. He felt this knowledge coming hot up into his cheeks, tingling among the resignation lines on his brow, and running like threads of electricity down his back and into his very knees, which did not seem to give him their usual stout and unyielding support. Whether it was from the manner of her walk, or the steady gaze of her eyes, or the expression of her mouth, that this knowledge came to him, it came correctly, for she had no sooner reached the desk and laid her money and her bill upon it, than she said:

"Your uncle tells me, sir, that you were born on the farm where we used to live, near Cherry Bridge."

"Yes, miss," said John, "I was born there."

"Of course, there is no reason why this should not have been so," said Miss Stull, pushing her money towards John; "but, somehow or other, it seems odd to me. What is your name, please?"

John told her, and as she slowly dropped her change into her pocket-book Miss Stull began to think. Had her father been there he would not have been slow to take her aside and inform her that, for a young lady in her position, with a coupé and pair waiting at the door, it was highly improper to stand and think by the desk in a restaurant, with a person like John People behind it. But Miss Stull was a young woman of a very independent turn of mind. She placed a good value on fashion and form and all that sort of thing, but she did not allow her social position to interfere too much with her own ideas of what was good for her.

"There was an old—lady," she said, presently, "whom I used to see very often, and her name was Mrs. People. I liked her better than your uncle. Was she your mother?"

"Yes," said John, "she is my mother."

"That is very nice," remarked Miss Stull, and with a little nod she said "Good-morning, Mr. People," and went out to her coupé.

John smoothed out the bank-note which she had given him, and on the back of it he wrote "M. S.," and put the day of the month and the year beneath it. He left a space between the two initials so he could put in the middle one when he found out what it was. Then he took a note of the same value from his pocket, and put it in the money drawer, and folding carefully the one he had received from Miss Stull, he placed it tenderly in an inner receptacle of his pocket-book.

II.

MR. BULLRIPPLE returned to Vatoldi's about the middle of the afternoon to have a talk with his nephew, but the young man who had charge of the desk during this period of comparative inactivity told him that Mr. People had gone to the bank.

Mr. Bullripple reflected for a moment.

"Well, then," said he, "I would like to see Mr. Vatoldi."

The young man behind the desk laughed. "There isn't any such person," said he. "That's just the name of the place."

Mr. Bullripple looked at him fixedly. "I'd like to know, then," he said, "who is at the head of this establishment."

"Mr. People is. If you want to sell anything, or if you have got a bill to collect, you must go to him."

Mr. Bullripple was about to whistle, but he restrained himself, his eyes sparkling as he put on his mental brakes. "Well, then," he said, "I suppose I must wait till I can see Mr. People." And, without further words, he left the place.

"I suppose I might have waited," said Enoch Bullripple, as he slowly strode up the street, "but, on the whole, I'd as lief not see John jus' now. No Vatoldi, eh? That's a piece of news I must say!"

Mr. Bullripple did not try again to see his nephew that day. He spent the rest of the afternoon in attending to the business that brought him to the city; and, about eight o'clock, he found himself in one of the uptown cross-streets, walking slowly with a visiting card in his hand, looking for a number that was printed thereon. He discovered it before long, but stopped surprised.

"It looks like a hotel," he said, "but eighty-two is the number. There can't be no mistake about that."

So saying, he mounted the few broad steps which led to the front door, and looked for a bell. The house was one of those large apartment-houses, so popular in New York, but with mansions of this kind the old man was totally unfamiliar. He did not know that it was necessary to touch the button by the side of the doorway; but, while he was peering about, the hall-boy saw him from within, and admitted him. The house was not one of the largest and finest of its class, but its appointments were of a high order. The floor was inlaid with different colored marbles, and the walls and ceiling were handsomely decorated.

"Does Mr. Horace Stratford live here?" asked Mr. Bullripple.

"Yes," said the boy, who was attired in a

neat suit of brown clothes with brass buttons, "fifth floor. There's the elevator."

The old man looked in at the door of the brightly lighted elevator, and then he glanced wistfully at the broad stairway which wound up beside it. But, repeating to himself the words "fifth floor," he entered the elevator. Thereupon a second boy in brown clothes with brass buttons stepped in after him, closed the door, pulled the wire rope, and Enoch Bullripple made his first ascent in a machine of this kind. He did not like it. "I'll come down by the stairs," he said to himself; "that is, if they run up that far." Arrived at the fifth floor, the door was opened, and Enoch gladly stepped out, whereupon the elevator immediately descended to the depths below. To the right of the hall in which he now found himself was a door on which was a small brass plate bearing the name "H. Stratford." On this door Mr. Bullripple knocked with his strong, well-hardened knuckles.

The door was opened by an elderly serving-man, who came very quickly to see who it could be who would knock on the door instead of touching the electric bell-knob. Mr. Stratford was at home, and when the visitor had sent in his name he was, without delay, conducted to a large and handsome room, at the door of which Mr. Stratford met him with extended hand.

"Why, Enoch," he said, "I am glad to see you. How do you do? And how is Mrs. People?"

"Spry as common," said Enoch. And, putting down his hat and umbrella, he seated himself in a large easy-chair which Mr. Stratford pushed towards him, and gazed around.

The floor was covered with rich heavy rugs; furniture of antique beauty and modern luxury stood wherever it could find an inviting place; the walls were hung with water-colors and etchings; here and there appeared a bas-relief or a bit of old tapestry; some bookshelves of various shapes and heights were crowded with volumes in handsome bindings; larger books stood upon the floor; while portfolios of engravings and illustrated books were piled up on a table in one corner of the room; articles of oddity or beauty, picked up by a traveler in his wanderings, were scattered about on mantel-piece or cabinet shelf; a wood fire blazed behind polished andirons and fender; and, near by, a large table held a shaded lamp, some scattered books and journals, a jar of tobacco, and the amber-tipped pipe which Mr. Stratford had just laid down. Through a partly drawn portière, which covered a wide doorway at one side of the room, could be caught a glimpse of another apart-

ment, lighted and bright-walled; and beyond the still open door by which the visitor had entered he saw across the handsome hall, with its polished floor and warm-hued rugs, other doors and glimpses of other rooms. Only the apartment in which he sat was open to view, but at every side there came suggestions of light, color, and extent. Everything was bright, warm, and akin to life and living.

Mr. Bullripple put his broad hands upon his knees and gave his head a little jerk. "Well, this beats me!" he said.

Mr. Stratford laughed. "You seem surprised, Enoch," he said. "What is it that 'beats' you?"

"It isn't the fine things," said the old man, "nor the rooms, without no end to 'em as far as I can see, for, of course, if you've got money enough you can have 'em, but it's the idee that a man, with a top-sawyer palace like this of his own, should come up-country to Mrs. People and me, with our scrubbed floors and hard chairs, and nothin' prettier than a tea company's chromo in our best room."

"Now, come," said Mr. Stratford, "that won't do, Enoch, that won't do. Your house is a very pleasant old farm-house, and I am sure that Mrs. People makes my room as comfortable and as cozy as a fisherman and country stroller should need. And, besides, I don't come to your house for things like these," waving his hand before him as he spoke; "I can buy them with money; but what I get when I come up to your country can't be bought."

"That's true as to part of it," said Mr. Bullripple. "The victuals and the lodgin' you do pay for, but the takin' in as one of us, and the dividing up our family consarns with you, just as free as we quarter a pie and give you one of the pieces, is somethin' that's not for sale neither by me nor Mrs. People. And if you can stand our hard boards and country fixin's after all this king and queen furnitur', we'll be mighty glad to have you keep on comin'. And that's one of the things that brought me here to-night. I wanted to ask you if we was to expect you when the summer shows signs of bein' on hand?"

"Oh, yes," said Mr. Stratford, "I certainly expect to be with you this summer, and as early as usual. Has anybody caught that old trout in the meadow brook?"

"No, sir," said Enoch. "I have seen him already this year, an' he's jes' as smart and knowin' as ever. Now I take you into the family, Mr. Stratford, jus' the same as to that trout as to any of our other consarns. If you ketch him, he's your'n, if I ketch him, he's mine. It'll be fair play between us, and I'll

wait till you come. I wouldn't do more'n that for no man."

"No, I don't believe you would," said Mr. Stratford earnestly.

"There's another thing I want to ask you about," said Enoch, "and I will get through with it as soon as I can, for I don't want to keep you up too late talkin' about my affairs."

"Up too late!" said Mr. Stratford. And he smiled as he looked at the clock.

"I suppose you don't mind," said Mr. Bullripple, "settin' up till ten or eleven, but I do; and so I'll get right at it. What I want to say is about my nephew, John People."

"Your sister's son?" said Mr. Stratford. "Is he still cashier at Vatoldi's?"

"Yes," said Mr. Bullripple. "He's that, and pretty much everythin' besides, as far as I can see. I don't know that he washes the dishes, but I'm sure he sees that it's done. You don't happen to know Vatoldi?"

"No," said Mr. Stratford. "I seldom go there, as the place is generally crowded with ladies about the middle of the day, the only time I would be likely to drop in; and I don't suppose I should ever see the man, if I did go. Is your nephew in any trouble?"

"No," said the other, "he don't seem to be. It's me and his mother that's in the trouble. It's our opinion he works too hard, and gets too little. We like to see him come out to the farm sometimes to take some sniffs of the air he was born in, but he never gets no time for that, and as for makin' money, I'm sure he's not doin' it. Now I thought that perhaps you might know Mr. Vatoldi, and could tell me what sort of man he is, so I could know what sort of ground I'm standin' on when I go to speak to him. Perhaps you might have heard somethin' about him that would help to put me on the right tack?"

Mr. Stratford reflected for a moment before answering. "No," said he, "I know nothing about the man whatever. But let me give you a piece of advice, friend Enoch. If it is considered well to say anything to your nephew's employer about the young man's duties and his pay, let him say it himself. You can talk to him about it, and then let him speak to Vatoldi. It is a bad thing, for all parties, for mothers and uncles to undertake to arrange the business affairs of persons as old as your nephew. He must be twenty-five."

"He's all of that," said Enoch, "and it's time he was doin' better. But I won't trouble you no more about him. Since you don't know Vatoldi, there's nothin' more for us to say about that. I've found out that you're comin' to the farm this summer, and that's enough business for one night, an' pretty nigh bed-time

too." And Mr. Bullripple arose, and took up his hat and umbrella. "Now, I come to think of it," he said, "have you found your hundredth man yet?"

"No," answered Mr. Stratford, with a smile, "I can't say that I have; but I have a fancy that I'm on his track and that I may come up with him before very long."

"I often ketch myself laughin' out loud," said Mr. Bullripple, "an' I hope I won't never do it in church, when I think of your chasin' after that hundredth man. You make a dive at a feller, an' ketch him by the leg, an' hold him up, an' look at him, an' then you say: 'No, he's not the one,' an' drop him, an' go after somebody else. I don't believe you'll ever get him."

"I suppose the idea seems very odd to you, Enoch," said Mr. Stratford, "but when I find my man I'll tell you all about him."

"When they told me downstairs that you lived on the fifth floor," said Mr. Bullripple, as he stepped into the private hall and gazed about him at the tall clock, the antique chairs, the trophy-covered walls, the many-hued glass of the great lantern which hung above him, and the partly curtained doorways here and there, "I had a sort o' pity for you for havin' to lodge up so near the top of the house. But it don't appear to me now that you're in need of pity."

"No," said Mr. Stratford, "not in that regard, at any rate. As I own the whole house I might have had any floor I chose, but this one seemed to suit me better than the others, being high and airy, and yet not quite at the top of the house. There are two floors above me."

"You own this whole house!" exclaimed Mr. Bullripple. "Well, upon my word!" For a moment he stood still, and then he resumed: "I was thinkin', as I was sittin' in there, that I'd get Mrs. People to buy some bits of fancied carpets, and to hang up some more picters an' things about the house. But I guess now we'd better pull up an' take down everything of the sort we've got. I should say that after all this you'd like us better in bare boards than with any sort of fixin's we could rig up."

"Now listen to me, friend Enoch," said Mr. Stratford. "If you and your sister make any changes in that delightful old farm-house which I know so well, I'll get up in the middle of the night and catch your big trout, and never give you a chance to measure or weigh him."

"All right," said old Enoch, with a grin. "I guess you'll find us jes' as you left us."

"Are you not going to take the elevator?" said Mr. Stratford, as his visitor, after

shaking hands with him, stepped briskly towards the stairway.

"No," said the old man, "I like my legs better." And down-stairs he went.

"Now," said Mr. Bullripple to himself, when he was out upon the sidewalk, "I think I'll follow that advice Mr. Stratford give me not to speak to old Vatoldi, for I don't believe there's any such man, but I won't let on to John that I've got any idee of that kind. I'll look into things a little more before I do that."

Horace Stratford returned to his library, his study, or his parlor, whatever one might choose to call the room in which he took his ease, or did his work, as the case might be, and, resuming his seat by the table, he lighted his pipe. He was a man of thirty years, or something more; young enough to do what he pleased, and old enough to think what he pleased. To these two pursuits he devoted his life. Possessed of a fair fortune, he invested nearly the whole of it in this apartment-house, which had been built according to his own ideas, and which yielded him a satisfying income. He was not a foolishly eccentric man, nor a selfish one, but he lived for himself, and in his own way. However, if a time came for him to live for other people, he did so cheerfully, but he always did it in his own way.

There were those who looked upon him as an old bachelor; others thought of him as a good match; and others again considered him as a hard-headed fellow whom it would be very unpleasant to live with. But the latter were persons who had never lived with him.

Horace Stratford was not an idler. He was a man of ideas, and his principal business in life was to work out these ideas, either to please or benefit himself, or for the pleasure or benefit of others.

At present he was engaged in the study of a character, or, it might be better said, in the search for a character. It had come to him, in the course of his reading and thought, that in every hundred books on a kindred subject, in every hundred crimes of a similar kind, in every hundred events of a like nature, and in every hundred men who may come within one's cognizance, there is one book, crime, circumstance, or man, which stands up above and distinct from the rest, preëminent in the fact that no one of the others is or could have been like it.

Horace Stratford's immediate occupation was the discovery of a hundredth man among his present friends and associates. This man, when found, was to be the central figure in a piece of literary work he had in mind. As the tests he applied were severe ones, he already had had several disappointments. No one of

the persons he had selected had been able to maintain against his ninety-nine competitors the position in the regard of the investigator to which he had been temporarily exalted.

Mr. Stratford sat reading and smoking until about ten o'clock, when he was called upon by a young man, in full evening dress, with an overcoat on his arm, and a crush hat in his hand. This gentleman had just descended in the elevator from the seventh, or top, floor; and he had dropped in upon Mr. Stratford for a few minutes' conversation before going out. He was a younger man than Stratford, moderately good-looking, somewhat slight in figure, and a little careworn in expression. His dress was extremely correct, according to the fashion of the day; his collar was very high, and his patent leather boots were observably pointed in the region of the toes.

Stratford was glad to see his visitor. "Will you have a pipe or cigar?" he asked.

"Neither, thank you," said the other. "I have given up smoking."

"Thorne, you astonish me!" exclaimed Stratford. "Do you find it injurious to you?"

"Oh, no," replied Mr. Thorne. "You know I never smoked very much."

"You were the most moderate smoker I ever knew," exclaimed Stratford, "with remarkably good taste in regard to tobacco, and smoking always seemed to give you so much actual pleasure."

"That is all very true," said Mr. Thorne, "but, in thinking of the matter, I have come to the conclusion that a man who goes into the society that I go into should not smoke. A cigar after dinner is sure to leave some scent upon one, and one should not carry that into a lady's drawing-room."

"If I were you," said Stratford, "I'd give up the society rather than the cigar; but I think it is not necessary to do either. I smoke as much as I like and I go into society whenever I please, and I have no reason to believe that I am found objectionable."

"It is the right thing to do," persisted Mr. Thorne. "I came to that conclusion day before yesterday, and gave up smoking from that date, with a box of cigars on my shelf that I had just opened."

Mr. Stratford made no answer, but for a few moments gazed steadily at the fire. If almost any young man of his acquaintance had told him that two days before he had given up smoking, he would have paid little attention to the statement, and would have expected to see that young man in a week or two with a cigar in his mouth. But if Arthur Thorne said he had given up this indulgence he believed that he would never smoke again.

"Going out?" presently remarked Stratford.

"I should think you'd get dreadfully tired of that sort of thing."

"I do," said Mr. Thorne, "but, of course, it has to be done. Have you been buying anything lately?" he said, looking around the room.

"Nothing but experience," said Stratford, "and that is not on exhibition."

Mr. Thorne now put on his overcoat and departed. He had had nothing particular to say to Stratford, and had called merely because he considered it his duty to look in occasionally on his friend.

Mr. Arthur Thorne occupied apartments on the upper floor of this house. His rooms were not so extensive as those of Stratford, nor so richly furnished; but every detail of their appointments had been carefully studied by Thorne, and executed or arranged under his own supervision. The floors were stained a dull red, and upon them were spread Kensington rugs of the most somber green and unimpassioned yellow, mingled here and there with a streak of rusty black. The walls were clay color; some red clay, some yellow clay, and some of an ashen-gray hue, such as you find in very poor sections of the country where farms are cheap. The doors and wood-work were also colored in various shades of mud and clay. At the windows were heavy curtains of sad browns or yellows. Some of his furniture was antique, consisting of pieces which he had "picked up" after long and anxious searches. But much of it was modern, and invariably of that class in which the construction is plainly visible. He had a large rocking-chair, the back formed of narrow rods and the bottom of a polished board. Other chairs stood up, as strong, as right-angled, and as hard as the character of the Puritans who used the chairs from which these were copied. On his mantel-piece stood a vase of white roses which had been dead a month or more, but which were kept with great care, because Mr. Thorne knew that there was a certain harmony in their tones which they had never possessed while living. There were etchings on the walls, most of them tacked up without frames, and some with a loose corner carefully curled, so as to give the appearance of conventional ease. There were Japanese fans, but all of a subdued tone, and over the corners of pictures and by the sides of shelves hung pieces of drapery, all of them suggesting the idea that they had once been used by Arabs, and had never since been washed.

Along one side of the room was a row of book-shelves, to which easy access could be had by getting down on one's knees. These shelves were mostly filled with courses of

reading, many of which Mr. Thorne had begun, and some were nearly finished. His apartments consisted of several rooms, and throughout all of these, one perceived the same harmony of tone. Nowhere was there a single touch or point of bright color to break in upon the lugubrious unison of the saddened hues which Mr. Thorne believed to be demanded by true art.

Unless it happened to be very cold or stormy, Mr. Thorne walked every morning to his office, a distance of some three miles, wearing no overcoat, and carrying a heavy cane in his hand. He was not a very strong man, and this morning exercise frequently interfered with that freshness of mind and body with which he liked to apply himself to his work, but he knew it was the right kind of thing to do, and he did it. On certain afternoons in the week he hired a horse and rode in the Park; and this he did with a serious earnestness which showed that he was conscientiously endeavoring to do his duty by his physical 'self. Abstractly he cared little for dancing, preferring much a partner on a chair by his side to whom he could quietly talk; but he had devoted a great deal of attention and hard work to the study of the "german," believing that a knowledge of that complicated dance was essential to the education of a gentleman of his age and position in society.

To the requirements of what he believed to be the spirit of the nineteenth century, Arthur Thorne gave zealous heed. He was fond of novels and the ballads of Macaulay, but he read Spencer and Huxley and Ruskin, and was a steady student of Rossetti and Browning. The Proper, in his eyes, was a powerful policeman, leading by the collar a weeping urchin, who represented the personal inclinations of Arthur Thorne.

There were times when Mr. Stratford believed that he would yet find his hundredth man in Enoch Bullripple or in Arthur Thorne. "Neither of them," he said to himself, "has yet done anything which entitles him to pre-eminence among his fellows, but I believe they possess qualities which, under favoring circumstances, would send one or the other of them to that unique position, which becomes every day more interesting to me."

III.

THE village of Cherry Bridge was little more than a hamlet, lying on the banks of Cherry Creek, which came down from the mountains some five or six miles behind the village, and twisted itself, often very picturesquely, between the hills and through the

woodlands of the lower country. Three miles from the village, between the creek and the mountain, lay the farm of Enoch Bullripple; and about four o'clock on the afternoon of a June day, Mr. Horace Stratford stood on the farm-house porch, with Mrs. People, Enoch's sister, by his side. He had arrived at the place the day before, and was now going out for his first drive. His horse, a large, well-formed chestnut, with good roadster blood in him, stood near the porch, harnessed to a comfortable vehicle for two persons. This was, apparently, an ordinary buggy, but had been constructed, with a number of improvements of Mr. Stratford's own designing, for use on the diversified surface of the country about Cherry Bridge. The equipage had been sent from the city a day or two before, but this was the first time Mrs. People had seen it in its entirety, and she gazed at it with much interest.

Mrs. People was a pleasant-faced personage of about forty-five, whose growth had seemed to incline rather more towards circumference than altitude. She was dressed neatly, but with a decided leaning towards ease in the arrangement of her garments.

"That's a better horse than you had last year, Mr. Stratford," she said; "and I expect you'll get tired of a day's driving as soon as he does. He stands well without hitchin' too; but you'd better take a tie-strap along with you to-day, for Mrs. Justin has got one of them little dust-brush dogs that seems to have been born with a spite against horses. She brought him from town with her, and he even started old Janet when I drove there last Saturday."

"Why do you think I am going to Mrs. Justin's?" asked Mr. Stratford.

"Goodness!" exclaimed Mrs. People, suddenly turning the plenitude of her countenance upon him, "you don't mean to say that you've quarreled?"

"Of course not," answered Mr. Stratford, "but it seems odd that you should take it as a matter of course that I should go there the first time I drive out."

"I'm sure I never thought of anything else," said Mrs. People; "and besides, you'll be obliged to go because I told her you were comin'. I was at the store in the village yesterday mornin', when she drove up, and says I to her, 'Mrs. Justin, you'll have another visitor to-morrow, for Mr. Stratford sent up his horse and buggy yesterday, and he'll be here himself to-night, and he'll drive over to your house to-morrow afternoon. I'm not dead sure that he won't come in the mornin', but I don't think he will, because the afternoon is his time for goin' to see people, and

not disturbin' 'em before dinner when they're busy with their own concerns.' So, you see, she'll be expectin' you, Mr. Stratford. And, knowin' that, I never doubted you'd go."

Mr. Stratford smiled. "I shall certainly go now, Mrs. People," he said, "even if I had not intended to go before. But what did you mean when you said that Mrs. Justin would have another visitor?"

"I meant, she's got two now. They was in the carriage with her. One was a young girl, not twenty, I should say, settin' on the back seat with her. The other was a gentleman of some kind; young, I think, but I couldn't see him very well, havin' his back turned to me, lookin' at Mr. Pritchett with the hind wheel of his hay-wagon broke and a rail tied under. From the way his back moved I think he wanted to tell Mr. Pritchett what to do, but he didn't, and Mrs. Justin she said she'd be glad to see you mornin' or afternoon. And then that hare-lipped young man that David Betts has hired to help him in his store came out to get her orders, and I left without bein' made acquainted with her company, for, of all things, I think its the meanest to stop and listen to what your neighbor is orderin' at the store, and then go about wonderin' why they don't order more of one thing, and get it cheaper, or go without some other thing, or else make it themselves at home, which, ten to one, they couldn't, not knowin' how, and even if they did know, it would cost 'em more to make it than buy it, they knowin' their own business, anyhow, better'n anybody else."

"Well," said Mr. Stratford, going down the porch steps, "I am not sure that I am glad to hear that Mrs. Justin has strangers with her; and I shall remember what you said, Mrs. People, about tying my horse."

Mrs. Justin owned the only house in the region of Cherry Bridge which could rightly be termed a country mansion. It was spacious and handsome, surrounded by well-kept grounds, gardens, and great trees, and the prettiest part of Cherry Creek, or, as Mrs. Justin always persisted in calling it, Cherry River, flowed tranquilly at the bottom of the lawn. A mile away on the other side of the creek lay the farm on which John People was born, and which now belonged to Mr. Stull. The house had been remodeled and enlarged, but the Stull family had ceased to come there in the summer-time. The constantly increasing elevation of their social position rendered the fashionable watering-places much more suitable summer residences than this out-of-the-way country place, which was now leased to a farmer.

Mrs. Justin had no neighbors on whom she could depend for social intercourse. There

was a clergyman at the railroad town, eight miles away, and a doctor's family in the village, and she saw a good deal of Mr. Stratford, who usually spent a portion of his summer at the Bullripple farm. But when Mrs. Justin wanted company, she invited her friends to her house, and thus, during her residence in this summer home, she held the reins of her social relations in her own hands. She came here every year because she loved the place for its own sake, and because it was the home in which her late husband had taken such pride and delight. This husband, a good deal older than Mrs. Justin, had died some four years ago; and, although the world was now obliged to look upon Mrs. Justin as a widow, she did not consider herself in that light. To her it was as if she had married again—married the memory of her husband—and to this memory she was as constant as she had been to the man himself. She was still young and charming to look upon, and there had been those who had ventured to hint at the possibility that she might marry again, but the freezing sternness with which the slightest of these hints had been received had warned all who wished to continue to be her friends not to put their feet upon her sacred ground. There was not a man who knew her well enough to like her well, who now would have dared to tell her he loved her any more than he would have dared to tell her so during the lifetime of her husband.

Mrs. Justin had her life-work, in which she took a warm and enduring interest. The object of her thought and labor, especially during that part of the year which she spent in the city, was the higher education of woman; and her plans for carrying out this purpose were very effectual, but of a simple and quiet nature. She belonged to a society which did not have for its object the establishment of colleges or similar institutions for young women, but aimed solely to assist, in the most private and unobtrusive way, those who wished to enjoy the advantages of such institutions as already existed, and were not able to do so. Many a girl who had gone through college with high honors would never have been able to touch the hem of a freshman's dress had it not been for the unseen but entirely sufficient support afforded by the association of which Mrs. Justin was the head and front.

In this enterprise Horace Stratford had long been a hearty fellow-worker, and many of its best results were due to his interest in its object, and knowledge of men and things. He had known Mrs. Justin's husband, and it was on his account that he had first come into this region; and now, for some years, he had made a home in the Bullripple house,

which stood in the midst of a country which especially suited his summer moods.

Mrs. Justin and Stratford had been sitting on her piazza for about ten minutes when he remarked: "I thought you had visitors here."

"So I have," said Mrs. Justin, "but they have gone for a walk. One of them is Gay Armatt. You remember her, don't you?"

"I remember the name, but not the person."

"You ought to remember her," said Mrs. Justin. "I expect her to be the brightest jewel in my crown, if I ever get one. She is the girl we sent to Astley University, and she has just been graduated ahead of everybody—young men, as well as her sister students."

"What are her strong points?" asked Stratford.

"Mathematics and classics," answered Mrs. Justin, and the present ambition of her life is to continue her studies, and get the degree of Ph.D.; and, knowing her as well as I do, I believe she will succeed."

"I now remember hearing of the girl," said Stratford. "But who is your other visitor?"

"That is Mr. Crisman, to whom Gay is engaged to be married."

"Indeed!" exclaimed Mr. Stratford, "I must say the young lady does not seem to be idling away any of her time. How old is she? And was this man her fellow-student?"

"She is over twenty," said Mrs. Justin; "and Mr. Crisman is not a student at all. He is in business in the city. They have been engaged for more than a year, and will be married next winter. And now, how much more do you want to know? I see by your looks that you are not satisfied."

"I like to know as much as possible about people with whom I am going to associate," said Stratford, "and I cannot help wondering why you have those young persons here."

"Gay's family live in Maryland," said Mrs. Justin, "but I did not want her to go down there this summer. I think her relatives have an idea that she has studied enough, and I am afraid of their influence upon her. Here she will have every opportunity to work as much as any one ought to in the summer-time; and I flatter myself that my influence will be good for her. I believe that Gay has an exceptionally fine future before her, and I don't intend to drop her until I see her enter upon it. And I couldn't invite her here without asking Mr. Crisman to come and spend his Sundays with her, and his vacation, when he gets it, which will be in August, I think. He would have done all that if she had gone to Maryland."

"But haven't you any fears," asked Stratford, "that the girl's marriage will be an

effectual extinguisher to this brilliant future that you talk of?"

"Not a bit of it," answered Mrs. Justin warmly. "That has all been settled. Gay and I have talked it over, and we have planned out everything. The marriage is not to interfere in the least with her studies and her future vocation in life. There is no earthly reason why it should, and I shall be very glad to see another proof in support of the fact that a woman need not remain a spinster in order to become eminent in art, science, or anything else. Here they are now." And the young couple coming up the steps of the piazza, Mr. Stratford was made acquainted with them.

After a few minutes' conversation Miss Armatt and her companion went into the house; and Mr. Stratford, as he arose to take leave of Mrs. Justin, remarked: "Did I understand you to say that girl is over twenty? She doesn't look it."

"She was nearly seventeen when I first met her, four years ago," said Mrs. Justin, "and she was then better grounded in mathematics than most students of twenty. How do you like her?"

"As far as looks go I think she is charming," said Mr. Stratford.

"And you will like her just as much in every other way," said Mrs. Justin, as she shook hands with him. "Don't forget that you are to dine with us to-morrow."

Mrs. Justin's country dinner-hour was three o'clock; and after that meal was over the next day, Stratford and Mr. Crisman sat together for an hour, smoking and talking. Mr. Crisman did most of the talking, and he told his companion a great deal about himself and his business, and also stated a good many opinions he had formed in regard to the public questions of the day. Mr. Stratford did not say much, but he smoked very steadily, and was an admirable listener.

"Well," said Crisman, when, at last, he rose and whisked away with his handkerchief some fallen ashes from his coat, "I am going to look up Miss Armatt, and see if we can't have a row on that little river, as Mrs. Justin calls it, although I should say it would have to grow a great deal before it would have a right to that name. I have got to make the most of my time, you know, as I start back to town early to-morrow morning."

"You will find the navigation of the creek rather difficult," said Mr. Stratford, "until you understand its windings and its shallows."

"Oh, I don't mind that sort of thing!" exclaimed Crisman. "If we stick fast anywhere, I'll roll up my trousers, jump out, and push her off. I'm used to roughing it."

Stratford said no more, but he noticed that shortly afterwards Miss Armatt and her *fiancé* started for a stroll in the woods, and did not go upon the water.

Early on the Monday Mr. Crisman went away to resume his weekly business career in the city; and on Tuesday morning Mr. Stratford found himself again at Mrs. Justin's house. He came this time on business, as the lady wished to consult him in regard to some plans she was making for future work. Miss Gay, being left to her own companionship, concluded to take a walk along the shaded banks of Cherry River. There was no doubt in her mind as to the propriety of this designation. Her affection for Mrs. Justin was so warm that if that lady had called the little stream a lake, Gay Armatt would have thought of it only as Cherry Lake.

No one who did not know Miss Gay, and who now saw her strolling by the waterside, would have connected her in his mind with differential calculus or Sophocles in the original. In coloring she somewhat resembled Mrs. Justin, having light hair and dark eyes, but there the similarity ceased, for one was somewhat tall, with the grace of a woman, and the other was somewhat short, with the grace of a girl.

Miss Gay was in a very cheery mood, as she slowly made her way under the trees and the sometimes too familiarly bending bushes which bordered the banks of the stream; and stopping now and then in some open space, where the glorious sun of June sprinkled his gold on the leaves and the water, and filled the petals of the wild flowers that moved their fragile stems in the gentle breeze with a warm purple light. She had a secret this morning; it was not much of a secret, but it was too much for her to keep to herself; she must tell it to some one or something. A little bird sat on the twig of a tree, which still swayed on account of the youthful haste with which he had alighted upon it. Gay stood still, and looked at him.

"Little bird," she said, "I will tell you my secret. I must tell it to somebody, and I know it will be safe with you. This is my birthday, and I am twenty-one years old. I wouldn't tell Mrs. Justin because she would have been sure to make me a present, or do something for me on account of the day, and she has done so much for me already that I wouldn't have her do that. But I can tell you, little bird, and be quite sure that you won't think that I expect you to give me anything."

The little bird bobbed his head around and looked at her with one eye; then he bobbed it again and looked at her with the other; after which he fluffed up his breast-feathers with an air as though he would say:

"So old as that! I am sure you don't look it!" And then he pressed his feathers down over the secret and flew away.

Miss Gay walked on. "This is the most charming birthday I ever had," she said. "I think it is because I feel so free, and so glad that I have got through with all that hard study. And now I am going to breathe a little before I begin again, and I want every one of you to know — birds over there on the other side of the river, butterflies on the bank, and dragon-flies skimming about over the surface of the water, yes, and even the fish which I can see whisking themselves around down there, and you, whatever you were who flopped into the water just ahead of me without letting me see you, as if I would hurt you, you foolish thing — I want you all to know what a charming thing it is to breathe a little before you begin again; though I don't believe any of you ever do begin again, but just keep on always with what you have to do."

And so she walked on until the stream made a sudden bend to the left, and then she took a path which led through the trees to the right, into the open fields, where she strolled over the grass and by the hedgerows, inhaling, as she went, all the tender odors of the youth of summer. Her course now turned towards the house and the farm buildings; and after clambering over a rail fence she soon saw before her a large barn-yard, in the midst of which stood a towering straw-stack, glistening in the sun. Unlatching the wide gate, she entered the yard, and stood upon the clean straw which had been spread over its surface, gazing upon the stack.

This little mountain of wheat-stalks had probably stood there all winter, but fresh straw from the barn had recently been thrown out upon it, and it looked as sweet and clean and bright as though it had just been piled up fresh from the harvest field.

Then spoke up the happy soul of the girl, and said to her: "What a perfectly lovely straw-stack for a slide!" It had been years since Gay had slid down a stack, but all the joys of those rapturous descents came back to her as she stood and gazed. Then her eyes began to sparkle, and the longings of youth held out their arms, and drew her towards the stack.

She looked here, and she looked there, she looked towards the barn; all the windows and doors were closed. She looked towards the fields and the house; not a person was in sight. Not a living creature did she see, save two gray pullets scratching in a corner of the yard. It is not an easy thing to climb the

slippery sides of a straw-stack, but Gay had once been proficient in that art, and her hands and feet had not lost their cunning. There was some difficult scrambling and some retrogressions, but she was full of vigor and strong intent, and she soon stood upon the summit, her cheeks and lips in fullest bloom, and her whole body beating with the warm pride of success. Her hat had fallen off in the ascent, but she tossed back her ruffled hair, and thought nothing of this mishap. She looked up to the blue sky, and out upon the green fields, and then down upon the smooth sides of the stack, which sloped beneath her.

Now a little cloud spread itself over her countenance. "Gabriella Armatt," she said to herself, "is it proper for you to slide down this stack? That was all very well when you were a girl, but think of it now." Then she thought for a moment, and the cloud passed away, and she spoke for herself: "Yes, I am really and truly a girl yet," she said, "this is my birthday and only the morning of it; I shall never have such a chance as this again, and I oughtn't to take it if it comes. Yes, I will have one slide down this stack! And that will be the very end of my existence as a girl!"

Mrs. Justin and Mr. Stratford had finished their business and were walking across the lawn towards the barn. Suddenly Stratford stopped as they were passing under the shade of a wide-spreading tree.

"Is that Miss Armatt on the top of that straw-stack?" he asked.

Mrs. Justin also stopped. "Why, surely, it is!" she said. "And how in the world did she get up there?"

"Climbed up, I suppose," said Mr. Stratford, "after the fashion of boys and girls. Doesn't she look charming standing up there in the bright sunlight?"

"Her pedestal is too insecure," said Mrs. Justin. "If she steps too much to one side or the other that straw will give way beneath her, and she will have a fall."

Mrs. Justin was just about to call out in a voice of warning, but she suddenly checked herself. At that moment Miss Gay sat down on the extreme edge of the top of the stack, and then, as a gull makes its swift downward swoop through the clear morning air to the glittering ocean crests, so Gay slid down the long side of that straw-stack from girlhood into womanhood.

As she arrived at the bottom, a mass of pink and white, and tumbled hair, Mrs. Justin ejaculated, "Well!" But Horace Stratford said nothing; and the two walked on.

HOOKER'S APPOINTMENT AND REMOVAL.

BY AN OFFICER WHO OCCUPIED RESPONSIBLE AND CONFIDENTIAL POSITIONS AT THE HEADQUARTERS OF THE ARMY OF THE POTOMAC, AND IN THE WAR DEPARTMENT.

MONUMENT IN THE GETTYSBURG CEMETERY.

him, the cabinet were not shaken in the conclusion that McClellan must not be restored, for the jocund Seward, equally with the patient Lincoln, drew the line at a military dictatorship, such as would be practically implied by a second restoration, under such pressure. But while firm, the authorities were circumspect, and concluded that it would not be prudent to increase the tension between themselves and a possible pretorian camp by sending an outsider to take the command from Burnside. Subject to this conclusion, General Halleck and Secretary Stanton favored the transfer of Rosecrans, for whom McClellan might be expected to pass around a good word to supplement his inherent strength as a repeatedly victorious commander.

The choice being narrowed to the Army of the Potomac, a process of exclusion began.

* I have been told recently, on hearsay testimony, that Sedgwick was sounded and said he ought not to be appointed because he was a McClellan man. I never heard that Sedgwick was ever proposed as successor to Burnside, and I cannot believe it, knowing the *limited* though warm regard of Secretary Stan-

WHEN, after the Mud March that succeeded the disaster of Fredericksburg, General Burnside, in a fit of humiliation, telegraphed to Washington requesting, for the second time, to be relieved, the question of his successor was already being considered as a probability. Though stung by the loud roar that went up for McClellan from the army that had twice met disaster after parting with

Franklin was under a cloud and decidedly out of the question; Sumner had many qualifications, but his age and growing feebleness were beyond remedy; Couch was a possible second, and still more likely third choice, and, briefly, the selection was found to lie among Hooker, Reynolds, and Meade.* The first-named had a strong, popular lead, but General Halleck, backed up by the Secretary of War, contended that there were reasons of an imperative character why he should not be intrusted with an independent command of so high a degree of responsibility. Stress was laid upon the fact that in his dispositions for the attack on Marye's Heights, General Burnside, who could at that time have had no valid motive for jealousy of Hooker, had intrusted him with no important part, although he was present on the field and of equal rank with Sumner and Franklin, to whom the active duties of the battle were assigned. President Lincoln apparently yielded to the views of those in charge of the military department of affairs, and thereupon Halleck confidentially inquired of Reynolds if he was prepared to accept the command. Reynolds replied that he expected to obey all lawful orders coming to his hands, but as the communication seemed to imply the possession of an option in himself, he deemed it his duty to say frankly that he could not accept the command in a voluntary sense, unless a liberty of action should be guaranteed to him considerably beyond any which he had reason to expect. He was thereupon dropped, and the choice further and finally restricted to Hooker and Meade, with the chances a hundred to one in favor of the latter by reason of the fixed conviction of the Secretary of War that the former ought not, in any contingency, to be chosen.

Hooker and Meade were in camp, attending to such military duties as the lull of action gave occasion for, neither having taste nor talent for intrigue, each aware that "something" was afoot, but both supposing that the ferment concerned Hooker and Reynolds, and, pos-

tion for him. Stanton always spoke of Sedgwick as a brave, thorough-going soldier, who staid in camp, gave Washington a wide berth, and did not intrigue against his superiors; but I never heard him attribute to Sedgwick such high qualities for a great command as he imputed to some other officers of that army.

sibly, some third man beyond the lines of the army. But there were men about Hooker who believed in, and hoped to rise with him, and who, at all events, could afford to take the chances of success or failure with him; and these men were rich in personal and external resources of the kinds needed for the combination of political, financial, and social forces to a common end. By their exertions, such influences had been busy for Hooker ever since the recent battle, greatly aided by the unselfish labor of earnest men who believed that Hooker's military reputation (the pugnacious disposition implied in his popular cognomen of "Fighting Joe"), and his freedom from suspicion of undue attachment to the fortunes of General McClellan, pointed him out as the man for the occasion by the unerring processes of natural selection. The attitude and character of the Secretary of War, however, justified nothing but despair until connection was made with a powerful faction which had for its object the elevation of Mr. Chase to the Presidency at the end of Mr. Lincoln's term. Making every allowance for the strength and availability of Mr. Chase, as against Mr. Lincoln or any other civilian candidate, his friends did not conceal from themselves that the conqueror of the rebellion would have the disposal of the next Presidency, and they were on the look-

out for the right military alliance when they came into communication with Hooker's friends and received their explanations, that, if it should be his good fortune to bring the war to a successful close, nothing could possibly induce him to accept other than military honors in recognition of his services. General Hooker thereupon became the candidate of Mr. Chase's friends.

As soon as Burnside's tenure of the command had become a question rather of hours than of days, new efforts were made to win over the Secretary of War, but necessarily without avail, because, apart from any personal considerations that may have had place in his mind, he had certain convictions on the subject of a kind which strong men never abandon when once formed. At this critical moment the needed impulse in the direction of Hooker

was supplied by a person of commanding influence in the councils of the administration, and Mr. Lincoln directed the appointment to be made.

Mr. Stanton's first conclusion was that he should resign; his second, that duty to his chief and the public forbade his doing so; his third, that Hooker must be loyally supported so long as there was the least chance of his doing anything with the army placed in his keeping. This latter resolution he faithfully kept, and General Hooker, who soon had occasion to know the facts connected with his appointment, was both surprised at and touched by the generous conduct of his lately implacable opponent.

Mr. Chase found his situation as sponsor for the new commander embarrassing. As a member of the cabinet he could freely express

BREAKING UP THE UNION CAMP AT FALMOUTH.

his views with reference to any military question coming up for cabinet discussion, or, upon any matter introduced to him by the President he had fair opportunity of making a desired impression; but further than this he could not directly go without disclosing a personal interest inconsistent with his place and duty. Yet the circumstances connected with the appointment of Hooker made it imperatively necessary that the influence of Mr. Chase should be exerted in respect of matters which could not formally come to him for consideration, although, on the other hand, they could not safely be intrusted wholly to the keeping of a suspicious and probably hostile War Department. Fortunately for the perplexed statesman, the influence which had proved sovereign when the balance had hung in suspense between Hooker and Meade was safely

and wholly at his service, and, being again resorted to, provided a *modus vivendi* so long as one was needed. Out of all these anomalies a correspondence resulted between Mr. Chase and General Hooker, the publication of which is historically indispensable to the saying of the final word in respect of the leading events of Mr. Lincoln's administration.

When General Hooker telegraphed to Washington that he had brought his army back to the north side of the river, because he could not find room for it to fight at Chancellorsville, President Lincoln grasped General Halleck and started for the front post-haste. He would likewise have taken the Secretary of War, in his anxiety, but for the obvious indelicacy of the latter's appearance before Hooker at such a moment. Mr. Lincoln went back to Washington that night, enjoining upon Halleck to remain till he knew "everything." Halleck was a keen lawyer, and the reluctant generals and staff-officers had but poor success in stopping anywhere short of the whole truth. When he got back to his post, a conference of the President and Secretary of War with himself was held at the War Department, whereat it was concluded that both the check at Chancellorsville and the retreat were inexcusable, and that Hooker must not be intrusted with the conduct of another battle. Halleck had brought a message from Hooker to the effect that as he had never sought the command he could resign it without embarrassment and would be only too happy if, in the new arrangement, he could have the command of his old division and so keep in active service.

The friends of Mr. Chase considered that the fortunes of their leader were too much bound up with Hooker to permit of the latter's ignominious removal and, although the President had learned much that he did not dream of at the time he parted company with the War Department in the matter of appointing a successor to Burnside, the Treasury faction had grown so powerful that he could not consent to a rupture with it, and a temporizing policy was adopted all around, which General Couch, commander of the Second Corps, all unconsciously, nearly spoiled by contemptuously refusing to serve any longer under Hooker, despite the latter's abject appeal to him not to leave the army.

Mr. Stanton was for having it out with the Chase party at once, and a disposition on the part of Hooker to arrange for a further movement against Lee presenting an opportunity, he caused Halleck, in his character of General-in-Chief, to notify Hooker that he must make no movement, nor changes in the dispositions of his army, without obtaining prior approval from himself. Hooker was greatly annoyed

by the receipt of this relentless dispatch, but he had parted with his freedom of action, and those who had made themselves responsible for him had not yet found a way of letting him go without falling with him. Their dilemma became that of the nation, and so the army lay idle while the campaign season was at its height.

General Lee's invasion of Pennsylvania broke up the nearly intolerable situation, and Hooker's diligent and skillful management of his army rapidly brought matters back to the hopeful state they were in before the late battle. But Mr. Stanton was determined that the deliberate decision of the council of war, held after Halleck's return from the front, should not be set aside, and he was now the master of the situation. Hooker was so full of hope and energy that severe measures had to be resorted to in order to wring from him that tender of resignation deemed to be necessary to enable his supporters at Washington to keep on outward terms with the administration. When it did come, the impending battle was evidently so close at hand that the Secretary of War was seized with the fear that, either by accident or design, the change of command to General Meade would not be effected in time to avoid the very contingency aimed at by the change. At the last moment the President too became alarmed, and there was another conference in the council-room at the Department to settle the means of insuring the transfer.

Duplicate copies of the President's order changing the command were made, authenticated by the signature of the adjutant-general and addressed, severally, to Generals Hooker and Meade. Colonel Hardie, chief of the staff of the Secretary of War and a personal friend of both the officers concerned, was then called into the conference room and directed to start at once for Frederick City and, without disclosing his presence or business, make his way to General Meade and give him to understand that the order for him to assume the command of the army immediately was intended to be as unquestionable and peremptory as any which a soldier could receive. He was then, as the representative of the President, to take General Meade to the headquarters of General Hooker and transfer the command from the latter to the former. Colonel Hardie manifested some reluctance to doing his appointed task in the prescribed manner, but Mr. Stanton sententiously remarked that in this case the manner was of the substance of the matter, to which Mr. Lincoln added that he would take the responsibility upon himself for any wound to the feelings of the two generals, or of the bearer of the order.

MAJOR-GENERAL GEORGE G. MEADE. (FROM A PHOTOGRAPH BY BRADY.)

Colonel Hardie was supplied with passes and orders to facilitate his progress, and with money to buy his way through to his destination if delayed or obstructed on the road. If compelled by the imminency of capture by Stuart's raiders to destroy his papers, and he could still make his way through, he was to deliver verbally the order for the changing of the command and supervise its execution.

Colonel Hardie got safely to Frederick, and by diligent inquiry ascertained the whereabouts of General Meade's headquarters, several miles from town. By some oversight at headquarters, no governor or provost marshal had been appointed for the town, and the streets

and all the roads leading to the camps were thronged with boisterous soldiers, more or less filled with Maryland whisky, and many of them ripe for rudeness or mischief. By liberal use of money he at last obtained a buggy and a driver who knew the roads, but his progress through straggling parties of soldiers and trains of wagons was so slow, and he was so often obliged to appeal to officers to secure passage and safety from one stage to another that the night was far spent when he reached General Meade's headquarters and, after some wrangling, penetrated to his tent.

Meade was asleep, and when awakened was confounded by the sight of an officer from

the War Department standing over him. He afterwards said that, in his semi-stupor, his first thought was that he was to be taken to Washington in arrest, though no reason occurred to him why he should be. When he realized the state of affairs he became much agitated, protesting against being placed in command of an army which was looking towards Reynolds as the successor, if Hooker should be displaced; referring to the personal friendship between Reynolds and himself which would make the President's order an instrument of injustice to both; urging the heaviness of the responsibility so suddenly placed upon him, in presence of the enemy and when he was totally ignorant of the positions and dispositions of the army he was to take in charge; and strenuously objecting to the re-

quirement that he should go to Hooker's headquarters to take over the command without being sent for by the commanding-general as McClellan had sent for Burnside and the latter for Hooker. It was a mental relief to the stern Secretary of War, when General Meade's spontaneous utterances were reported to him, to note that he had uttered no protest against Hooker's being relieved of the command, even in what might almost be called the presence of the enemy. This silence on the part of a man so regardless of himself, so regardless of others, Mr. Stanton accepted as being, in itself, his complete vindication.

After taking Colonel Hardie's opinion, as a professional soldier, that he had no lawful discretion to vary from the orders given, horses and an escort were ordered out and the party proceeded to general headquarters, some miles distant. Hardie undertook to break the news to Hooker, who did not need to be told anything after seeing who his visitors were. It was a bitter moment to all, for Hooker had construed favorably the delay in responding to his tender of resignation, and could not wholly mask the revulsion of feeling. General Butterfield, the chief of staff, between whom and General Meade much coldness existed, was called in, and the four officers set themselves earnestly to work to do the state some service by honestly transferring the command and all that could help to make it available for good. Tension was somewhat eased by Meade's insisting upon being regarded as a guest at headquarters while General Hooker was present, and by his requesting General Butterfield, upon public grounds, not to exercise his privilege of withdrawing with his chief; but Hooker's chagrin and Meade's overstrung nerves made the lengthy but indispensable conference rather trying to the whole party.

When Reynolds heard the news, he dressed himself with scrupulous care and, handsomely attended, rode to headquarters to pay his respects to the new commander. Meade, who looked like a wagon-master in the marching clothes he had hurriedly slipped on when awakened in his tent, understood the motive of the act, and after the exchange of salutations all around, he took Reynolds by the arm, and, leading him aside, told him how surprising, imperative, and unwelcome were the orders he had received; how much he would have preferred the choice to have fallen on Reynolds; how anxious he had been to see Reynolds and tell him these things, and how helpless he should hold himself to be did he not feel that Reynolds would give him the earnest support which he would have given to Reynolds in a like situation. Reynolds

GENERAL MEADE IN THE FIELD. (FROM A PHOTOGRAPH.)

BRIGADIER-GENERAL HENRY J. HUNT,
CHIEF OF ARTILLERY OF THE ARMY OF THE POTOMAC.
(FROM A PHOTOGRAPH BY BRADY.)

answered that, in his opinion, the command had fallen where it belonged, that he was glad that such a weight of responsibility had not come upon him, and that Meade might

count upon the best support he could give him. Meade then communicated to Reynolds all that he had learned from Hooker and Butterfield concerning the movements and positions of the two armies, and hastily concerted with him a plan of coöperation which resulted in the fighting of the battle of Gettysburg upon ground selected by Reynolds.

During the afternoon the consultations were ended and, with the aid of the representative of the War Department, the two generals drew up the orders which were to announce formally the change of command. In the evening, standing in front of the commanding general's tent, General Hooker took leave of the officers, soldiers, and civilians attached to headquarters, and amid many a "God bless you, General!" got into the spring wagon that was to convey him and Colonel Hardie to the railroad station *en route* to Washington. When all was ready for the start, the throng about the vehicle respectfully drew back as Meade approached with uncovered head; the two men took each other by the hand, some words passed between them in a low tone, the wagon moved off, and Meade walked silently into the tent just vacated by his predecessor.

Z.

GENERAL MEADE'S HEADQUARTERS ON THE TANEYTOWN ROAD. (FROM A WAR-TIME PHOTOGRAPH.)

General Meade arrived at Cemetery Hill at one o'clock in the morning of July 2d, and after daylight established his headquarters in a small farm-house on the Taneytown road, little more than an eighth of a mile east of Hancock's line of battle, which was the Union center. In the afternoon of July 2d, headquar-

ters became the center of a heavy artillery fire which caused a scattering of officers and staffs and the headquarters signal corps. During the terrific cannonade which preceded Pickett's charge on July 3d, Meade's headquarters received a still greater storm of shot and shell, with the same result.—EDITOR.

BUFORD'S CAVALRY OPPOSING THE
CONFEDERATE ADVANCE UPON
GETTYSBURG.

THE BATTLE OF THE FIRST DAY AT GETTYSBURG.

BY THE CHIEF OF ARTILLERY OF THE ARMY OF THE POTOMAC.

THE battles of Fredericksburg and Chancellorsville raised the confidence of the Confederate army of Northern Virginia to such a height as to cause its subordinate officers and soldiers to believe that, as opposed to the Army of the Potomac, they were equal to any demand that could be made upon them. Their belief in the superiority of the Southerner to the Northerner as a fighter was no longer, as at the beginning of the war, a mere provincial conceit, for it was now supported by signal successes in the field. On each of these two occasions the Army of the Potomac had been recently reorganized under a new general, presumably abler than his predecessor and possessing the confidence of the War Department, and the results were crowning victories for the Confederates. Yet at Fredericksburg defeat was not owing to any lack of fighting qualities on the part of the Federal soldier, but rather to defective leadership.

At Chancellorsville both qualities were called in question. In none of the previous battles between these armies had the disparity of numbers been so great. The Federal general had taken the initiative, his plan of operations was excellent, and his troops eager for battle. The Confederates could at first oppose but a portion of their inferior force to the attack of greatly superior numbers, and the boast of the Federal commander, that "the Army of Northern Virginia was the legitimate property of the Army of the Potomac," seemed in a fair way to be justified, when at the first contact the advantages already gained were thrown away, and a timid defensive attitude assumed. Lee's bold offensive which followed

immediately on this exhibition of weakness, the consequent rout of a Federal army-corps, and the subsequent retreat of the whole army, a large portion of which had not been engaged, confirmed the exultant Confederates in their conviction — which now became an article of faith — that both in combat and in generalship the superiority of the Southerner was fully established. The Federal soldiers returned to their camps on the northern bank of the Rappahannock, mortified and incensed at finding themselves, through no fault of their own, in the condition of having in an offensive campaign lost a battle without fighting, except when the enemy forced it upon them.

Yet in this battle the Northern soldier fought well. No men could under the circumstances have withstood such a sudden attack as that made by "Stonewall" Jackson on the flank and rear of the Eleventh Corps; but as soon as Jackson encountered troops in condition for action, his pursuit was checked and he was brought to a stand. The panic did not extend beyond the routed corps, nor to all of that, for its artillery and so much of its infantry as could form a proper line did their duty, and the army, far from being "demoralized" by this mishap, simply ridiculed the corps which from its supposed want of vigilance had allowed itself to be surprised in a position in which it could not fight. The surprise itself was not the fault of the troops, and the corps redeemed its reputation in subsequent battles. Both armies were composed in the main of Americans, and there was little more difference between their men than might be found between those of either army at different periods, or under varying circumstances; for

although high bounties had already brought into the Federal ranks an inferior element which swelled the muster rolls and the number of stragglers, "bounty jumping" had not as yet become a regular business.

The morale of the Confederate army was, however, much higher at this time than that of its adversary. It was composed of men not less patriotic, many of whom had gone into the war with reluctance, but who now felt that they were defending their homes. They were by this time nearly all veterans, led by officers having the confidence of their government, which took pains to inspire its soldiers with the same feeling. Their successes were extolled and magnified; their reverses palliated or ignored. Exaggerations as to the relative numbers of the troops had been common enough on both sides, but those indulged in at the South had been

difficulties. The Army of the Potomac was not in favor at the War Department. Rarely, if ever, had it heard a word of official commendation after a success, or of sympathy or encouragement after a defeat. From the very beginning its camps had been filled with imputations and charges against its leaders, who were accused on the streets, by the press, in Congress, and even in the War Department itself, and after victories as well as after defeats, not only of incapacity or misconduct, but sometimes of "disloyalty" to their superiors, civil and military, and even to the cause for which they fought. These accusations were followed or accompanied by frequent changes of commanders of the army, army-corps, and even of divisions. Under such circumstances, but little confidence could be felt by the troops, either in the wisdom of a war office which seemed

to change its favorites with the caprice of a coquette, or in the capacity of new generals who followed each other in such rapid succession. But it is due to that patient and sorely tried army, to say that the spirit of both its officers and men was of the best, and their devotion to

THE LUTHERAN SEMINARY. (THE UPPER PICTURE FROM A WAR-TIME PHOTOGRAPH.)

Both pictures show the seminary as facing the town, and in the right-hand view is seen the Chambersburg Pike. On the first day, Buford, Reynolds, and Howard used the cupola for observations; thereafter it was the chief signal-station and observatory for the Confederates.—EDITOR.

echoed, sometimes suggested, in the North by a portion of the press and people, so that friends and enemies united in inspiring in the Confederate soldier a belief in himself and a contempt for his enemy.

In the Army of the Potomac it was different; the proportion of veterans was much smaller; a cessation of recruiting at the very beginning of active operations, when men were easily obtainable to supply losses in existing regiments, had been followed, as emergencies arose, by new levies for short periods of service, and in new organizations which could not readily be assimilated by older troops. And there were special

duty unconquerable. The army itself had originally been so admirably disciplined and tempered, that there always remained to it a firm self-reliance and a stern sense of duty and of honor that was proof against its many discouragements. In battle it always acquitted itself well, and displayed the highest soldierly qualities, no matter who commanded it nor whence he came. Chambersburg furnishes no exception to this assertion, nor evidence of inferiority of the Northern to the Southern soldier, but it does furnish striking illustrations of Napoleon's well-known saying, "In war *men* are nothing, *a man* is everything."

GENERAL LEE'S HEADQUARTERS ON THE CHAMBERSBURG PIKE.
(FROM A WAR-TIME PHOTOGRAPH.)

This dwelling, which stands on the Chambersburg Pike where it crosses Seminary ridge, is called Lee's headquarters; the tents of the Confederate general were pitched in the yard behind the house.—EDITOR.

General Lee, who felt great confidence in his own troops, and overrated the effects of successive reverses on the Federal soldiers, now resolved to assume the offensive, for he knew that to remain on the defensive would in the end force him back on Richmond. He determined, therefore, in case the Army of the Potomac could not be brought to action under favorable circumstances in Virginia, to transfer, if permitted, the field of operations to Northern soil, where a victory promptly followed up would give him possession of Baltimore or Washington, and perhaps lead to the recognition of the Confederacy by foreign powers. The valley of the Shenandoah offered a safe line of operations; the Federal troops occupying it were rather a bait than an obstacle, and to capture or destroy them seemed quite practicable to one who controlled absolutely all Confederate troops within the sphere of his operations. The sharp lesson he had administered the previous year had not been heeded by the Federal War Office; an opportunity now offered to repeat it, and he took his measures accordingly. In case his government would not consent to a bolder offensive, he could at least clear the valley of Virginia of the enemy,—a distinct operation, yet a necessary preliminary to an

invasion of the North. This work was assigned to Lieutenant-General Ewell, an able officer, in every way qualified for such an enterprise.

In anticipation of the new campaign, Lee's army was strengthened and reorganized into three army corps* of three divisions each. Each division consisted of four brigades, except Rodes's and Anderson's, which had five each, and Pickett's, which had three at Gettysburg,—in all, thirty-seven infantry brigades. The cavalry were the select troops of the Confederacy. Officers and men had been accustomed all their lives to the use of horses and arms, "and to the very end the best blood in the land rode after Stuart, Hampton, and the Lees." They were now organized as a division, under Major-General

J. E. B. Stuart, consisting of the six brigades of Hampton, Robertson, Fitzhugh Lee, Jenkins, Jones, and W. H. F. Lee, and six batteries of horse-artillery under Major R. F. Beckham. To these should be added Imboden's command, a strong brigade of over two thousand effective horsemen, and a battery of horse-artillery, which had been operating in the mountain country and was now near Staunton, awaiting orders. The

During the withdrawal of the First and Eleventh Corps through the town to Cemetery Hill, there was hard fighting in the college grounds.—EDITOR.

artillery had recently received an excellent organization under its commandant-in-chief, General Pendleton. It consisted, besides the horse-artillery, of fifteen so-called "battalions," each of four batteries, with one lieutenant-colonel and a major. To each army-corps were attached five battalions, one for each division and two as a reserve, the whole under a colonel as chief of artillery. The total number of batteries was sixty-nine, of guns two hundred and eighty-seven, of which thirty were with the cavalry. With few exceptions the batteries were of four guns each. The army was commanded by a full general, each army-corps, except the artillery, by a lieutenant

general and twenty-nine colonels. The average strength of army corps and divisions was about half that of the Confederates, a fact that should be kept in mind, or the terms will be misleading. The cavalry had been raised under disadvantages. Men accustomed to the use of both horses and arms were comparatively few in the North and required training in everything that was necessary to make a trooper. The theater of war was not considered favorable for cavalry, and it was distributed to the various headquarters for escort duty, guards, and orderlies. It was not until 1863 that it was united under General Pleasanton in a corps consisting of three weak

GETTYSBURG FROM OAK HILL. (FROM A PHOTOGRAPH BY TIPTON.)

ant-general, each division by a major-general, each brigade, except two, by brigadier-generals. Nearly all these officers were veterans of proved ability and many had served in the Mexican war.

In the Army of the Potomac the discharge of fifty-eight regiments had reduced its strength since Chancellorsville by twenty-five thousand effectives, partly replaced by five brigades numbering less than twelve thousand men. At the battle of Gettysburg the seven army-corps* consisted of nineteen infantry divisions, seven of which had two brigades, eleven had three, and one had four: in all fifty-one brigades. The army and army-corps were commanded by major-generals; the divisions by three major- and sixteen brigadier-generals, the infantry brigades by twenty-two brigadier-

divisions, Buford's, D. McM. Gregg's, and Duffie's, afterwards consolidated into two, Stahel's cavalry, which joined at Frederick, June 28th, becoming the third division. The corps was then organized as follows: First Division, Buford: brigades, Gamble, Devin, Merritt; Second Division, Gregg: brigades, McIntosh, Huey, J. Irvin Gregg; Third Division, Kilpatrick: brigades, Farnsworth, Custer. The divisions and three of the brigades were commanded by brigadier-generals, the other five brigades by colonels. To the cavalry were attached Robertson's and Tidball's brigades of horse-artillery. Under excellent chiefs and the spirit created by its new organization, the Federal cavalry soon rivaled that of the Confederates.

The field-artillery was in an unsatisfactory Slocum: divisions, A. S. Williams, Geary; artillery, Muhlenberg.

Engineers, commandant-in-chief, G. K. Warren; Engineer brigade, Benham.

Artillery, commandant-in-chief, Hunt; artillery reserve, Tyler: brigades of Ransom, McGilvery, Taft, Huntington, Fitzhugh.

General Headquarters, Chief of Staff Butterfield, Adjutant-General Williams, Inspector-General Schriver, Provost-Marshal General Patrick.—H. J. H.

*First Corps, J. F. Reynolds: divisions, Wadsworth, Robinson, Doubleday; artillery, Wainwright. Second Corps, Hancock: divisions, Caldwell, Gibbon, Alexander Hays; artillery, Hazard. Third Corps, Sickles: divisions, Birney, Humphreys; artillery, Randolph. Fifth Corps, Sykes: divisions, Barnes, Ayres, Crawford; artillery, A. P. Martin. Sixth Corps, Sedgwick: divisions, Wright, Howe, Wheaton; artillery, Tompkins. Eleventh Corps, Howard: divisions, Barlow, Steinwehr, Schurz; artillery, Osborn. Twelfth Corps,

MAJOR-GENERAL JOHN F. REYNOLDS.

(FROM A PHOTOGRAPH BY BRADY.)

condition. The high reputation it had gained in Mexico was followed by the active and persistent hostility of the War Department, which almost immediately dismounted three-fourths of its authorized batteries. Congress in 1853 made special provision for remounting them as schools of instruction for the whole arm, a duty which the War Department on shallow pretexts evaded. Again in 1861, Congress amply provided for the proper organization and command of the artillery in the field, but as there was no chief nor special administration for the arm, and no regulations for its government, its organization control and direction were left to the fancies of the various army commanders. General officers were practically denied it, and in 1862 the War Department announced in orders that field-officers of artillery were an unnecessary expense and their muster into service forbidden. Promotion necessarily ceased, and such brilliant artillerymen as Hays, DeRussy, Getty, Gibbon, Griffin, and Ayres could only receive promotion by transfer to the infantry or cavalry. No adequate measures were taken for the supply of recruits, and the batteries were frequently dependent on the troops to which they were attached for men enough to work their guns in battle. For battery-draft they were often glad to get the refuse horses after the ambulance and quartermasters' trains were supplied. Still, many of the batteries attained a high degree of excellence, due mainly to the self-sacrifice, courage, and intelligence of their own officers and men.

On taking command of the army, General Hooker had transferred the military command of the artillery to his own headquarters, to be resumed by the chief of artillery only under specific orders and for special occasions, which resulted in such mismanagement and confusion at Chancellorsville that he consented to organize the artillery into brigades. This was a decided improvement, which would have been greater if the brigade commanders had held adequate rank. As it was, there was no artillery commandant-in-chief for months before the battle of Gettysburg, and of the fourteen brigades four were commanded by field-officers, nine by captains, and one by a lieutenant, taken from their batteries for the purpose. The number of field batteries at Gettysburg was sixty-five, of guns three hundred and seventy, of which two hundred and twelve were with the infantry, fifty with the cavalry, one hundred and eight in the reserve. The disadvantages under which the artillery labored all through the war, from want of proper regulations, supervision, and command, were simply disgraceful to our army administration from the close of the Mexican to that of the Civil War, and

caused an unnecessary expenditure of both blood and treasure.

It will be perceived by comparison that the organization of the Army of the Potomac was at this period in every way inferior to that of its adversary. The army-corps and divisions were too numerous and too weak. They required too many commanders and staffs, and this imposed unnecessary burdens on the general-in-chief, who was often compelled to

place several army-corps under the commander of one of them, thus reproducing the much abused "grand divisions" of Burnside, under every possible disadvantage. Had the number of infantry corps been reduced to four at most, and the divisions to twelve, the army would have been more manageable and better commanded, and the artillery, without any loss, but rather a gain of efficiency, could have been reduced by a dozen or fifteen batteries.

EARLY in June Lee's army began to move, and by the 8th, Longstreet's and Ewell's corps had joined Stuart's cavalry at Culpeper. A. P. Hill's corps was left in observation at Fredericksburg; and so skillfully were the changes concealed that Hooker, believing that all the enemy's infantry were still near that town, ordered Pleasonton to beat up Stuart's camps at Culpeper, and get information as to the enemy's position and proposed movements. For these purposes he gave

Pleasanton two small brigades of infantry, 3000 men under Generals Ames and Russell, which carried his total force to 10,981. They were echeloned along the railroad which crosses the river at Rappahannock Station, and runs thence ten miles to Culpeper. About midway is Brandy Station, a few hundred yards north of which is Fleetwood Hill. Dividing his force equally, Pleasanton ordered Buford and Ames to cross at Beverly's, and

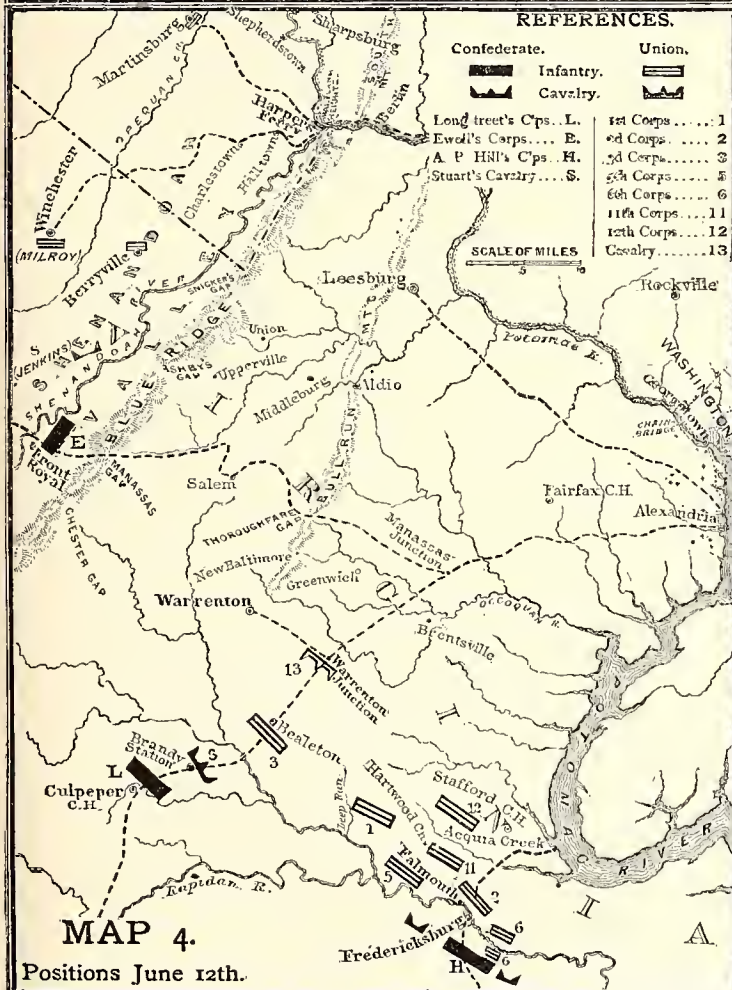

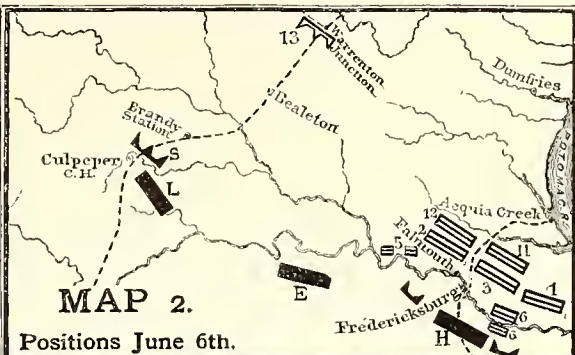

LUTHERAN CHURCH ON CHAMBERSBURG STREET, USED AS A HOSPITAL. (FROM A PHOTOGRAPH BY TIPTON.)

Gregg, Duffié, and Russell at Kelly's Ford. All were to march to Brandy Station, Duffié being thrown out to Stevensburg to watch the Fredericksburg road. Then the whole force was to move on Culpeper. The crossing was ordered for June 9th; but on the 8th, General Lee having sent Jenkins's brigade as Ewell's advance into the valley, reviewed the other five brigades of Stuart, 10,292 combatants, on the plains near Brandy Station. After the review they were distributed in the neighborhood with a view to their crossing the Rappahannock on the 9th, Stuart establishing his headquarters at Fleetwood. Accident had thus disposed his forces in the most favorable manner to meet Pleasanton's converging movements.

At daybreak Buford crossed and drove the enemy's pickets from the ford back to the main body, near St. James's church. Stuart, on the

first report of the crossing, sent Robertson's brigade toward Kelly's to watch that ford, and Colonel M. C. Butler's Second South Carolina to Brandy Station. He himself took the command at the church where he was attacked by Buford. In one of the engagements W. H. F. Lee was wounded, and Colonel Chambliss took command of his brigade. Meantime Gregg had crossed at Kelly's Ford, and, Duffié leading, took a southerly road, by which he missed Robertson's brigade. Learning that Duffié's advance had reached Stevensburg and that Buford was heavily engaged, Gregg pushed direct for Brandy Station, sending orders to Duffié to follow his movement. Stuart, notified of his approach, had sent in haste some artillery and two of Jones's regiments to Fleetwood, and Colonel Butler started at once for Stevensburg, followed soon after by Wickham's Fourth Virginia. On their approach two squadrons of the Sixth Ohio, in occupation of the place, fell back skirmishing. Duffié sent two regiments to their aid, and after a severe action, mainly with the Second South Carolina, reoccupied the village. In this action Colonel Butler lost a leg, and his lieutenant-colonel, Hampton, was killed.

On Gregg's arrival near Brandy Station the enemy appeared to be in large force, with artillery, on and about Fleetwood Hill. He promptly ordered an attack; the hill was carried, and the two regiments sent by Stuart driven back. Buford now attacked vigorously and gained ground steadily, for Stuart had to reënforce his troops at Fleetwood from the church. In the struggles that followed, the hill several times changed masters; but as Duffié did not make his appearance, Gregg was finally overmatched and withdrew, leaving three of his guns, two of them disabled, in the enemy's hands, nearly all of their horses being killed and most of their cannoneers *hors de combat*. There were some demonstrations of pursuit, but the approach of Buford's reserve brigade stopped them. Duffié finally came up and Gregg reported to Pleasanton, informing him of the approach of Confederate infantry from Culpeper. Pleasanton, who had captured some important dispatches and orders, now considered his mission as accomplished, and ordered a withdrawal of his whole command. This was effected leisurely and without molestation. Gregg recrossed at Rappahannock Station, Buford at Beverly's Ford, and at sunset the river again flowed between the opposing forces. Stuart reports his losses at four hundred and eighty-five, of whom three hundred and one were killed or wounded. Pleasanton reports an aggregate loss (exclusive of Duffié's, which would not exceed twenty-five) of nine hundred and seven, of whom

SCALE OF MILES

These maps and the others relating to the campaign and battle of Gettysburg are compilations by Abner Doubleday, Brevet Major-General, U. S. A., from the official reports of the commanders on both sides, and from the maps of Colonel John B. Bachelder, which were purchased by Congress for the War Department.—EDITOR.

four hundred and twenty-one were killed or wounded. In nearly all the previous so-called "cavalry" actions, the troops had fought as dismounted dragoons. This was in the main a true cavalry battle, and enabled the Federals henceforth to dispute the superiority hitherto claimed by, and conceded to, the

Confederate cavalry. In this respect the affair was an important one. It did not, however, delay for a moment General Lee's designs on the valley; he had already sent Imboden by way of Romney toward Cumberland to destroy the railroad and canal from that place to Martinsburg.

UNION DEAD WEST OF THE SEMINARY. (FROM A PHOTOGRAPH.)

Milroy's Federal division, about nine thousand strong, occupied Winchester, with McReynolds's brigade in observation at Berryville. Kelley's division of about ten thousand men was at Harper's Ferry, with a detachment of twelve hundred infantry and a battery under Colonel B. F. Smith at Martinsburg. On the night of June 11th, Milroy received instructions to join Kelley, but, reporting that he could hold Winchester, was authorized to remain there. Ewell, leaving Brandy Station June 10, reached Cedarville via Chester Gap on the evening of the 12th, whence he detached Jenkins and Rodes to capture McReynolds, who, discovering their approach, withdrew to Winchester. They then pushed on to Martinsburg, and on the 14th drove out the garrison. Smith's infantry crossed the Potomac at Shepherdstown, and made its way to Maryland Heights; his artillery retreated by the Williamsport road, was pursued, and lost five guns.

Meanwhile Ewell, with Early's and Edward Johnson's divisions, marched direct on Winchester. Arriving in its neighborhood on the evening of the 13th, he ordered Early on the 14th to leave a brigade in observation on the south of the town, move his main force under cover of the hills to the north-western side, and seize the outworks which commanded the main fort. He also ordered Johnson to deploy his division on the east of the town, so as to divert attention from Early. This was so

successfully done that the latter placed, unperceived, twenty guns and an assaulting column in position, and at 6 P. M., by a sudden attack, carried the outworks, driving the garrisons into the body of the place. This capture was a complete surprise, and Milroy called a council of war, which decided on an immediate retreat, abandoning the artillery and wagons. Ewell had anticipated this, and ordered Johnson to occupy with a brigade a position on the Martinsburg pike, north of Winchester. The retreat commenced at two A. M. of the 15th, and after proceeding three or four miles, the advance encountered Johnson's troops, attacked vigorously, and at first successfully, but the enemy receiving reinforcements, a hard fight ensued in which the Federals lost heavily. The retreat was then continued; the troops separated in the darkness, one portion reaching Harper's Ferry, another crossing the Potomac at Hancock. On the 15th, Ewell crossed the river, occupied Hagerstown and Sharpsburg, and sent Jenkins's cavalry to Chambersburg to collect supplies. On the 17th, the garrison of Harper's Ferry was removed to Maryland Heights, and the valley of the Shenandoah was cleared of Federal troops. In these brilliant operations General Lee claims for Ewell the capture of four thousand prisoners and small arms, twenty-eight pieces of artillery, eleven colors, three hundred loaded wagons, as many horses, and a considerable quantity of stores of all

descriptions, the entire Confederate loss, killed, wounded, and missing, being two hundred and sixty-nine.

These operations indicate on the part of General Lee either contempt for his opponent, or a belief that the chronic terror of the War Department for the safety of Washington could be safely relied upon to paralyze his movements,—or both. On no other reasonable hypothesis can we account for his stretching his army from Fredericksburg to Williamsport, with his enemy concentrated on one flank, and on the shortest road to Richmond.

General Hooker's instructions were to keep always in view the safety of Washington and Harper's Ferry, and this necessarily subordinated his operations to those of the enemy. On June 5th, he reported that in case Lee moved via Culpeper toward the Potomac with his main body, leaving a corps at Fredericksburg, he should consider it his duty to attack the latter, and asked if that would be within the spirit of his instructions. In reply he was warned against such a course, and its dangers to Washington and Harper's Ferry were pointed out. On June 10th, learning that Lee was in motion, and that there were but few troops in Richmond, he proposed an immediate march on that place, from which, after capturing it, he could send the disposable part of his force to any threatened point north of the Potomac, and was informed that Lee's army and not Richmond was his true objective. Had he taken Richmond, Peck's large force at Suffolk and Keyes's ten thousand men in the Peninsula might have

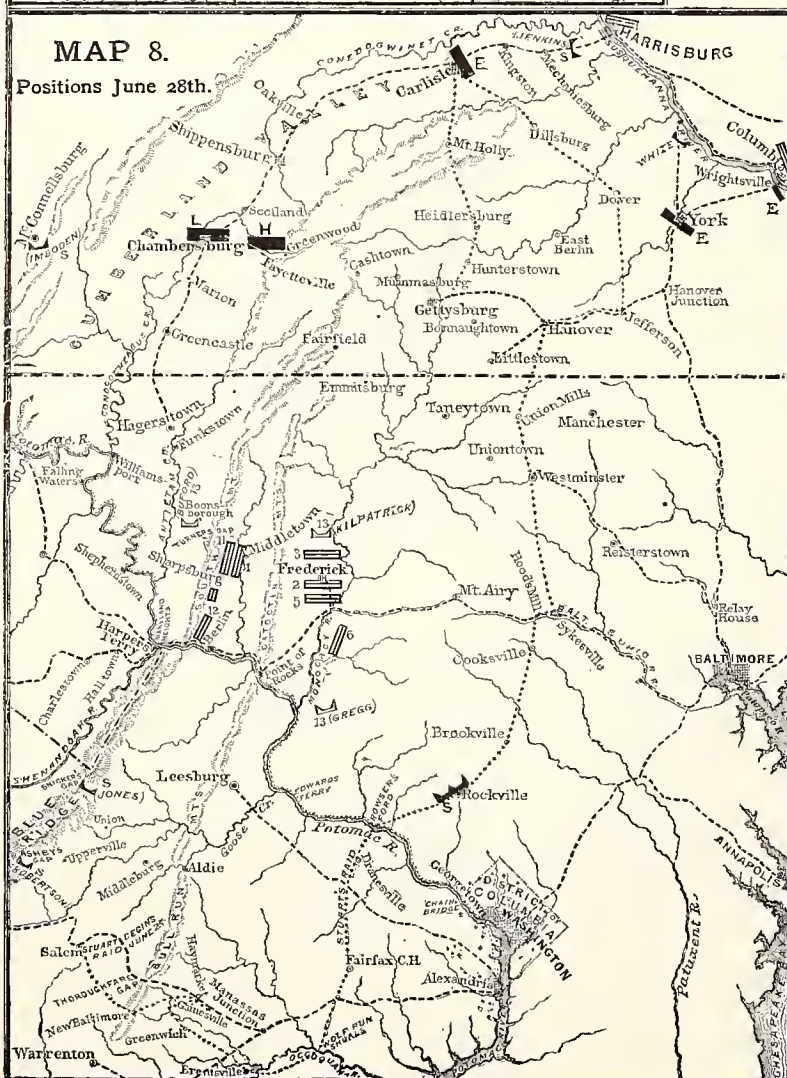

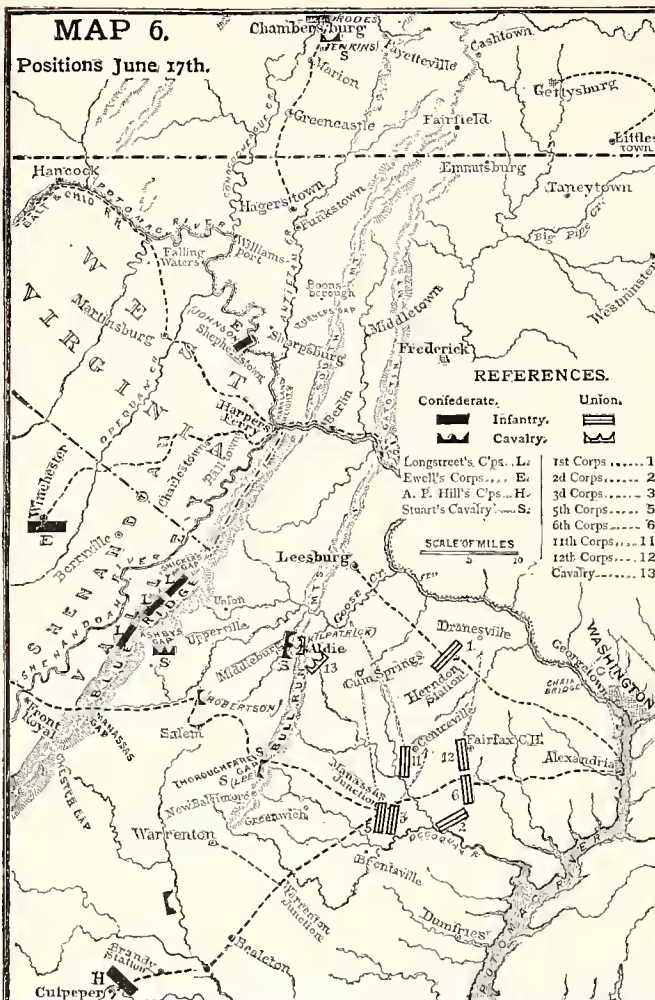

been utilized, and Hooker's whole army set free for operations against Lee.

As yet an invasion of the North had not been definitely fixed upon. On June 8th, the day before Brandy Station, General Lee, in a confidential letter to Mr. Seddon, Confederate Secretary of War, stated that he was aware of the hazard of taking the aggressive, yet nothing was to be gained by remaining on the defensive; still, if the department thought it better to do so, he would adopt that course. Mr. Seddon replied June 10th, the date of Hooker's proposal to march on Richmond, concurring in General Lee's views. He considered aggressive action indispensable, that "all attendant risks and sacrifices must be incurred," and adds, "I have not hesitated in coöperating with your plans to leave this city almost defenseless." General Lee now had full liberty of action, with the assured support of his government,—an immense advantage over an opponent who had neither.

So soon as Hooker learned from Pleasonton that a large infantry force was at Culpeper, he extended his right up the Rappahannock, and when informed of Ewell's move toward the valley, being forbidden to attack A. P. Hill at Fredericksburg or to spoil Lee's plans by marching to Richmond, he moved his army, on the night of June 13th, toward the line of the Orange and Alexandria Railroad, and occupied Thoroughfare Gap in advance of it. On the 15th, Longstreet left Culpeper, keeping east of the Blue Ridge and so covering its gaps. On the 14th, Hill left Fredericksburg, and via Chester Gap reached Shepherds-

UNION DEAD NEAR MCPHERSON'S WOODS. (FROM A PHOTOGRAPH.)

town on the 23d. Stuart's cavalry had been thrown out on Longstreet's right to occupy the passes of the Bull Run mountains and watch Hooker's army. On the 17th, he encountered, near Aldie, a portion of Pleasanton's command; a fierce fight ensued which left the Federals in possession of the field. During the four following days there was a succession of cavalry combats; those of the 19th near Middleburg, and of the 21st near Upperville, were especially well contested, and resulted in the retreat of Stuart through Ashby's Gap. Longstreet had already withdrawn through the gaps and followed Hill to the Potomac. Imboden, his work of destruction completed, had taken post at Hancock. Longstreet and Hill crossed the Potomac on the 24th and 25th and directed their march on Chambersburg and Fayetteville, arriving on the 27th. Stuart had been directed to guard the mountain passes until the Federal army crossed the river, and, according to General Lee's report, "to lose no time in placing his command on the right of our [Confederate] column as soon as he should perceive the enemy moving northward," in order to

watch and report his movements. According to Stuart's report, he was authorized to cross between the Federal army and Washington, and directed after crossing to

proceed with all dispatch to join Early in Pennsylvania.

General Lee so far had been completely successful; his army was exultant, and he lost

no time in availing himself of his advantages. On the 21st he ordered Ewell to take possession of Harrisburg; and on the 22d Ewell's whole corps was on the march, Rodes's and Johnson's divisions via Chambersburg to Carlisle, which they reached on the 27th, and Early via Greenwood and Gettysburg to York, with orders from Ewell to break up the Northern Central Railroad, destroy the bridge across the Susquehanna at Wrightsville, and then rejoin the main body at Carlisle. Early entered York on the 28th, and sent Gordon's brigade, not to destroy, but to secure possession of the bridge, which would enable him to operate upon Harrisburg from the rear; but a small militia force under Colonel Frick, retreating from Wrightsville across the bridge, after an unsuccessful attempt to destroy one of its spans, set fire to and entirely destroyed that fine structure, Gordon's troops giving their aid to the citizens to save the town from the flames. On the 29th, Ewell received orders from General Lee to rejoin the army at Cash-town; the next evening, 30th, his reserve artillery and trains, with Johnson's division as an escort, were near Chambersburg, and Ewell, with Early's, and Rodes's, near Heidlersburg. Thus suddenly ended Ewell's Harrisburg expedition. One object was to collect supplies, and contributions were accordingly levied. Much damage was done to roads and bridges, but the prompt advance of the Army of the Potomac made this useless to the Confederates.

Before committing his army to an invasion of the North, General Lee recommended the proper steps to cover and support it. In a letter of June 23d, addressed to President Davis, he states that the season was so far advanced as to stop further Federal operations on the Southern coast, and that Confederate troops in that country and elsewhere were now disposable. He proposed, therefore, that an army should as soon as possible be organized at Culpeper, as "the well-known anxiety of the Northern Government for the safety of its capital would induce it to retain a large force for its defense, and thus relieve the opposition to our advance"; and suggested that General Beauregard be placed in command, "as his presence would give magnitude even to a small demonstration." On the 25th, he wrote twice to Mr. Davis urging the same views. The proposition embarrassed Mr. Davis, who could not see how, with the few troops under his hand, it could be carried out. In fact, although General Lee had pointed out the means, the proposition came too late, as the decisive battle took place much earlier than was expected. This correspondence, however, with that between General Lee and Mr. Seddon, shows that Hooker's project to

capture Richmond by a *coup-de-main* was feasible.

It was not now a question of "swapping queens." Washington was safe, being well fortified and sufficiently garrisoned, or with available troops within reach, without drawing on Hooker; and to take Richmond and scatter the Confederate Government was the surest way to ruin Lee's army—"his true objective."

On the first appearance of danger of invasion, her vigilant governor, Curtin, warned the people of Pennsylvania, and called out the militia. General Couch was sent to Harrisburg to organize and command them, but disbelief in the danger—due to previous false alarms—caused delays until the fugitives from Milroy's command, followed by Jenkins's cavalry, roused the country. Defensive works were then thrown up at Harrisburg and elsewhere, and local forces were raised and moved toward the enemy.

Early in June, General Hooker represented in strong terms the necessity of having one commander for all the troops whose operations would have an influence on those of Lee's army, and in reply was informed by General Halleck that any movements he might suggest for other commands than his own would be ordered *if practicable*. Misunderstandings and confusion naturally resulted from such an arrangement, and authority was given him from time to time to exercise control over the troops of Heintzelman, commanding the Department of Washington, and of Schenck commanding the Middle Department, followed, June 24th, by orders specifically placing the troops in Harper's Ferry and its vicinity at his disposal.

Disregarding Ewell's movements, Hooker conformed his own to those of the enemy's main body, and crossed the Potomac at Edwards's Ferry on the 25th and 26th of June. On the 27th, three army-corps under Reynolds occupied Middletown and the South Mountain passes. The Twelfth Corps was near Harper's Ferry, and the three other corps at or near Frederick. Hooker now ordered the Twelfth Corps to march early on the 28th to Harper's Ferry, there to be joined by its garrison from Maryland Heights, in order to cut Lee's communications with Virginia, and in conjunction with Reynolds to operate on his rear. General Halleck, however, objected to the abandonment of the Heights, notwithstanding Hooker's representations that the position was utterly useless for any purpose; whereupon Hooker abandoned his project, and finding now that he was "not allowed to manœuvre his own army in the presence of the enemy," asked to be relieved from his command. He had encountered some of the difficulties which

ASSAULT OF BROCKENBROUGH'S CONFEDERATE BRIGADE (HETH'S DIVISION) UPON THE STONE BARN OF THE MCPHERSON FARM.

The line of the stone barn was held by Stone's brigade, Pennsylvania Bucktails (Doubleday's division), its right resting on the Chambersburg pike (the left of the picture) and its left on the

McPherson woods (right background of the picture), where a part of Archer's Confederate brigade of Heth's division was captured by Meredith's brigade.—EDITOR.

had beset a predecessor whom he had himself mercilessly criticised, and promptly succumbed to them. His request was complied with, and Major-General George G. Meade was appointed his successor, this being the fifth change of commanders of the Army of the Potomac in ten months. General Meade was an excellent officer of long service, who had always proved equal to his position, whether as a specialist or a commander of troops. Many welcomed his advent—some regretted Hooker. All thought the time for the change unfortunate, but accepted loyally, as the Army of the Potomac ever did, the leader designated by the President, and gave him their hearty support. He was succeeded in the command of the Fifth Corps by Major-General George Sykes, a veteran of the Mexican war and a distinguished soldier.

When General Meade assumed command, June 28th, the best information placed Longstreet at Chambersburg, A. P. Hill between that place and Cashtown, and Ewell in occupation of Carlisle, York, and the country between them, threatening Harrisburg. Unacquainted with Hooker's plans and views, he determined at once to move on the main line from Frederick to Harrisburg, extending his wings as

far as compatible with a ready concentration, in order to force Lee to battle before he could cross the Susquehanna. With this view he spent the day in ascertaining the position of his army, and brought up his cavalry, Buford to his left, Gregg to his right, and Kilpatrick to the front. Directing French to occupy Frederick with seven thousand men of the garrison of Harper's Ferry, he put his army in motion early on the morning of the 29th. Kilpatrick reached Littlestown that night; and on the morning of the 30th, the rear of his division, while passing through Hanover, was attacked by a portion of Stuart's cavalry. Stuart, availing himself of the discretion allowed him, had left Robertson's and Jones's brigades to guard the passes of the Blue Ridge, and on the night of the 24th, with those of Hampton, Fitzhugh Lee and Chambliss, had started to move round the Army of the Potomac, pass between it and Centreville into Maryland, and so rejoin Lee; but the movements of that army forced him so far east that he was compelled to ford the Potomac near Seneca, on the night of the 27th. Next morning, learning that Hooker had already crossed the river, he marched north by Rockville, where he captured a wagon train. Paroling

his prisoners and taking the train with him, he pushed on—through Westminster, where he had a sharp action with a squadron of Delaware horse—to Union Mills, and encamped there on the 29th. During the night, he learned that the Federal army was still between him and Lee on its march north, and his scouts reported its cavalry in strong force at Littlestown, barring his direct road to Gettysburg; wherefore, on the morning of the 30th he moved across country to Hanover, Chambliss in front and Hampton in rear of his long train of two hundred wagons, with Fitzhugh Lee well out on his left flank. About 10 A. M. Chambliss, reaching Hanover, found Kilpatrick passing through the town and attacked him, but was driven out before Hampton or Lee could come to his support. Stuart's men and horses were now nearly worn out; he was encumbered with a large captured train; a junction with some part of Lee's army was a necessity, and he made a night march for York, only to learn that Early had left the day before. Pushing on to Carlisle, he found that Ewell was gone, and the place occupied by a militia force under General W. F. Smith. His demand of a surrender was refused, upon which he threw a few shells into the town and burned the Government barracks.

That night he learned that Lee's army was concentrating at Gettysburg, and left for that place next day. Thus ended a "raid" which greatly embarrassed General Lee, and by which the services of three fine cavalry brigades were, in the critical period of the campaign, exchanged for a few hundred prisoners and a wagon train.

Hearing nothing from Stuart, and therefore believing that Hooker was still south of the Potomac, Lee, on the afternoon of the 28th, ordered Longstreet and Hill to join Ewell at Harrisburg; but late that night one of Longstreet's scouts came in and reported that the Federal army had crossed the river, that Meade had relieved Hooker and was at Frederick. Lee thereupon changed the rendezvous of his army to Cashtown, which place Heth reached on the 29th, and next day sent Pettigrew's brigade on to Gettysburg, nine miles, to procure a supply of shoes. Nearing this place, Pettigrew discovered the advance of a large Federal force and returned to Cashtown. Hill immediately notified Generals Lee and Ewell, informing the latter that he would advance next morning on Gettysburg. Buford, sending Merritt's brigade to Mechanicstown as guard to his trains, had early on the morning of the 29th crossed into and moved up the Cumberland valley via Boonsboro' and Fairfield with those of Gamble and Devin, and on the afternoon of

Tuesday, June 30th, under instructions from Pleasonton, entered Gettysburg, Pettigrew's brigade withdrawing on his approach.

From Gettysburg, near the eastern base of the Green Ridge, and covering all the upper passes into the Cumberland valley, good roads lead to all important points between the Susquehanna and the Potomac. It is therefore an important strategic position. On the west of the town, distant nearly half a mile, there is a somewhat elevated ridge running north and south, on which stands the "Lutheran Seminary." It is covered with open woods through its whole length, and is terminated nearly a mile and a half north of the seminary by a commanding knoll, bare on its southern side, called Oak Hill. From this ridge the ground slopes gradually to the west, and again rising forms another ridge about five hundred yards from the first, upon which, nearly opposite the seminary, stands McPherson's farm buildings. This second ridge is wider, smoother, and lower than the first, and Oak Hill, their intersection, has a clear view of the slopes of both ridges and of the valley between them. West of McPherson's ridge Willoughby Run flows south into Marsh Creek. South of the farm buildings and directly opposite the seminary, a wood borders the run for about three hundred yards, and stretches back to the summit of McPherson's ridge. From the town two roads run; one south-west to Hagerstown via Fairfield, the other north-westerly to Chambersburg via Cashtown. The seminary is midway between them, about three hundred yards from each. Parallel to, and one hundred and fifty yards north of the Chambersburg pike, is the bed of an unfinished railroad, with deep cuttings through the two ridges. Directly north of the town the country is comparatively flat and open; on the east of it, Rock Creek flows south. On the south, and overlooking it, is a ridge of bold, high grounds, terminated on the west by Cemetery Hill and on the east by Culp's Hill, which, bending to the south, extends half a mile or more and terminates in low grounds near Spangler's Spring. Culp's Hill is steep toward the east, is well wooded, and its eastern base is washed by Rock Creek.

Impressed by the importance of the position, Buford, expecting the early return of the enemy in force, assigned to Devin's brigade the country north, and to Gamble's that west of the town; sent out scouting parties on all the roads to collect information, and reported the condition of affairs to Reynolds. His pickets extended from below the Fairfield road, along the eastern bank of Willoughby Run, to the railroad cut, then easterly some fifteen hundred yards north of the town, to a wooded hillock near Rock Creek.

ing the general line of Pipe Creek as a suitable locality. Carefully drawn instructions were sent to the corps commanders as to the occupation of this line, should it be ordered; but it was added that developments might cause the offensive to be assumed from present positions. These orders were afterward cited as indicating General Meade's intention not to fight at Gettysburg. They were, under any circumstances, wise and proper orders, and it would probably have been better had he concentrated his army behind Pipe Creek

On the night of June 30th Meade's headquarters and the Reserve artillery were at Taneytown; the First Corps at Marsh Run, the Eleventh at Emmettsburg, Third at Bridgeport, Twelfth at Littlestown, Second at Uniontown, Fifth at Union Mills, Sixth and Gregg's cavalry at Manchester, Kilpatrick's at Hanover. A glance at the map (page 123) will show at what disadvantage Meade's army was now placed. Lee's whole army was nearing Gettysburg, whilst that of Meade was scattered over a wide extent of country to the east and south of that town.

Meade was now convinced that all designs on the Susquehanna had been abandoned; but as Lee's corps were reported as occupying the country from Chambersburg to Carlisle, he ordered for the next day's moves, the First and Eleventh Corps to Gettysburg, under Reynolds, the Third to Emmettsburg, Second to Taneytown, Fifth to Hanover, and the Twelfth to Two Taverns, directing Slocum to take command of the Fifth in addition to his own. The Sixth Corps was left at Manchester, thirty-four miles from Gettysburg, to await orders. But Meade, while conforming to the current of Lee's movement, was not merely drifting. That same afternoon he directed the chiefs of engineers and artillery to select a field of battle on which his army might be concentrated, whatever Lee's lines of approach, whether by Harrisburg or Gettysburg, indicat-

rather than at Gettysburg; but events finally controlled the actions of both leaders.

At 8 A. M., July 1st, Buford's scouts reported Heth's advance on the Cashtown road, when Gamble's brigade formed on McPherson's Ridge, from the Fairfield road to the railroad cut; one section of Calef's battery A, Second United States, near the left of his line, the other two across the Chambersburg or Cashtown pike. Devin formed his disposable squadrons from Gamble's right toward Oak Hill, from which he had afterward to transfer them to the north of the town to meet Ewell. As Heth advanced, he threw Archer's brigade to the right, Davis's to the left of the Cashtown pike, with Pettigrew's and Brockenbrough's brigades in support. The Confederates advanced skirmishing heavily with Buford's dismounted troopers. Calef's battery engaging double the number of its own guns, was served with an efficiency worthy of its ancient reputation as "Duncan's battery" in the Mexican

war, and so enabled the cavalry to hold their long line for two hours. When Buford's report of the enemy's advance reached Reynolds, the latter, ordering Doubleday and Howard to follow, hastened toward Gettysburg with Wadsworth's small division (two brigades, Meredith's and Cutler's) and Hall's Second Maine battery. As he approached he heard the sound of battle, and directing the troops to cross the fields toward the firing, galloped himself to the seminary, met Buford there, and both rode to the front, where the cavalry, dismounted, were gallantly holding their ground against heavy odds. After viewing the field, he sent back to hasten up Howard, and as the enemy's main line was now advancing to the attack, directed Doubleday, who had arrived in advance of his division, to look to the Fairfield road, sent Cutler with three of his five regiments north of the railroad cut, posted the other two under Colonel Fowler, of the Fourteenth New York, south of the pike, and replaced Calef's battery by Hall's; thus relieving the cavalry. Cutler's line was hardly formed when it was struck by Davis's brigade on its front and right flank, whereupon Wadsworth, to save it, ordered it to fall back to Seminary Ridge. This order not

reaching the One Hundred and Forty-seventh New York, its gallant Major, Harney, held that regiment to its position until, having lost half its numbers, the order to retire was repeated. Hall's battery was now imperiled, and it withdrew by sections, fighting at close canister range and suffering severely. Fowler thereupon changed his front to face Davis's brigade, which held the cut, and with Dawes's Sixth Wisconsin,—sent by Doubleday to aid the One Hundred and Forty-seventh New York,—charged and drove Davis from the field. The Confederate brigade suffered severely, losing all its field officers but two, and a large proportion of its men killed and captured, disabling it for further effective service on that day. In the meantime, Archer's Confederate brigade had occupied McPherson's wood, and as the regiments of Meredith's "Iron Brigade" came up, they were sent forward by Doubleday, who fully recognized the importance of the

position, to dislodge it. At the entrance of the wood they found Reynolds in person, and, animated by his presence, rushed to the charge, struck successive heavy blows, outflanked and turned the enemy's right, captured General Archer and a large portion of his brigade, and pursued the remainder across Willoughby Run. Wadsworth's small division had thus won decided successes against superior numbers, but it was at grievous cost to the army and the country, for Reynolds, whilst directing the operations, was killed in the wood by a sharp-shooter. It was not, however, until he had by his promptitude and gallantry determined the decisive field of the war, and brilliantly opened a battle which required three days of hard fighting to close with a victory. To him may be applied in a wider sense than in its original one, Napier's happy eulogium on Ridge: No man died on that field with more glory than he, yet many died, and there was much glory.

After the repulse of Davis and Archer, Heth's division was formed in line mostly south of the Cash-town pike, with Pender's in second line, Pegram's and McIntosh's artillery (nine batteries) occupying all the commanding positions west of Willoughby Run; Doubleday reestablished his former lines, Meredith holding McPherson's wood. Soon after, Rowley's and Robinson's divisions (two brigades each) and the four remaining batteries of the corps arrived. Rowley's division was thrown forward, Stone's brigade to the interval between

Meredith and Cutler, and Biddle's with Cooper's battery to occupy the ridge between the wood and the Fairfield road. Reynolds's battery replaced Hall's, and Calef's rejoined Gamble's cavalry, now in reserve. Robinson's division was halted near the base of Seminary Ridge. By this time, near noon, General Howard arrived, assumed command, and directed General Schurz, commanding the Eleventh Corps, to prolong Doubleday's line toward Oak Hill with Schimmelpfennig's and Barlow's divisions and three batteries, and to

post Steinwehr's division and two batteries on Cemetery Hill, as a rallying point. By one o'clock, when this corps was arriving, Buford had reported Ewell's approach by the Heidlersburg road, and Howard called on Sickles at Emmetsburg and Slocum at Two Taverns for aid, to which both these officers promptly responded. It was now no longer a question of prolonging Doubleday's line, but of protecting it against Ewell whilst engaged in front with Hill. Schurz's two divisions, hardly six thousand effectives, accordingly formed line on the open plain, half a mile north of the town. They were too weak to cover the ground, and a wide interval was left between the two corps, covered only by the fire of Dilger's and Wheeler's batteries (ten guns) posted behind it.

That morning, whilst on the march to Cash-town, Ewell received Hill's notice that his corps was advancing to Gettysburg, upon which he turned the heads of his own columns

GRAVE OF CONFEDERATE DEAD ON THE FIELD OF THE FIRST DAY. (FROM A PHOTOGRAPH.)

to that point. Reporting the change by a staff-officer to General Lee, Ewell was instructed that if the Federals were in force at Gettysburg a general battle was not to be brought on until the rest of the army was up. Approaching Gettysburg, Rodes, guided by the sounds of battle, followed the prolongation of Seminary Ridge; Iverson's, Daniel's, and Ramseur's brigades on the western, O'Neal's and Doles's on the eastern slope. Ewell, recognizing the importance of Oak Hill, ordered it to be occupied by Carter's artillery

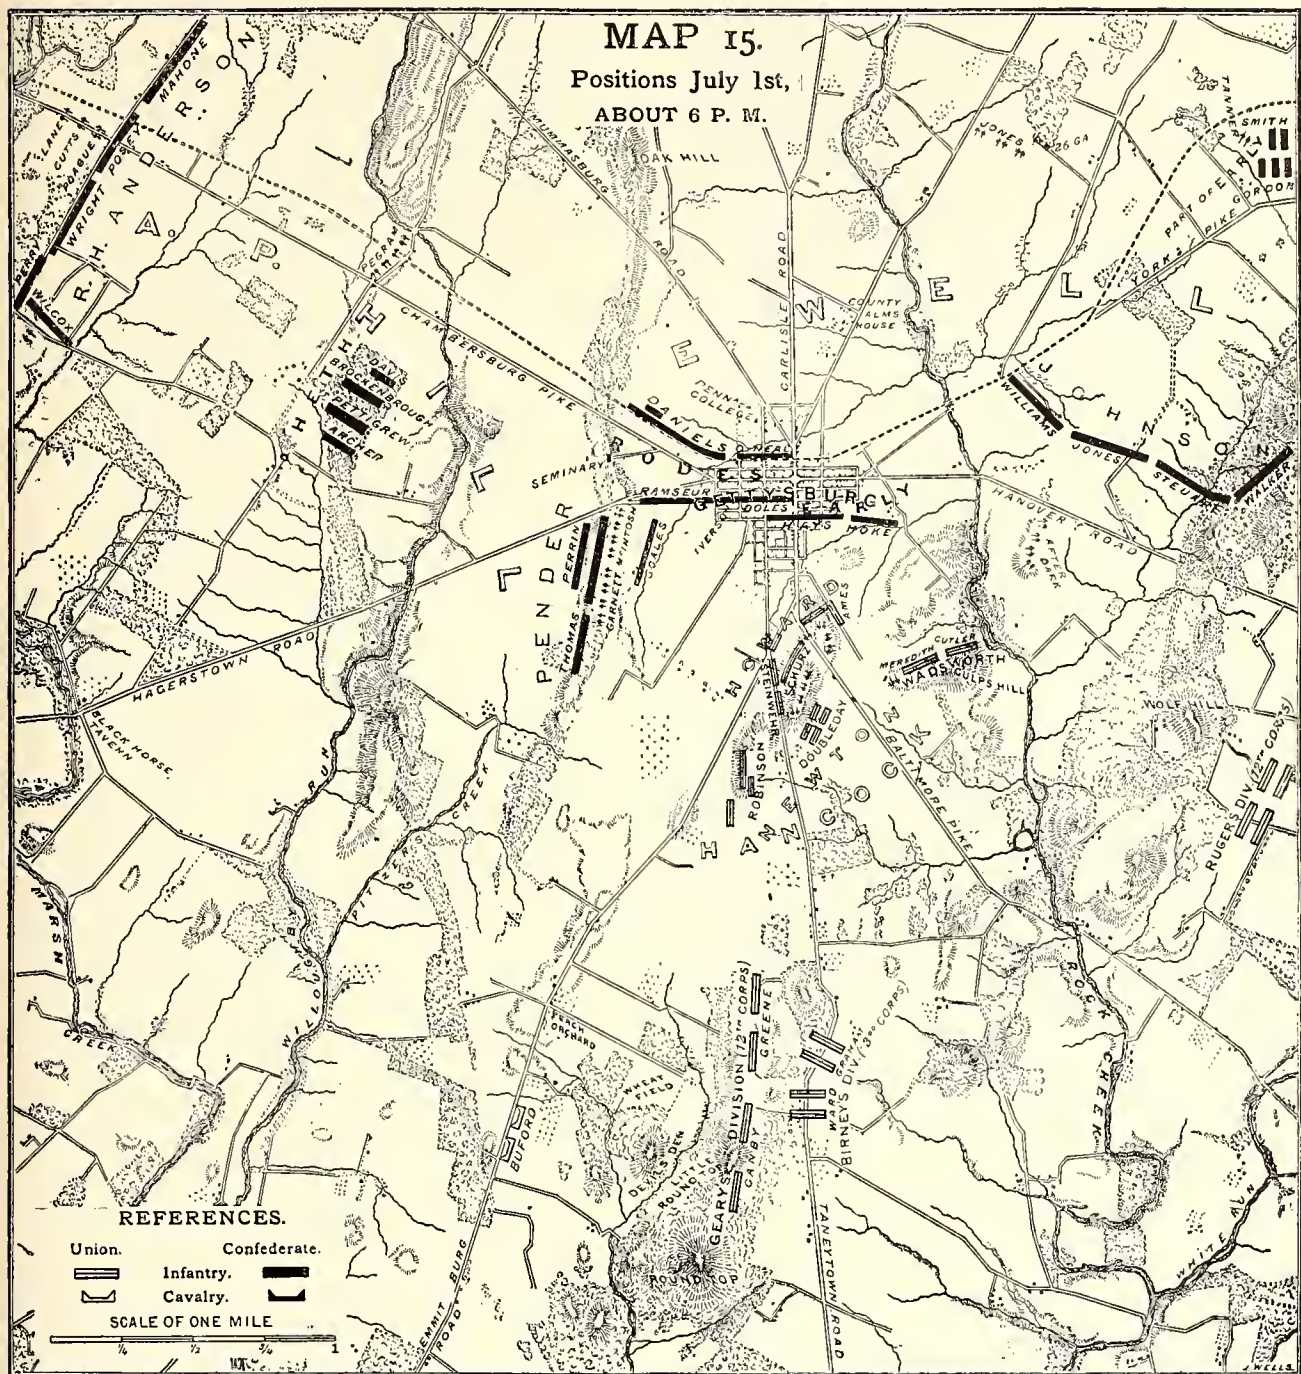

THE LINE OF DEFENSE AT THE CEMETERY GATE-HOUSE. (FROM A PHOTOGRAPH.)

battalion, which immediately opened on both the Federal corps, enfilading Doubleday's line. This caused Wadsworth again to withdraw Cutler to Seminary Ridge, and Reynolds's battery was posted near McPherson's house, under partial cover. Stone therefore placed two of his three regiments on the Cashtown pike, so as to face Oak Hill. This left an interval between Stone and Cutler, through which Cooper and Reynolds could fire with effect, and gave to these lines a cross-fire on troops entering the angle between them. Robinson now sent his two brigades to strengthen Cutler's right. They took post behind the stone walls of a field, Paul's brigade facing west, Baxter's north. Rodes, regarding this advance as a menace, gave orders at 2:30 P. M. to attack. Iverson, sweeping round to his left, engaged Paul, who prolonged Cutler's line, and O'Neal attacked Baxter. The repulse of O'Neal soon enabled Baxter to turn upon Iverson. Cutler also attacked him in flank, and after losing five hundred men killed and wounded, three of Iverson's regiments surrendered. General Robinson reports the capture of one thousand prisoners and three colors; General Paul was severely wounded, losing both eyes. Meanwhile Daniel's brigade advanced directly on Stone, who maintained his lines against this attack and also Brockenbrough's, of Hill's corps, but was soon severely wounded. Colonel Wister, who succeeded him, met the same fate, and Colonel Dana took command of the brigade. Ramseur, who followed Daniel, by a conversion to the left now faced Robinson and Cutler with his own brigade, the remnant of Iverson's, and one regiment of O'Neal's,

his right connecting with Daniel's left, and the fighting was hot. East of the Ridge, Doles's brigade had been held in observation, but about 3:30 P. M., on the advance of Early, he sent his skirmishers forward and drove those of Devin's—who had gallantly held the enemy's advance in check with his dismounted troopers—from their line and its hillock on Rock Creek. Barlow, considering this an eligible position for his own right, advanced his division, supported by Wilkeson's battery, and seized it. This made it necessary for Schurz to advance a brigade of Schimmelpfennig's division to connect with Barlow, thus lengthening his already too extended line.

The arrival of Early's division had by this time brought an overwhelming force on the flank and rear of the Eleventh Corps. On the east of Rock Creek, Jones's artillery battalion, within easy range, enfiladed its whole line and took it in reverse, while the brigades of Gordon, Hays, and Avery in line, with Smith's in reserve, advanced about four P. M. upon Barlow's position, Doles, of Rodes's division, connecting with Gordon. An obstinate and bloody contest ensued, in which Barlow was desperately wounded, Wilkeson killed, and the whole corps forced back to its original line, on which, with the aid of Coster's brigade and Heckman's battery, drawn from Cemetery Hill, Schurz endeavored to rally it and cover the town. The fighting here was well sustained, but the Confederate force was overpowering in numbers, and the troops retreated to Cemetery Hill, Ewell entering the town about 4:30 P. M. These retrograde movements had uncovered the flank of the First Corps and made its right untenable.

Meanwhile, that corps had been heavily engaged along its whole line; for, on the approach of Rodes, Hill attacked with both his divisions. There were thus opposed to the single disconnected Federal line south of the Cashtown pike two solid Confederate ones which outflanked their left a quarter of a mile or more. Biddle's small command, less than one thousand men, after a severe contest, was gradually forced back. In McPherson's wood and beyond, Meredith's and Dana's brigades repeatedly repulsed their assailants, but as Biddle's retirement uncovered their left, they too fell back to successive positions from which they inflicted heavy losses, until finally all three reached the foot of Seminary Ridge, where Colonel Wainwright, commanding the corps

artillery, had planted twelve guns south of the Cashtown pike, with Stewart's battery, manned in part by men of the Iron Brigade, north of it. Buford had already thrown half of Gamble's dismounted men south of the Fairfield road. Heth's division had suffered so severely that Pender's had passed to its front, thus bringing fresh troops to bear on the exhausted Federal line.

It was about four P. M. when the whole Confederate line advanced to the final attack. On their right Gamble held Lane's brigade for some time in check, Perin's and Scales's suffered severely, and Scales's was broken up, for Stewart, swinging half his guns, under Lieutenant Davison, upon the Cashtown pike, raked it. The whole corps being now heavily

JOHN L. BURNS, "THE OLD HERO OF GETTYSBURG."
(FROM A PHOTOGRAPH TAKEN SOON AFTER THE BATTLE.)

In his official report, General Doubleday says: "My thanks are specially due to a citizen of Gettysburg named John Burns, who, although over seventy years of age, shouldered his musket and offered his services to Colonel Wister, 150th Pennsylvania Volunteers. Colonel Wister advised him to fight in the woods, as there was more shelter there; but he preferred to join our line of skirmishers in the open fields. When the troops retired, he fought with the Iron Brigade. He was wounded in three places."

pressed and its right uncovered, Doubleday gave the order to fall back to Cemetery Hill, which was effected in comparatively good order, the rear, covered by the Seventh Wisconsin, turning when necessary to check pursuit. Colonel Wainwright, mistaking the order, had clung with his artillery to Seminary Hill, until, seeing the infantry retreating to the town, he moved his batteries down the Cashtown pike until lapped on both sides by the enemy's skirmishers, at close range, when they were compelled to abandon one gun on the road, all its horses being killed. The Eleventh Corps also left a disabled gun on the field. Of the troops who passed through the town, many got entangled in the streets, lost their way, and were captured, principally men of the Eleventh Corps.

On ascending Cemetery Hill, the retreating troops found Steinwehr's division in position covered by stone fences on the slopes, and occupying by their skirmishers the houses in front of their line. As they arrived they were formed, the Eleventh Corps on the right, the First Corps on the left of Steinwehr. As the batteries came up, they were well posted by Colonels Wainwright and Osborn, and soon a formidable array of artillery was ready to cover with its fire all the approaches. Buford assembled his command on the plain west of Cemetery Hill, covering the left flank and presenting a firm front to any attempt at pursuit. The First Corps found a small reënforcement awaiting it, in the Seventh Indiana, part of the train escort which brought up nearly five hundred fresh men. General Wadsworth met and led them to Culp's Hill, where, under direction of Captain Pattison of that regiment, a defensive line was marked out. Their brigade (Cutler's) soon joined them; wood and stone were plentiful, and soon the right of the line was solidly established.

Nor was there wanting other assurance to the men who had fought so long that their sacrifices had not been in vain. As they reached the hill they were received by General Hancock, who arrived just as they were coming up from the town, under orders from General Meade to assume the command. His person was well known; his presence inspired confidence, and it implied also the near approach of his army-corps. Ordering Wadsworth at once to Culp's Hill to secure that important position,—an excellent selection,—and aided by Howard, and Warren who had also just arrived from headquarters, and others, a strong line, well flanked, was soon formed.

General Lee, who had from Seminary Hill witnessed the final attack, sent Colonel Long, of his staff, a competent officer of sound judgment, to examine the position, and directed Ewell to carry it if practicable, renewing, however, his previous warning to avoid bringing on a general engagement until the army was all up. Both Ewell, who was making some preparations with a view to attack, and Long found the position a formidable one, strongly occupied, and not accessible to artillery fire. Ewell's men were indeed in no condition for an immediate assault. Of Rodes's eight thousand, nearly three thousand were *hors de combat*. Early had lost over five hundred, and had but two brigades disposable, the other two having been sent on the report of the advance of Federal troops, probably the Twelfth Corps, then near by, to watch the York road. Hill's two divisions had been very roughly handled, had lost heavily, and he withdrew them to Seminary Hill as Ewell entered the town,

leaving the latter without more than eight thousand men to secure the town and the prisoners. Ewell's absent division was expected soon, but it did not arrive until near sunset, when the Twelfth Federal Corps and Stannard's Vermont brigade were also up, and the Third Corps arriving. In fact an assault by the Confederates was not practicable before

5:30 P. M., and after that the position was perfectly secure. For the first time that day the Federals had the advantage of position, and sufficient troops and artillery to occupy it, and General Ewell would not have been justified in attacking without the positive orders of General Lee, who was present, and wisely abstained from giving them.

Henry J. Hunt.

MEMORANDA ON THE CIVIL WAR.

A Young Hero of Gettysburg.

SINCE the great battle of Gettysburg it has been commonly supposed that Constable John L. Burns, the old hero of three-score years and ten so justly famous in song and story, who hurried to

the scene with his trusty rifle at the first clash of arms on the morning of July 1st and fought until thrice wounded, was the only citizen of that now historic town, or of the vicinity, who took up arms in defense of native soil. Yet such is not the case. I am able now to present another, a mere youth, in point of age standing almost at the other extreme of human life.

On the day before the battle, while the company in which I was serving (A, Twelfth Massachusetts) was at Marsh Run, two and one-half miles north of Emmettsburg, Maryland, and about five miles from Gettysburg, Anson B. Barton, one of our sergeants, went to that stream for water. While filling his canteen he was approached by a slender lad, apparently not more than sixteen years old, who made some inquiries as to the probable outcome of the movements then in progress, and being informed that we would undoubtedly soon encounter the enemy, and that then a great battle would be fought, his eyes glowed with enthusiasm, and he expressed a wish to join the army at once, "and fight the rebels."

Sergeant Barton took the little fellow into camp, turning him over to Captain Clark with the remark: "Captain, here's a recruit for you." The boy was then taken to headquarters, where Colonel Bates questioned him closely, and something like a "scene" ensued. The little fellow was desperately in earnest. In answer to the colonel's questions he said that he lived near there; that he was "willing to be mustered into service if necessary," but that in any event he was determined to "fight the rebels," and would do so whether enrolled as a soldier or not if the colonel would give him "a musket and a box of cartridges." The interview finally ended by the colonel remarking to Captain Clark: "Well, captain, you may take him into your company if you wish, but we cannot muster him in now, as the books are back with the teams."

So the little patriot was turned over to our company. Our men took kindly to him from the start, for we were all charmed by the spirit he had shown, and

every one set about actively to fit him for his new duties. After an extended search, a cap, blouse, musket, and roundabout were secured, together with a supply of ammunition, and thus equipped he took his place in the ranks.

The next day our corps (the First) met the enemy at Gettysburg, and a terrible battle took place. Our little recruit fought with the steadiness of a veteran, and was twice wounded. When we fell back to Cemetery Hill we had to leave him lying upon the field, but the enemy kindly brought him off and placed him in a hospital inside the town. Here he was seen after the battle by one of our men, and until a few months ago this was supposed to be the only trace the survivors of the company had of their little hero. Even his name was thought to have been forgotten.

Last autumn, having been invited to deliver the dedicatory address at the unveiling of the regimental monument at Gettysburg, and thinking that the occasion would be an appropriate one upon which to mention such facts as I might be able to gather in regard to the boy, I made diligent inquiry among my comrades. By Lieutenant Whitman of New York city, who at the battle of Gettysburg was a sergeant in Company A, I was informed that the little fellow's name was J. W. Weakley, and that after the battle he was sent to the hospital at Carlisle. This information, although only partly correct, led finally to a successful result, as will be seen below.

I then addressed a letter to Surgeon-General Murray, United States Army, asking if the name in question appeared upon the records of the hospital at Carlisle, and, in case it did, if he could give me any further information in regard to the boy. That official very kindly replied to my inquiries, although his letter did not come to hand in season for use at the dedication. It was as follows:

"WAR DEPARTMENT, SURGEON-GENERAL'S OFFICE,
WASHINGTON, D. C., October 20, 1885.

"MR. GEORGE KIMBALL, BOSTON, MASS.

"SIR: In reply to your letter of the 3d instant, asking whether the records of the hospital at Carlisle, Pennsylvania, contain the name of J. W. Weakley, and whether or not he recovered, and where he belonged, I have to inform you that the records of Post Hospital, Carlisle, Pennsylvania, between June and August, 1863, are not on file at this office. It appears, however, from the records of the General Field Hospital First Army Corps, Gettysburg, Pennsylvania, that C. F. Weakley, private Company A, Twelfth Massachusetts, was admitted to that hospital; complaint, 'Right thigh and arm'; no disposition given. He is also reported on the records of the Superintendent of Hospitals at Gettysburg, for July 1st, 2d, and 3d; complaint, 'Gun-shot, right arm and thigh.' No further record concerning the above-

named soldier is found. The information above given must not be used as a basis for any claim against the United States Government.

"Very respectfully, your obedient servant,

"R. MURRAY,

"Surgeon-General United States Army."

My imperfect mention of the matter at Gettysburg excited the interest of Mr. W. H. Tipton and other gentlemen of that town, and active work was at once begun to discover, if possible, young Weakley's antecedents. After the receipt of the Surgeon-General's letter, I wrote to Mr. Samuel Motter, editor of the Emmettsburg "Chronicle," with this end also in view. Some years before I had written to the Selectmen of Emmettsburg in regard to the affair, and my letter found its way into Mr. Motter's paper; but I did not then know the name of the boy, so no result was obtained. Now, however, I felt quite confident of success.

In a few days I received a reply from Mr. Motter, giving me the results of his investigations, which were very gratifying. They were, in substance, that young Weakley, at the time of the events above described, was living with his father on a mountain about three miles from Emmettsburg, his mother being dead. Both father and son were somewhat eccentric—even nomadic—in their manner of life. They were both well known in Emmettsburg, but were, however, without "social standing." The boy often wandered from the paternal roof, and frequently separated himself for weeks from his father. It was probably during one of these aimless excursions from his mountain home that young Weakley became impressed with the duty he owed his country, and acted upon his convictions. He was often seen upon the streets of Emmettsburg after the battle, with his injured arm in a sling, and showing other evidences of hardship and suffering, but the people of the town did not believe his story, or credit him with sufficient courage to go voluntarily into a battle. Such is often the lot of the poor and lowly, who, nevertheless, often perform deeds of patriotism and noble daring.

Young Weakley soon recovered from his wounds, and, although of delicate physique and at that time subject to epilepsy, enlisted in a Maryland regiment. After several months' service in Virginia, he became still weaker physically, and one day his comrades found him lying dead at the bottom of a ditch into which he had evidently fallen from exhaustion. Some years after the war, his father obtained a pension on account of the son's death, but the present whereabouts of Mr. Weakley are unknown to the people of Emmettsburg.

The name of this heroic young mountaineer deserves a place upon the roll of fame beside that of John L. Burns of Gettysburg.

BOSTON, August, 1886.

George Kimball.

Comments on "General Grant's Reasons for Relieving General William F. Smith."

As we derive our greatest pleasures from favors unintentionally bestowed, I desire to make my acknowledgments to those who have hunted up and furnished for publication, in the September CENTURY, my letter to the late Senator Foot, dated July 30, 1864. That letter was evidently written to prove that upon the

showing of General Grant, himself, there was no charge affecting my military reputation, and I entered into no discussion as to the validity of General Grant's reasons. That forgotten letter is valuable to me as showing to many friends, who in later days have questioned me on the subject that my statements in regard to my removal from command in July, 1864, are more at length but substantially the same as those furnished to Senator Foot on the heels of the occurrence to which it relates. All those who have heard my statements will, I think, bear me witness that after stating all the reasons General Grant gave at the time for his action, I have invariably said that I was in utter ignorance of the real cause which induced my summary removal from an important military command. When General Grant stated that he removed me because he could not relieve General Butler, I said that could not be the reason because General Butler was relieved by order of the President, and before I had been placed in command, but after I had asked General Grant to let me go to some other field of duty. From that position General Grant himself retreated, and then spoke of an article in the "New York Tribune" which he thought I had written. To that I replied, "You cannot have relieved me because you suspected me of writing such a paper; and the truth is that I never saw or heard of the article until it was published, and have not the faintest idea of its authorship." After this statement General Grant brought up two other reasons, equally without foundation, and *all* these reasons having reference to events which had taken place before my assignment to the command of the Army of the James. The charge that I had months before written two letters to two of General Grant's most devoted friends to urge him not to carry out a particular campaign when he stood committed to another on the records of the War Department, is hardly worthy a reference. When General Grant closed the interview to which I have referred, he made a remark on which, with facts and letters in my possession, I based a theory as to the reasons which brought about my removal. I could not offer that theory unsupported by sufficient data, and so in view of all the facts known to me, I am clearly entitled to reassert that I am to-day in ignorance of the real causes which induced my removal from a command to which I had been assigned only two weeks before,—ten days of which had been spent on leave of absence,—and when the command had come to me both unexpectedly and without solicitation.

Wm. Farrar Smith.

The Finding of Lee's Lost Order.

In reply to your request for the particulars of the finding of General Lee's lost dispatch, "Special Orders 191," and the manner in which it reached General McClellan, I beg leave to submit the following account:

The Twelfth Army Corps arrived at Frederick, Maryland, about noon on the 13th of September, 1862. The Twenty-seventh Indiana Volunteers, of which I was colonel at that date, belonged to the Third Brigade, First Division, of that corps.

We stacked arms on the same ground that had been occupied by General D. H. Hill's corps the evening before.

Within a very few minutes after halting, the order was brought to me by First Sergeant John M. Bloss and Private B. W. Mitchell, of Company "F" Twenty-seventh Indiana Volunteers, who stated that it was found by Private Mitchell near where they had stacked arms. When I received the order it was wrapped around three cigars, and Private Mitchell stated that it was in that condition when found by him.

General A. S. Williams was in command of our division. I immediately took the order to his headquarters, and delivered it to Colonel S. E. Pittman, General Williams's Adjutant-General.

The order was signed by Colonel Chilton, General Lee's Adjutant-General, and the signature was at once recognized by Colonel Pittman, who had served with Colonel Chilton at Detroit, Michigan, prior to the war, and was acquainted with his handwriting. It was at once taken to General McClellan's headquarters by Colonel Pittman. It was a general order giving directions for the movement of General Lee's entire army, designating the route and objective point of each corps. Within one hour after finding the dispatch, General McClellan's whole army was on the move, and the enemy were overtaken next day, the 14th, at South Mountain, and the battle of that name was fought. During the night of the 14th General Lee's army fell back toward the Potomac River, General McClellan following the next day. On the 16th they were overtaken again, and the battle of Antietam was fought mainly on the 17th. General D. H. Hill says in his article in the May *CENTURY* that the battle of South Mountain was fought in order to give General Lee time to move his trains, which were then parked in the neighborhood of Boonsboro'. It is evident from General Lee's movements from the time he left Frederick City that he intended to recross the Potomac without hazarding a battle in Maryland, and had it not been for the finding of this lost order the battle of South Mountain and probably that of Antietam would not have been fought.

For confirmation of the above statements in regard to the finding of the dispatch, you are respectfully referred to Colonel Samuel E. Pittman, of Detroit, Michigan, and Captain John M. Bloss, of Muncie, Indiana.

Very respectfully,

WASHINGTON, D. C., June 2, 1886.

S. Colgrove.

NOTE.—Mr. W. A. Mitchell, the son of Private Mitchell, who, as General Silas Colgrove describes above, was the finder of Lee's order, writes that his father was severely wounded at Antietam. After eight months in hospital he completed his term of enlistment, three years, and three years after his discharge died at his home in Bartholomew, Indiana. As his family were then destitute, efforts were made to procure a pension for the widow, but without success. The following letter from General McClellan to the son is of interest:

"TRENTON, NEW JERSEY, November 18, 1879. W. A. MITCHELL, ESQ., LA CYGNE, KANSAS. DEAR SIR: Your letter of the 9th inst. has reached me. I cannot, at this interval of time, recall the name of the finder of the papers to which you refer—it is doubtful whether I ever knew the name. All that I can say is that on or about the 13th September, 1862,—just before the battles of South Mountain and Antietam,—there was handed to me by a member of my staff a copy (original) of one of General Lee's orders of march, directed to General D. H. Hill, which order developed General Lee's intended operations for the next few days, and was of very great service to me in enabling me to direct the movements of my own troops accordingly. This order was stated to have been found on one of the abandoned campgrounds of the Confederate troops by a private soldier, and, as I think, of an Indiana regiment. Whoever found the order in question and transmitted it to the headquarters showed intelligence and deserved marked reward, for he rendered an infinite service. The widow of that soldier should have her pension without a day's delay. Regretting that it is not in my power to give the name of the finder of the order, I am very truly yours, GEO. B. McCLELLAN."—EDITOR.

McClellan's Kindness.

REFERENCE is frequently made to the peculiar personal attachment which General McClellan's troops had for him. The following incident may be worthy of record as illustrating one of the causes of this attachment:

In August, 1862, during the march of the Army of the Potomac from Harrison's Landing to Fort Monroe, the Eighty-fifth Regiment Pennsylvania Volunteers was halted about midday just before crossing the pontoon bridge over the Chickahominy. It was extremely hot, and the road very dusty. A group of tired soldiers flung themselves on the ground to rest, not noticing that they were on the leeward side of the road.

Presently the clanking of sabers told of the approach of a body of mounted men. Just as they reached us the leader drew up and said quietly: "Better cross to the other side, lads, or you will be covered with dust." It was a slight act, but it showed that the commander of the army—for such we recognized him to be, just as he and his staff passed on—was not indifferent to the comfort of the humblest soldier.

M. L. Gordon.

SOUTH PASADENA, CAL., June 5, 1886.

THE REFORMER.

THIS is, O Truth, the deepest woe
Of him thou biddest to protest:—
With men no kinship may he know;
Thy mission hems from worst and best.

The wolf that gauntly prowled the wood
From human kind more mercy got,
Than he who warns men to be good,
And stands alone, yet flinches not.

Thou grantest not one friendly hand
Or heart on which he may rely;
Alone and dauntless he must stand,
Alone must fight, alone must die!

Paul Hermes.

THE TEMPLE OF THE EPHESIAN ARTEMIS, AND THE ANCIENT SILVER PATERA FROM BERNAY.

"More than twenty-two centuries ago, in the year 356 before the Christian era, two remarkable events are recorded to have taken place on the same night. The queen of Philip of Macedon gave birth to a son destined to be the conqueror of the East, and the temple of the Ephesian Artemis was burnt by Herostratus. The Ephesian people were not long in repairing this great calamity, and the new temple which they erected far surpassed its predecessor in magnificence. It was this later temple which, when St. Paul visited Ephesus, ranked among the Seven Wonders of the ancient world, and of which the site, long sought for by travelers, was found by Mr. Wood in 1873."

I.

WITH these words Mr. C. T. Newton begins his interesting essay on "Discoveries at Ephesus." The earlier temple, which was burned by Herostratus, had certainly already been begun between 560 and 546 before our era. For Herodotus tells us that Croesus, who reigned between these years, had dedicated most of the columns in the temple. We learn from Pliny that the building of the temple took a hundred and twenty years. Furthermore, the following artists' names are associated with the building: Chersiphron was the first architect, and Theodorus of Samos, the famous sculptor who flourished somewhere about the year 600, gave his advice with regard to the method of laying the foundations; Metagenes continued the work begun by Chersiphron, and the building was finally completed by Pæonius (the architect of the temple of the Didymean Apollo near Miletus) and Demetrius. According to these data Brunn places the completion of the temple about the year 460, its beginning thus reaching back to about the year 580 before our era. Of this earlier temple, begun by Chersiphron, Mr. Wood's excavations have probably brought to light the pavement (the lowest of the three he discovered), and certainly several fragments of decorative sculpture belonging to it. These fragments are now in the British Museum. Among them there are several female heads and fragments of bodies. All these are in high relief, and are attached to a curved background with a molding at the foot from the curve of which was obtained a circle of six feet in diameter. The sculptures, moreover, are thoroughly archaic, of the sixth century. It is thus highly probable that they form part of the very sculptured columns dedicated by Croesus.

Immediately after the destruction of the temple by Herostratus the reconstruction was begun under the direction of Deinocrates, the most renowned architect of his time. Contributions by the Ephesian citizens as well

as the neighboring peoples supplied part of the means. Some of the Ephesian women even sold their jewels to contribute to the fund, and wealthy patrons dedicated columns, their names being inscribed at the foot of the fluted pillars. One of these dedications by a lady of Sardis has been discovered by Mr. Wood. When Alexander the Great came to Ephesus he offered to refund the expenses already incurred and to complete the construction of the temple at his own cost if he were allowed to dedicate the whole to the goddess with his name inscribed upon it. The priests of the temple declined this offer, thus acting very differently from the priests of Athene Polias at Priene. Mr. Newton has drawn attention to the fact that on the walls of that temple Alexander set his name as dedicator, probably immediately after his visit to Ephesus. The block of marble on which this is engraved may be seen in the British Museum. The bold, clear letters are as fresh as on the day they were cut.

After Alexander the temple and priesthood of Artemis retained, nay, even increased their importance, though the city was often unsuccessful in its policy, frequently choosing the losing side. The wealthy Ephesus presented itself as a prize to the contending princes, the Ptolemies and the Seleukidæ, and passed from Antigonos to Lysimachus, to Demetrius, to the Pergamenian monarchs (Eumenes and Attalus), and finally to the Romans. Despite these political vicissitudes, Ephesus remained in the later times the most flourishing and wealthy city of Asia Minor. Under the Roman emperors it received the title of the First City of Asia, and many other privileges and titles were conferred upon it. By its sacred traditions, its wealth and splendid festivals (the festival of Artemis lasted during the whole month Artemision, *i. e.*, the latter half of March and the first half of April), it attracted settlers of various nationalities and became the goal of pilgrims and of the art-seeking patrician travelers of Rome. According to Mr. Wood's

discoveries, the theater could seat twenty-four thousand spectators. Above all, it was the temple of Artemis and its priesthood which grew in wealth and importance, and here the policy pursued, if not always the most religious, was at all events most successful in a worldly sense. The riches of the temple were continually accumulating, so that, according to Pliny, it would require volumes to describe the treasures. The Romans restored to the temple the fisheries of the Selinousian lakes, which had been taken from it by the post-Alexandrian conquerors of the city. One of the greatest sources of income, however, appears to have been the business transactions carried on by the priesthood; for from the earliest days they established a kind of bank deposit, a business involving but few risks and likely to lead to very high profit. Kings and private individuals intrusted their money to the care of the great goddess, and her priests would reinvest this money in loans on good security. The instance of Xenophon, recounted in the "Anabasis," shows the profitable nature of these transactions. He tells us that, when about to join a warlike expedition, he deposited with the high-priest of Artemis a sum of money, the proceeds of spoils of war. In the event of his being killed in battle, this money was to be employed in any manner most pleasing and acceptable to the goddess; if he returned safe, he was to have the right of reclaiming his deposit. This he did when some years afterward he met the same high-priest at Olympia.

The history of this development, or rather degeneration, of sacerdotal functions appears to me a very natural one. The awe pertaining to sacred edifices and to everything connected with them, and the comparative inviolability of their rights to possession, gave them from the earliest times the greatest security of tenure; and thus, throughout the history of Greece, they naturally became the public treasuries, especially when the god or goddess was the national deity closely connected with the origin and existence of the state. But then comes the decisive moment for the direction which this power is to take. If in this relation between the ancient church and state the national element in the conflux of tradition and institutions is the more decided and supreme, the sacred treasure-house becomes the national treasury. This was the case at Athens, where the temple of Athene Parthenos was the treasury of the Attic commonwealth, for a time even of the Greek confederacy. If, on the other hand, the sacerdotal element was the more pronounced in the national community, if the tradition and con-

stitution of the place was of a hierarchical character, the custom of accumulating treasures was sure to develop into some form of financial enterprise. This was the case with the Artemision of Ephesus.

After the time of Alexander the Great, the sanctuary of Artemis formed a separate suburb of the town, completely independent of it. The boundaries of the sacred municipal property were often a question of dispute, and were frequently readjusted by the various rulers under whose sway Ephesus came. In the time of Antonius the Triumvir the sacred domain of the Artemision extended twice as far as it had in the time of Mithridates, who had already enlarged the boundaries assigned by Alexander, so that a part of the Artemision extended into the city and the landmarks of the sacred precinct stood in its very streets. The priesthood, too, was quite autonomous in its organization and rule, and the right of asylum which the Romans bestowed upon it freed those who once entered the sacred precinct from all civic authority.

The liberal donations and endowments made by devotees of all countries, carefully preserved and increased by skillful management, were another source of great wealth. Finally the temple was possessed of a large income from the fines and confiscations imposed by the state on those who violated its laws. Of the nature and amount of these fines we receive an adequate notion from the most valuable inscription found by Mr. Wood in digging in the theater, to which we shall have to recur in the course of this investigation. "It tells us how one Vibius Salutaris, a Roman of equestrian rank, who had filled very high offices in the state, dedicated to Artemis a number of gold and silver statues, of which the weight is given, and a sum of money to be held in trust, the yearly interest of which is to be applied to certain specified uses. On the 6th of the first decade of the month Thargelion (May 25th), on which day the mighty goddess Artemis was born, largess was to be distributed to various public functionaries in the *pronaos* of the temple. The members of the Ephesian *Boule*, or senate, were to receive one drachma each. The six tribes of the city, the high-priest and the priestess of Artemis, the two *Neopoioi*, or surveyors of the temple, the *Paidonomoi*, who had charge of the education of the boys, and other fortunate personages, came in for a share of this munificent dole. The heirs of Salutaris were made liable for the due payment of the bequests in case he should die before paying over the principal or making an assignment of the rent of certain lands for the payment of the interest. The trust is

guarded by stringent enactments. By a letter of Afranius Flavianus, *proprætor*, which is appended to the deed of trust, a fine of fifty thousand drachmæ (rather less than ten thousand dollars) is inflicted on any one, whether magistrate or private person, who attempts to set aside any of the provisions of the trust; one-half of this fine is to go to the adornment of the goddess, the other half to the imperial *fiscus*."

Ephesus and its temple thus throve and flourished throughout the whole duration of the Roman empire, and drew to its center of wealth and splendor visitors and residents from all parts of the world. Among the varied nationalities which made up the population was also a Jewish community, and to them there came, in the years 54 to 57 of our era, a Jewish man, who on his journey from Jerusalem to Damascus had become converted to the new faith, and who felt that he was destined to extend the influence of his own conversion over a wide circle of humanity. Paul first began to preach to the Jews in their own language and by an appeal to their own sentiments, then (for his training at Tarsus had made him conversant with Greek culture) to the Greeks in the schools of the Sophists; and thus was founded the Christian community which, at first small in numbers, grew so rapidly that the younger Pliny referred to this growth as an alarming phenomenon, seeming to him to require the energetic intervention of the emperor. "The temples of the gods," he says, "are empty, the sacrificial animals driven to the town find no purchasers, and even the country is affected by the new heresy." The trades and enterprises which depended upon the pilgrims flocking to the temple suffered and languished. This was especially the case with the silversmiths who sold to the pilgrims reproductions in silver of the temple and its sculptures.

During the Hellenistic revival of Hadrian Greek religion and art began to thrive anew, and so also the worship of the Ephesian goddess flourished again. Her temple again appears on the coins of Hadrian, and over one hundred years later it is figured as intact on the coins of Valerian.

Soon after this the barbarian hordes flooded the country, the Goths devastated the whole district, and in the year 262 of our era the temple was pillaged and destroyed. The city, however, remained flourishing, and was the center of Christian worship. Its first bishop had been Timotheus, appointed by Paul, and it had such sacred associations as its claim to possess the grave of the Virgin Mary and the residence of St. John the Evangelist. In Whitsuntide of the year 431 the first council

was held there, and it became the great meeting-place of the Christian world of the East.

In the thirteenth century the Turks invaded the country, destroyed the city, and built under the fortress, out of the fragments of the temple, the mosque of Selim. Even this mosque has been destroyed. At the foot of its ruins there is the small Turkish village of Ayasuluk.

Of the temple of the great goddess no sign remained on the surface. Luckily for us, as at Olympia the *Alpheius*, so here the *Cayster* covered what remained with a thick alluvial deposit.

It was owing to the persevering energy of Mr. Wood that some of the fragments of the great temple were brought to light in 1871. Of all the excavations made of late years there is hardly one that offered such difficulties and dangers. In the most unwholesome of climates, Mr. Wood dug for more than four years, during which 132,221 cubic yards of earth were excavated. There was no visible indication of the temple-site, and he had often to dig to a depth of twenty feet.

It was through the above-mentioned inscription of *Salutarius*, discovered while digging in the theater, that Mr. Wood succeeded in finding the site of the temple.

In this inscription of *Salutarius* special mention is made of the silver and gold figures and ornaments (the *eikones* and *apeikonismata*), some of which weighed from two to seven pounds; special instructions are given as to the earth to be used in cleaning them, called *argyromatike*. "At every meeting of the popular assembly, and at all the gymnastic contests, and on every other occasion to be fixed by the senate and the people, these figures are to be carried from the *pronaos* of the temple to the theater, duly guarded, and then back to the temple. During the transit through the city itself they are to be escorted by the *Ephebi*, who are to receive them at the *Magnesian gate* and accompany them after the assembly to the *Koresseian gate*." Here was the clew to the site of the temple. "Having found the *Magnesian gate*, Mr. Wood proceeded to look for the portico, built by the Sophist *Damianus* in the second century A. D., which led from that gate to the temple, and of which the purpose was to protect from bad weather those who took part in the procession. Mr. Wood succeeded in tracing the line of this portico for some distance outside the city. It followed the line of an ancient road, and pointed in the direction of the plain at the foot of Ayasuluk. Another road tended in the same direction, starting from the gate near the Stadium, which Mr. Wood rightly assumed to be the *Koresseian gate* mentioned in the *Salutarius* inscription. Advancing northward

toward the point where these two roads tended to converge, he came upon an ancient wall, an inscription on which showed that it was the Peribolus of the Artemision; after which to find the site of the temple itself was only a matter of time."

Though the final and exact account of the discoveries which Mr. Wood made with regard to the temple is still to be expected, the results of his excavation enable us to form some conception of this splendid structure, which was justly considered one of the seven wonders of the world. In size it was one of the most impressive edifices of antiquity, about twice as large in its area as the Parthenon of Athens. According to Pliny, the whole temple was four hundred and twenty-five (Greek) feet in length by two hundred and twenty feet in width. After speaking of the tomb of Por-senna and the hanging gardens of Thebes [? Babylon], he continues: "But the temple of the Ephesian Artemis is a work of truly admirable magnificence, which was raised at the joint expense of all Asia, and occupied two hundred and twenty years in building. It was placed on a marsh, in order that it should not be endangered by earthquakes or cleavings of the ground. Besides, that the foundation of such a pile might not be laid on a sliding or unsuitable foundation, they laid a bed of charcoal, over which they placed fleeces of wool. The total length of the temple is four hundred and twenty-five feet, its width two hundred and twenty feet. [It has] one hundred and twenty-seven columns, each the gift of a king and sixty feet in height. Of these thirty-six are ornamented with carvings, of which one is by Scopas. Chersiphron was the architect who directed the works."

The temple was what is called a dipteral temple; that is, it had a colonnade of two rows of columns supporting the roof on all sides. The colonnade was erected on a podium or platform, pyramidal in shape, rising in three grades. This podium was no doubt profusely decorated with sculptures in relief, of the nature of which the newly discovered reliefs from the great altar of Pergamon give an idea. Flights of smaller steps, practicable for use, intersected this platform and led up to the temple porticoes.

The point in which lies the greatest difference of opinion among modern archæologists concerns the number of columns in the peristyle surrounding the temple, and this has led to ardent discussion quite recently.* The point at issue, of the greatest importance as regards the construction of

the temple, turns upon the placing of a comma in the text of the passage of Pliny. In the translation given above, I have taken the ordinary reading and the one underlying Mr. Fergusson's restoration. In his reading of the Latin text *columnae centum viginti septem a singulis regibus factæ lx pedum altitudine*, there is no comma, and thus there would be a hundred and twenty-seven columns each given by a king. Mr. Wood places a comma after the *centum*, and thus reads: "One hundred columns, of which twenty-seven were each the gift of a king." Mr. Falkener places the comma after the *viginti*, reading: "One hundred and twenty columns, seven of which were each the gift of a king." Mr. Wood's restoration has the advantage over that of Mr. Fergusson that it follows the customary tradition of Greek octa-style temples in having an equal number of pillars in front and back with a similar entrance to the *pronaos* and *opisthodomos*, and also in that it avoids the somewhat startling notion that one hundred and twenty-seven kings each presented one column; though we must remember that the whole of Asia Minor contributed to the building of the temple, and that the term *rex* applied to the numberless rulers of petty principalities in that country. Finally it has in its favor that, as has already been remarked, among Mr. Wood's discoveries was the fragment of one of these pillars with the inscription showing it to have been dedicated by a lady of Sardis. According to Mr. Wood, then, there were two rows of eight pillars in the front and back, with two extra pillars in the *pronaos* and *opisthodomos*, and two rows of sixteen pillars along the sides between either façade. Mr. Fergusson's restoration, on the other hand, has in its favor that it conforms to the correct idiomatic reading of the passage in Pliny (a very strong point indeed), and that he presents a beautiful plan not without precedent in classical architecture. According to him, the entrance at the front is strongly marked, there being a wider general intercolumniation than in the back, and an especially wide one (more than twenty-eight feet) in the central entrance. He thus has three rows of eight columns in the front, besides four columns in the interior of the *pronaos*, and three rows of nine columns at the back, while between the pillars of front and back he places two rows of eighteen columns on either side. The highest tribute must be paid to the ingenuity of this restoration. Still the question can be ultimately settled only by the full and accurate publication of Mr. Wood's data and by further explorations of the site of the temple itself.

The most remarkable feature of this temple was its sculptured decoration, and of this most

* J. Fergusson, "Transactions of the Royal Institute of British Architects, 1882-83," p. 147, *seq.*, and "Proceedings R. I. B. A., 1883-84," p. 167; Wood, *ibid.*, p. 166.

interesting specimens have been brought to light by Mr. Wood, and are among the most precious of the great treasures of the British Museum. Among these are fragments of square blocks decorated with reliefs which Mr. Wood supposes to have belonged to the frieze, of the temple. Mr. Fergusson points out that "if they were portions of the frieze it is a most remarkable fact that he should have found and sent home the four angle-blocks of the temple and not one stone of the intermediate parts, for all those at the British Museum are sculptured on the two continuous faces." Mr. Fergusson supposes them to have formed parts of square pedestals upon which the sculptured drums of the pillars rested, and restores the whole column. It appears to me probable that these reliefs were a part of the great frieze running round the podium, of the nature of which the section through the outer portion of the podium as restored by Mr. Fergusson gives us some idea; only that then the sculptured frieze would have run continuously round the angles, and thus the divisions made by the several ascending flights of steps would require a considerable number of angle-blocks.

The most remarkable of the sculptured remains are the fragments of the sculptured drums of the columns. We must, however, feel with Mr. Newton that this exceptional practice of ornamenting with human figures the drums of columns is not in keeping with the spirit of mature Greek art, as it is quite unique in the history of Greek architecture. There is, no doubt, something unconstructive in this interruption of the weight-sustaining lines of a column, especially when the figures represented are in no way suggestive of their supporting capacity. This looks like a foreign, perhaps a Lydian, influence. Yet we must remember that the temple, in the decoration of which Scopas and Praxiteles had a share, was erected over the ruins of the previous one, rich in sacred traditions which belonged to a time in which the picture-writing tendency led the early artist to bring together in his sculptured decorations a great number of scenes. Early works like the chest of Cypselus as described by Pausanias are very instructive in this respect. Thus it seems to me probable that the profuse decoration of the later temple was suggested by the decoration of the earlier temple.

Whatever may be the artistic effect of these reliefs as part of the columns, as works of sculpture in themselves they are among the most beautiful specimens of Greek art that have come down to us, and are quite worthy to have come from the school of Scopas and Praxiteles, and even to be by the hand of

these great masters themselves. Among these, again, the most beautiful is the fragment of a drum. The drum is exactly six feet in height and a little more than six feet in diameter, and is one solid block of marble. It most probably represented a chthonic subject; for Hermes appears to be here figured as the *Psychopompos*, the leader of the souls of the deceased to Hades, and the winged youth with the sword next but one beyond Hermes is most probably Thanatos, the fair genius of death. We cannot dwell upon the supreme technical skill with which the figures are placed in the most free and natural attitudes round a circular drum, nor can we dwell upon the grace and beauty in the conception and composition of each individual figure, nor upon the perfection of the modeling in both the nude and the drapery. We can hardly be mistaken in maintaining that after the sculptures of the Parthenon these are the finest works of architectural sculpture in existence.

For all these things of beauty, as well as for the immense mass of historical information which the Ephesian excavations have already yielded, we are indebted to the untiring energy of Mr. Wood and to the liberality of those who supported him. At the time of writing he is proposing to complete his labors and to continue the excavation, and we hope that his endeavors to raise the required funds will meet with success. I have no doubt that in the United States, where, through the activity of the Archæological Institute and the enthusiastic and intelligent energy of Mr. Clarke and Mr. Bacon, such brilliant results have been achieved in the excavation of Assos, Mr. Wood's enterprise will meet with hearty sympathy.

II.

UPON examining the rich collection of silver vessels and statuettes discovered at Bernay in the department of the Eure, now in the Cabinet of Medals of the Bibliothèque Nationale at Paris, I came upon a silver patera with a medallion or *emblema* in the center, upon which, in most delicate *repoussé* work, is the figure of a youthful Hermes, nude, with a cloak (*chlamys*) hanging over his left shoulder and down by the side of his arm, a caduceus in his left hand and a purse in his right, in an attitude indicative of a slow walk, and with the head turned upwards.

The valuable discovery of this large collection of ancient silver* was made on the 21st of March, 1830. A Norman peasant named Prosper Taurin, while plowing his

* The substance of what follows has been published in the "Journal of Hellenic Studies," Vol. III., p. 96 *et seq.*

LOWEST DRUM OF SCULPTURED COLUMN, WITH FIGURE OF HERMES, DISCOVERED BY J. T. WOOD.

field situated in the hamlet Le Villeret, commune of Berthouville, arrondissement of Bernay, department of the Eure, came upon an obstacle, which, instead of simply avoiding it as his predecessors had done, he resolved to examine. Borrowing a pick from a laborer, he removed what appeared to him to be a large pebble, but what in reality was a Roman tile. When this was removed he came upon over a hundred objects in silver which were deposited on some pieces of marl at a depth of six inches, weighing considerably over fifty pounds. As with so many similar discoveries, the consideration of the weight of the silver

and its value might have led to the destruction of the remains of ancient art. Luckily Taurin listened to the advice of some intelligent friends, and the attention of local archæologists like A. Leprévost and Delahaye being drawn to the discovery, the whole collection was at last, through the intervention of Raoul Rochette and C. Lenormant, bought for the ridiculous sum of fifteen thousand francs for the Cabinet of Medals of the Bibliothèque Nationale. The patriotic peasant declined to sell it to any purchaser but a national institution of his own country.

The site of this discovery is the ancient

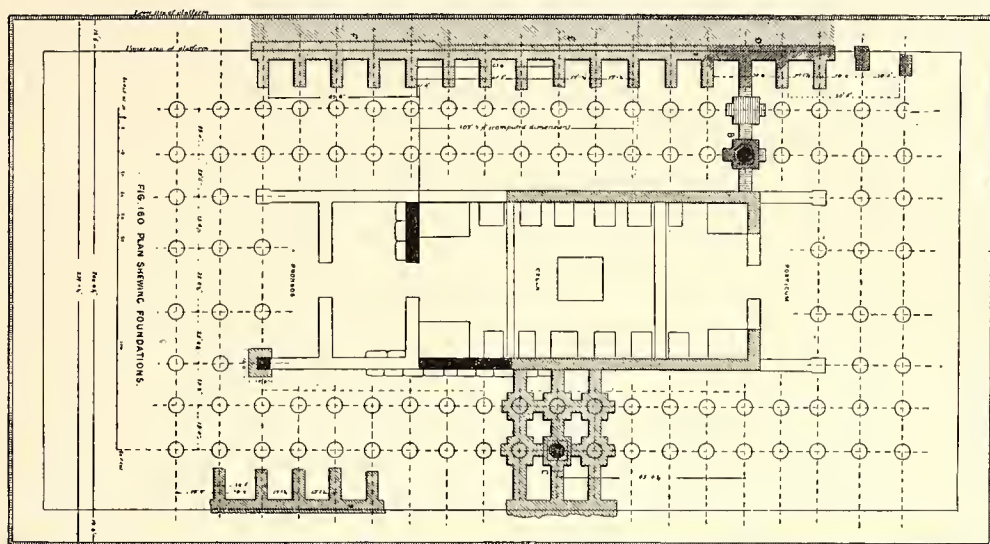

SILVER PATERA, WITH FIGURE OF HERMES. (BY DUJARDIN, PUBLISHED IN "JOURNAL OF HELLENIC STUDIES.")

Canetum, and the temple of which this crypt marked the treasury was that of Mercury Augustus of Canetum, "the great god of the Gauls, in whose temple are to be seen many statues," as Cæsar says. The difference in the number of objects as given by the authorities who have described the treasury (Leprévost, seventy; R. Rochette, over a hundred; Chabouillet, sixty-nine) is due to the fact that the first writer could not consider the find at leisure, while the second counted as single finds all the fragments which have since been put together. The true number is that given by M. Chabouillet. The collection comprises not only vessels and fragments, but also silver statuettes of Mercury, one of which reaches the height of fifty-six centimeters, or one foot ten inches.

It struck me at once that there were two distinct classes of silver vases, as well in respect

of the workmanship of the *repoussé*, as of the style of the subjects represented. The one class was in very prominent *repoussé*, the figures in high relief; the other flatter and lower in relief, with slight and delicate lines. The composition of the scenes and figures on the vases with high relief was very full, with no apparent blank spaces, and was not only pictorial but essentially decorative in character. Such were especially the Bacchic Canthari, No. 2807, and the other vases down to 2814. The compositions on the vases with low relief, however, such especially as the pateræ 2824, 2825, 2828, etc., were very simple, with an absence of bold and full lines, and the very opposite of decorative. The fact impressed itself upon me that the former group was, at least with regard to its style, later than these bas-relief compositions, and that, while the

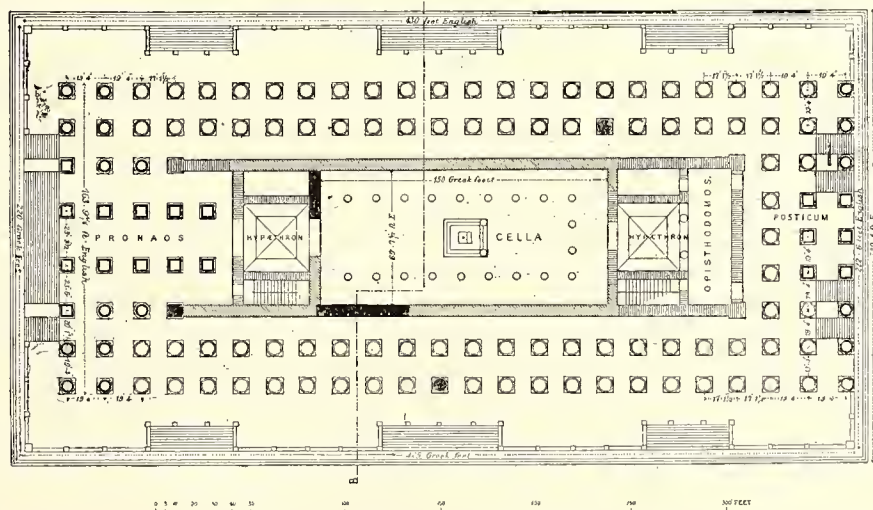

PLAN OF TEMPLE AS RESTORED BY J. T. WOOD. (FROM THE "TRANSACTIONS OF THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.")

compositions in high relief essentially suited their purpose in being ornamental, those of the bas-reliefs, generally single figures placed in the center of the *emblem*, were statuesque rather than decorative. And though I did not attach much weight to it at the time, I was impressed with the probability that these simple compositions were influenced by the nobler works of Greek sculpture, while the cups in high relief were ornamented with scenes of a more spontaneous composition.

The Hermes on the medallion of the patera No. 2824 (in M. Chabouillet's catalogue, the number now affixed to it in the Museum being 3051) suggested the style of Greek art from the middle to the close of the fourth century B. C., and more especially of the sculpture of Praxiteles and Scopas. There was all the softness and delicacy of modeling of the nude human figure, the keen feeling for texture, and the power of rendering the surface of the human body. Yet there was no attempt at obtruding the minute study of the anatomy upon the spectator, as is the case in the subsequent schools of Rhodes and Pergamon, nor were there any of the violent contortions or the introduction of frequent rounded and restless lines of later Greek and Græco-Roman sculpture. And finally, there was none of the conscious aca-

demical "canonism" in the building up of the human figure, as we notice it in the works of the school of Pasiteles and the Græco-Roman "Pre-Raphaelites," who wished to reproduce the simplicity of earlier Greek art and to reestablish simple canons. And still there is not that simply healthy and unsentimental character in this work which marks the statues of a Pheidias and a Polycleitus. But there is distinctly in this figure the introduction of elements of sentimentality and pathos which mark the works of a Scopas and a Praxiteles as they characterize this age in

PLAN OF TEMPLE AS RESTORED BY J. FERGUSSON. (FROM THE "TRANSACTIONS OF THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.")

contradistinction to that of Pheidias. I have once before attempted to indicate this difference of character between the two great ages,

especially Ephesus and Samothrace. The Hermes on the patera does not throw any immediate light upon the action of Hermes in directing his head upward, for he is here looking at the branches of an overhanging tree. But it appears to me that in the Ephesian relief the action of Hermes in looking upward is to indicate his double nature, which, though chthonic in part, is essentially concerned with the world above and the actions of man and of the Olympian gods.

In order to translate the Hermes of the Ephesian relief into a self-contained composition and a representation of the god Hermes pure and simple, the silversmith thought fit to surround him, upon the patera, with all his attributes. To this aim are to be attributed the slight deviations of the figure on the silver relief from its marble prototype. These deviations are, in the first place, that while the Hermes of Ephesus has the right shoulder free and the chlamys wound round the left forearm, the hand hidden behind his back, on the Hermes of the patera the chlamys is fastened round the neck and is gracefully slung over the left shoulder, leaving the left hand free. In the second place, while the Hermes of Ephesus holds the caduceus in the right hand, on the patera the caduceus has been transferred to the left hand and replaced by a purse in the right.

As it was the object of the silversmith to bring together as many attributes as possible, it was important that both hands should be free; the left hand could not, therefore, be hidden by the chlamys, and the cloak had to be fastened round the neck and hung over the shoulder; he could thus dispose of two attributes, the caduceus and the purse. He did not leave the caduceus in the right hand, because then the purse in the left would not have stood out well against the somewhat similar lines of the drapery, and being pressed for room on the right hand, he could not bring the caduceus in freely between the thigh and the square pillar on the right of the god.

The other attributes that are grouped about the figure are square pillars to the right and left, a common and early monument of the worship of Hermes. On the pillar on his right is placed a cock and below it some eggs, and on the left hand a tortoise. Both cock and tortoise are frequently represented as attributes of Hermes,—the tortoise a reminiscence of his invention of the lyre, the cock a symbol of the god of generation. The buck upon his left is a symbol of the same side of the nature of Hermes the protector and multiplier of herds, and is frequently represented on one side of Hermes on small bronzes, with the cock on the other. The tree, of which part is visible overshadowing the top of the right-hand

pillar, indicates the vegetation that surrounds the whole, and points to Hermes as the protector of pastures. The skill with which all these attributes are combined in this restricted space and tend to give life and symmetry to the whole composition points to a silver-worker of no ordinary artistic capacity.

This medallion was found separated from the body of the patera, and was subsequently fitted into it. A circular rim with the inscription, DEO. MERC. IVL. SIBYLLA D. S. D. D. (*de suo dat dedicat*), was also added. Though this dedication most probably belongs to the patera, there is no doubt that it is of later date than the emblemata. There can be no doubt that the artists in such silver-work made merely the emblemata, or medallions, which they furnished to the commoner silversmiths, who soldered them into the body of such a plate. Such medallions are actually mentioned by Pliny, and that the separate working of the ornamental parts was practiced in antiquity is evident when we find that even in the lower phases of art this was the case. So the Gorgon's head on the center of a shield was beaten out of a separate piece and fastened to the front, as is evident from the passage in Aristophanes, in which we hear of this medallion flying away from the shield, and even from instances which point to the fact that the central decorated part of vases and lamps was made separately and then fitted into the rest.

The next and most interesting question is: What is the connection between a Hermes from Ephesus and a silver patera from the north of Gaul? or rather, since there is an undoubted connection, the one being the original and the other the copy, how can we account for the presence of a comparatively early work from Ephesus on a donation to a temple of Mercury in the north of Gaul belonging to a late Roman period? This would be most clearly accounted for if we could assume that the Romans were fond of and preserved old Greek plate as we value *cinquecento* Italian plate; secondly, if such plate was in antiquity chiefly produced at the place where the original model of the figure on the patera was preserved, and if it was customary for such silver-workers to reproduce the designs of the great sculptors and painters, and of such works as the Hermes under consideration in particular.

In our case these circumstances are not only possible, but even the most probable. With regard to the first condition, we learn from Pliny that in his time the art of beating silver had gone out, an art which had reached high perfection in Greece before his time, and had supplied the wealthy Romans with costly ornaments. The works of these old masters

in silver *repoussé* were highly valued, and he mentions exceedingly high prices for some old Greek plate, paid chiefly, as he says, for the antiquity of the work, so that sometimes these were valued highly even if the design was almost entirely effaced. We shall therefore not be astonished to find early Greek work in a late Roman community. With regard to the second point, we find that Pliny mentions among these famous Greek *repousseurs* a great number who were from Ephesus, the works of the greatest of whom, Mentor, were destroyed in the destruction of the temple of Artemis at Ephesus. With regard to the third point, we learn that Mys, the most famous metal-worker after Mentor, executed his works in silver chiefly after the design of the painter Parrhasius of Ephesus. But the most important information in this respect is that given by the New Testament in the Acts of the Apostles (xix. 23, etc.), from which we learn that the profession of silversmith was the most widely spread at Ephesus, and that great gain came to them from the production in silver of small copies of the temple (*ναός*) of Artemis. Now it is on the drum of a column of this very temple of Artemis that the relief of Hermes is found, which is the prototype of that on the patera of Bernay.

It might be urged that our medallion is not of original Ephesian work, but is a later copy from some early silver-work. This is possible, but surely not probable. That the silversmith who made the medallion had the drum of the pillar from the temple of the Ephesian Artemis or some representation of it before him, is clear to every archæologist; and there is no reason why we should have to introduce other intermediate works of the same kind, when its connection with the Ephesian relief is undoubted, and when we bear in mind that Ephesus was in an earlier period, as well as in the time of Paul, the home of silver-work, and that the later Romans valued and preserved this ancient Greek work as being ancient and Greek. The Ephesian silversmiths were continually employed in making miniatures of this very temple. Now when they had to make a medallion to such a silver plate, they would naturally place on it one of the figures which they were in the habit of producing. They would be largely employed in producing objects in silver besides the miniatures of the temple, and I believe that such silver vessels and ornaments (mentioned in the treasures of other ancient temples) are referred to in the inscription of Salutaris alluded to in the first part of this paper.

It is not often that the far-reaching results of a simple application of the comparative

study of style become so palpably visible and appreciable as in the case of this identification. Nor are there many instances in which the poetry which accompanies a special study, popularly reported to be "dry as dust," so forcibly impresses itself upon us. The recognition of certain facts before unrecognized, and the establishment of truth within a certain group of things and their relation, is no doubt in itself the immediate and supreme aim of research. Yet it is none the less refreshing occasionally to cast a side-glance at the artistic aspect of what has been sought simply for the truth's sake, and to see the poetry that surrounds the discovery of truth.

We cannot but be impressed with the amount of history that seems to be condensed into the narrow compass and the material forms of this small plate. Its form and its history are large chapters of the world's history in miniature,—unverbal, without letters, lines, and pages.

It contains a Greek Hermes, reproduced by an Ephesian silversmith, from the temple of Artemis of Ephesus, valued highly for its origin and antiquity by some noble Roman, who followed the sweep of his empire's conquests, and whose wife in the far north of Gaul dedicates it to the Latin Mercury. It affords an actual tangible illustration of a passage in the New Testament; thus bearing in itself some immediate relation to the worship of the Hellenes, the Romans, and the Christian world. Who knows what use it served at feasts, religious or domestic, in antiquity, and what tales it could tell!

And then it was buried for centuries in the treasury of Mercury of Canetum, whose temple Cæsar saw, through all the middle ages, while the hoof of a knight's horse may have trodden over its crypt, quietly resting unchanged while dynasty followed dynasty, and the French Revolution swept over the country, until a Norman peasant in the nineteenth century, plowing his soil to raise corn to be sent to Paris or some foreign market, comes upon it and unearths it, and it finds its place in the Museum in the Rue Richelieu. What a mass of associations, different in character, in time, and space, are gathered in the center of this plate!

We may be allowed for once to feel gratified at the power of the simple application of systematic observation, which can pierce through the mist of over two thousand years, can baffle the complex maze of the changes of history, and of hundreds of miles of distance, in tracing a plate found in the nineteenth century in the north of France back to its origin in a time preceding the Christian era in Ephesus of Asia Minor.

Charles Waldstein.

CLEVEDON CHURCH.*

“They laid him by the pleasant shore,
And in the hearing of the wave.”
In Memoriam, XIX.

WESTWARD I watch the low blue hills of Wales,
The low sky silver-gray ;
The turbid Channel, with the wandering sails,
Moans through the winter day.

There is no color, but one ashen light
On shore and lonely tree ;
The little church upon the grassy height
Is gray as sky or sea.

But there hath he who won the sleepless love
Slept through these fifty years ;
There is the grave that hath been wept above
With more than mortal tears.

And far below I hear the Severn sweep,
And all his waves complain,
As Hallam's dirge through all the years must keep
Its monotone of pain !

.

Green hills, gray waters ! As a bird that flies,
My heart flits forth from these,
Back to the winter rose of Northern skies,
Back to the Northern seas.

And lo ! the long waves of the ocean beat
Beneath the Minster gray,
Chapels and caverns worn of saintly feet
And knees of them that pray.

And I remember how we twain were one,
By the North ocean dim ;
I count the years gone over since the Sun
That lights me, lighted him ;

And listen for the voice that, save in sleep,
Shall greet me not again ;—
Then, far below, I hear the Severn sweep
And all his waves complain.

CHRISTMAS, 1885.

Andrew Lang.

TOPICS OF THE TIME.

The American Militia.

THE importance of the militia in our political and social system has several times been noticed in THE CENTURY. The new development of the American militia system was described in "Topics of the Time" for June, 1884; and the necessity and propriety of early action by Congress were stated in our latest issue.* Since the former article was written, the development which it forecasts has gone on with so much rapidity that it deserves attention here in connection with the more recent article.

The American of the present day hears continually of the "National Guard," and he may come to believe that the body which bears that name is that to which the Constitution refers as "the militia of the United States." It may be well, then, to remind him that the National Guard is a purely voluntary outgrowth of the Constitutional militia, which was intended to be a universal and compulsory service. When the Constitution empowers Congress to provide for calling "the militia" into the service of the United States, it is well to remember that the term "militia" covered, and was meant to cover, all the fighting-men of the country; and the use of the term in this way shows that, even in 1787, the framers of the Constitution had anticipated the modern German system of universal compulsory military service. It must be admitted that the principle is logically essential to a democracy. Upon it hangs more than half of Jefferson's famous summary of the democratic programme—that "every one who fights or pays shall vote." Without it, we could only conclude that only those who pay shall vote, unless we could fall back upon the somewhat vague doctrine of the diffusion of taxation to show that most people pay something and hence should vote. To get any definite basis for a democracy, it is essential that the popular consciousness should be kept awake to the physical basis of the ballot, the necessity of a return in some form, whether of money support or of a physical support to the government; and that any present exemption from active service should be clearly understood to be a privilege, not a right.

Every indication from our early history goes to show that, if the political geography of the young republic had been the same as that of Prussia in 1860, the result would have been the same; and that the United States would have had a *Landwehr* and *Landsturm* before Bismarck was born. Circumstances, however, were propitious to the American republic. It had no neighbors powerful enough to make the *Landwehr* a practical necessity; and the mass of its citizens were spared all personal contact with the pomp and circumstance of glorious war. For a time there was a survival of the original idea of universal compulsory service in the annual training-days of "the militia," of which Corwin's vivid sketch has left us so clear a description. In course of time even this survival be-

came obsolete, and "the militia of the United States" has now become as purely a census term as the population between twenty-five and thirty, or the population according to latitude.

Instead of the militia, as it was originally intended to be constituted, there has grown up in most of the States a purely voluntary service, the so-called National (or State) Guard, composed of citizens who volunteer to serve the State for a longer or shorter time. Under extraordinary circumstances the persistence of the original idea is shown by the Draft Act of 1863; but under ordinary circumstances the duties of the real "militia" are now performed by this part of their number who have voluntarily assumed the burden. It is thus a fact that the so-called National Guard is now in practice the militia of the United States; and, while the voluntary nature of the force may create certain embarrassments, it must be looked to for the present as the American militia. Of course the disappearance of the original militia organization has not deprived the United States of the right to call upon the State for its quota of "the militia"; while the State may satisfy the call by the services of its voluntary militia. It is evident that there is here the germ of a future voluntary army, closely similar to that which sprang so suddenly into existence in 1861.

In the development of this germ the good offices of the United States have been practically nothing. Some of the Eastern States have done good work of late years. The railroad riots of 1877 were a cogent lesson to Pennsylvania, and the lesson seems to have been taken to heart. Some of the neighboring States have also entered in earnest upon the work of fostering the efficiency of the National Guard, and have made it a force of far greater possibilities in action than was the case ten years ago. But it remains true, as it was ten years ago, that the mass of our States care very little for the proper development of their volunteer militia. Indeed, why should they care for it? Under the present system, the conditions for a sound National Guard only come into existence when population has become dense, and when there is a sufficiently large portion of the population inclined by fondness for military experience to endure voluntarily the obvious discomforts of the service. In States where these conditions do not yet exist, there may be need for an efficient National Guard, without the possibility of it. The need is not evident enough to induce the State to take the only road to a provision for it; and the State goes on in the old shiftless way, growing more prone at every emergency to look for protection to the Federal Government, instead of relying on its own resources. In most of our States the annual provision by Congress constitutes the bulk of the appropriation available for the support of the National Guard, and this provision is inexcusably meager, too small, at any rate, to be any basis for a claim by Congress of a right to enforce a strict regimen on the force which subsists on it.

Nothing can be more evident than that, in the

* "Is Society Ready?" Topics of the Time, THE CENTURY for October, 1886.

States where population is not yet dense, Congress alone can properly develop a real National Guard. It can do what hardly any power could induce the State Legislature to do; it can appropriate an amount large enough to insure a thorough summer encampment by giving a reasonable payment to the men. Experience has shown that the encampment training is an essential to any effective system. It is carried on in many of those States having a uniformed National Guard, but almost always under great embarrassments and for too brief a period for want of funds. In some States, the men have served without pay and even paid their own expenses while in camp, and in almost all the States the member of the Legislature who should vote for the appropriation which is really necessary for that purpose would have an unhappy quarter of an hour on meeting his constituents to explain. And yet the men should be paid for the time spent in the work; and any parsimonious policy in this matter is not even tolerable. The National Guard is as much in the service of the State as the Fire or Police departments are in the service of the city; its possible service is much more unpleasant; and it has fully as much claim to adequate compensation. Some of the States, but by no means all, are able to afford this. If we wish a thoroughly trained National Guard in *every* State, we must look for it to Act of Congress.

The appropriation of a sum large enough to arm and equip the National Guard thoroughly, and to pay the men for the time spent in the annual training or for any other service rendered to the United States, would be a foundation for a larger oversight of the National Guard by Congress. The administration of "the discipline prescribed by Congress," and the appointment of the officers, must remain with the States; but Congress would have a fair right to insist that its War Department should be satisfied, through its inspecting officers, that the discipline was properly carried out. The mere presence of United States officers has a bracing effect upon the officers of the National Guard, and it is nowhere more necessary. The story of the militia officer who kept his men under a fire of bricks and stones for ten minutes, while he turned over the pages of his hand-book in search of the proper order, may be altogether apocryphal. But the deep cut at Reading, Pennsylvania, through which a militia genius marched his men, exposing them helplessly to the fire of the mob above, is still to be seen of all men who travel by rail from Philadelphia to or through Reading; and it testifies that it is sometimes better to have no men than to have some officers.

The reform which has been the first to be carried through by the States which have begun to develop their National Guard has been a comparatively simple one, but one of wide effects, and not easy to accomplish. Under the voluntary constitution of the National Guard, the uniforms were about as various as the companies. Under the new system, the service uniform and equipments of all the regiments of a State's force are to be identical throughout. How difficult it was to extirpate the reds and blues and yellows, the varieties in style and caliber of weapons, perhaps some of the self-sacrificing men who have given their time and attention to the work can tell us; but the results have been all for good. A riotous mob can no longer distinguish one regiment or company from another by its

uniform, or pick out off-hand the particular company from which it believes that there is comparatively little danger. Uniformity gives the sense of discipline to the men and a business-like air which creates respect. Similarity of uniform is a large factor in securing safety to militia, when employed in distant parts of its own State. When the time comes, if it shall come, that militia of one State must be employed in another as in 1794, nothing but a *national* uniformity of equipment will make the step even a reasonable experiment. Evidently, in the course of development into which circumstances have forced us, national action and national development are the only legitimate lines to choose.

The immediate answer to all the line of argument here relied upon, would be that the step proposed would have a strongly centralizing tendency, throwing more power into the hands of the Federal Government. So it may seem on the surface; but in reality the tendency is directly the reverse. Affairs have drifted in such a direction that, while all the States need home protection, only a few are able to provide it for themselves. When the emergency comes, the helpless State naturally looks to the Federal Government for protection, and relies progressively less upon herself. The plain drift of such a policy is to a necessarily strong central government, with a powerful standing army, and the disappearance or absorption of the militia, as we now have it. The development of our National Guard system, an entirely unobjectionable system of volunteer State forces, is simply the encouragement of individual States to rely on themselves. It is thus a National Guard in the complete sense of the adjective under our complex system, an effort by the Federal power to enable the States to carry on the normal operations of the social system. The bill which seems to come nearest to the measure of the national duty, the Sewell Bill, increasing the militia appropriation, passed the Senate at the last session without opposition. It did not reach consideration in the House of Representatives, but still hangs there, ready for consideration and passage in December. The duty of the House in the premises seems plain; and it is to be hoped that one of its first steps will be to take up, consider, and pass the Sewell Bill, as the lowest limit of the national obligation to the National Guard.

The Congressional Balance-sheet.

ECONOMY, says the proverb, is wealth; and though it ill becomes a great people to follow a cheese-paring policy with its government, to scrutinize its cost too closely, and thus compel it to study petty retrenchments instead of great national interests, there is still a certain proportion of results of government to cost of government which even the greatest of peoples is bound to insist upon. If results are great, the people can well afford a considerable expenditure; if results are *nil*, the cheapest of governments is dear at the price; if results are *nil* and expenditure generous, the government is worse than useless. The forty-ninth Congress, whose second session begins next month, closed its first session, August 5, 1886, having begun it December 7, 1885. In order to direct public attention to the results of the coming second session, it may

be well to compare the cost with the results of the first session of the same body. It should be borne in mind, however, that the first session had as near as may be eight months of "work," while the second session will have but a scant three months.

In arranging the debit side of such a balance-sheet, the appropriations for the fiscal year, ending June 30th, may stand as the cost of the session. If, on the one hand, they err in giving appropriations not fully expended, the error will be more than balanced by deficiencies due to the continuance of the session beyond the end of the fiscal year. The statement of the cost of Congress, as given below, errs, if at all, in being too small. The appropriation bills make it as follows :

SENATE: Pay of Senators.....	\$ 380,000.00	
Mileage.....	33,000.00	
Pay of employees.....	344,113.10	
Contingent expenses, stationery, etc....	109,970.00	
HOUSE: Pay of Representatives.....	1,695,000.00	
Mileage.....	110,624.00	
Pay of employees.....	390,849.10	
Contingent expenses, stationery, etc....	114,462.00	
CONGRESSIONAL DIRECTORY.....	1,200.00	
Police.....	36,700.00	
Public Printer.....	18,300.00	
Library.....	59,320.00	
Garden.....	10,700.00	
Cost of Session.....	\$3,310,238.20	

Such being, roughly stated, the cost of the session, let us turn to the credit side of the sheet, the practical results accomplished by this body which costs the country nearly three and a half million dollars a year. They are as follows :

BILLS AND JOINT RESOLUTIONS INTRODUCED :		
In the House.....	10,228	
In the Senate.....	2,974	13,202
BILLS PASSED :		
From the House.....	746	
From the Senate.....	241	987
BILLS PASSED AND VETOED :		
Private pension bills.....	102	
Bills for public buildings.....	6	
Other bills.....	7	115
Bills passed over the veto.....		1
"REPORTS" MADE BY COMMITTEES:		
In the House.....	3,455	
In the Senate.....	1,610	5,065
Pages of "The Congressional Record" filled,		9,000

It would be unjust, as well as impossible, to state any grand total to this side of the Congressional balance-sheet. The reader must look upon the whole mass of "work," and estimate the grand total as seems to him good. It would be unjust, however, both to the reader and to the legislative body, to ignore certain comparative results, for which the first session of the forty-ninth Congress may fairly claim a preëminence over other sessions. Thus, it succeeded in filling about fifty per cent. more pages of that invaluable periodical, "The Congressional Record," than the corresponding sessions of either of the two preceding Congresses. It "introduced," in this one session, nearly twenty-five per cent. more bills and joint resolutions than the two preceding Congresses introduced in both sessions; and the two preceding Congresses were by no means prentice hands at the trade. Its busy and efficient committees made twenty-five per cent. more "reports" in this one session than the forty-eighth Congress made in both sessions, and

fifty per cent. more than the forty-seventh Congress made in both sessions. And it may be added that, for the number and variety of the vetoes placed upon its legislation, this session will rank as without a peer. Such considerations as these must surely reconcile the voter to a balance-sheet as to which he might otherwise complain of the intolerable deal of sack compared to the bread of actual legislation.

About six and a half per cent. of the bills introduced were passed and escaped the veto. It would, however, be quite misleading to leave the impression that even this small percentage constituted any important addition to the country's accumulated stock of legislation. Outside of the regular Appropriation Bills, the Presidential Succession Act, the tax on oleomargarine, the increase of the navy, the Congressional Library Act, a railroad forfeiture, and the Porter Act, the mass of "legislation," achieved by the first session of the forty-ninth Congress was as colorless as a jelly-fish, and of about equal importance. It consisted mainly of private legislation, interesting only to certain constituents of the more skillful members of Congress, and of such "public" legislation as Acts permitting the erection of bridges at specified points, and Acts for the erection of public buildings, interesting only to larger or smaller groups of other shrewd or fortunate Congressmen. So far as really national legislation, business worthy of the time and attention of the legislative branch of one of the most powerful governments of the world, is concerned, the results of the session are sadly inadequate.

The reader may perhaps desire an explanation of this failure of our national Legislative. Let him, then, go to Washington while the two Houses are in session. Let him sit in the gallery of the Senate, provided an "executive session" does not turn him out; let him scan the faces of the Senators, reflect upon their previous records, and consider how many of them came to occupy their present positions. Let him then go and sit for a time in the gallery of the House of Representatives, and watch that national bear-garden. Let him enjoy the usual scene — one purple-faced Representative sawing the air in the progress of what is technically called an "oration"; a dozen or more highly amused colleagues surrounding him; the rest of the members talking at the top of their voices, clapping their hands for pages, writing, reading, telling funny stories and laughing uproariously at them, making social calls from desk to desk, doing anything and everything except the business for which they are paid. Let him try to estimate the rapidity with which a plain business man, finding his clerks engaged in such a scene during business hours, would make a "clean sweep" of them. He will no longer ask an explanation of the Congressional balance-sheet. What better result could be expected from two Houses, each in its own way controlled by influences antagonistic to intelligent legislation? Congress is no longer a legislative body. Its degeneration is now admitted. It consists now of a plutocracy at one end, and a mobocracy at the other. The two chronic perils of a democracy have a firm grip on the Congress of the United States.

Here is no question of comparative guilt or responsibility. Each House is as bad in its way as the other. Nor is there any partisan question involved. The course of Congress has for years been down-hill. Able and sincere men are still to be found in both Houses,

yet each successive Congress is, on the whole, worse than its predecessors; not because Democrats or Republicans control it, but because it is two years further on the road. The rules of the Lower House have been developed with the apparent design of making a familiar acquaintance with them the great requisite for a party leader and of excluding all others from influence on legislation. Pitt or Gladstone would be an enforced cipher in our House of Representatives; and the mass of its members have grown out of the knowledge of or care for legislation. They have long since left all that work to committees; and the session just closed has developed a new feature—an unofficial “steering committee” selected by the majority to regulate the consideration of legislation; in other words, to save the incompetency of the House from exposure. So far as the real business of a legislative body is concerned, the Representatives might fully as well have met and organized in December, chosen their committees, and excused the rest of the members until the committees had done their work for them. By remaining in Washington, an incompetent House is reduced to the ignoble necessity of filling up the intervals with horse-play.

The Congress of the United States has become the most incapable legislative body of the constitutional world. So far as the Senate is concerned, its case is hopeless; the only remedy is outside of it, in the regeneration of the constituencies which elect the senators. The case of the House is somewhat different; its failure may be redeemed by reform within itself. The arguments for the present abominable condition of its committee system rest only on the amount and variety of the business which is introduced and laid before it. But most of this business is petty and utterly unworthy of the Congress of the United States. The great mass of it could easily be remitted to the courts or other permanent agencies, or regulated by general and automatic laws. The really national business could then, as in the earlier days of the republic, be discussed and settled by the House itself. The resistance to such a reform would probably come from the very members who are most injured by the present state of affairs. They have grown accustomed to the husks of legislation. The privilege of “introducing” private legislation, with an occasional sop in the shape of the passage of one of their bills, has become so dear to them that they can hardly give it up. They do not see that they are thus increasing the volume of “introduced” business to such an extent as to tighten the chains of the committee system around the House. It will require some intelligent self-denial and a determined suppression of a good many “leaders,” to bring the House back to its constitutional position as the popular branch of a really national legislative body; and the second session of the forty-ninth Congress could not spend its three months of existence to better purpose than in beginning the work.

The Uses and Dangers of “One Idea,”

MOST men of mature age have been tempted, at some time in their lives, to become “men of one idea” in order to gain that increase of power which devotion to one idea brings. Paul’s summary, “This one thing I do,” is believed in devoutly by many who have no similar reverence for any other of Paul’s summaries. The

prison reformers, from John Howard down, the Abolitionists, the framers and supporters of the Anti-Corn-Law League, the men, who, in England and the United States, have striven to take the civil service from the politicians and preserve it to the people, are familiar examples of the increase of power which man gains by giving himself up to one idea. It is no more than the conversion of all his force into one groove; and if the groove be well chosen, the result can only be to give the man more than his share of influence on the world’s progress.

It should not be forgotten, however, that the largest part of this increase of power is due to man’s retention of control over his dominant idea, to the fact that he utilizes it and does not surrender to it. The man who surrenders control of his thought or judgment to a predominant idea, whether his own or that of another, sees but a part of the case, and the judgment which he bases on it is either inapplicable to the whole or positively injurious. It cannot be preached too strongly, in these times of ours, that it is the characteristic of a well-balanced intellect to look for all the modifying circumstances of a case, as well as the one great circumstance which seems on the surface to control it, and to form a final judgment on the whole; just as universal charity, not the limited affection for one’s immediate dependents, is the characteristic of a well-balanced heart. To deal otherwise with facts is to warp the judgment, and to lose influence over one’s fellows. It need not go much farther to become positively noxious. Let the pursuit of wealth gain predominance as the one idea of a mind or soul, and only fortunate circumstances may be the reason why the result is not theft, swindling, or murder. Whatever be the increase of power which comes from a regulated devotion to one idea, it is easy to show how often fanaticism, lunacy, and crime have their common roots in the *surrender* to one idea, and that there is no quicker road to complete perversion of judgment. Dynamite properly used is power; but it would be folly to carry it in one’s pocket for daily use, and crime to use it for purposes of vengeance.

It is a familiar fact that masses of men often think, judge, and act on the presentation of one idea, and that a surface one. And yet there never has been a time when the fact was more dangerous, when it was more necessary to recall to men’s attention the fact that any wise and useful judgment and action is the resultant of a clear understanding of many correlative, perhaps apparently conflicting forces and circumstances. The citizen sees a policeman clubbing a man evidently in needy circumstances, hears that the offense arose in an effort to resist a reduction of wages by a street-car company, and jumps to the conclusion that it is his duty to side with oppressed labor against capital. He does not see the labor which has been oppressed simply because it has not been organized, which has been dubbed “scab” merely because it is individual labor; he does not see that in this case the real oppression has been that of labor by labor, not by capital. In modern times, when the life of each man is marked by an increasing absorption in a narrow line of work, and a consequently increasing unreadiness to appreciate off-hand the circumstances which are not on the surface, no better service can be done than the consistent preaching of a cautious reservation of individual judg-

ment, a self-diffidence of individual comprehension, until care has been taken to know all the facts of the case under consideration. A well-balanced and powerful public opinion is the sheet-anchor of a democracy. The mischief is done by those who preach only the power of public opinion, and neglect the weightier matters of caution, care, and clear understanding in the make-up of an effective public opinion.

The recent struggle for a national labor organization is a case in point. It is not wonderful that such a scheme should have a strong attraction for minds honestly devoted to the elevation of labor. The annals of legislation among the progressive nations are not pleasant but humiliating reading where they have touched upon the relations of the laboring classes to the rest of the community. The English laws, many of them copied in our own country, forbidding any organization of workmen in self-defense, forbidding any combination for the purpose of striking, attempting as far as possible to regulate wages in the interest of the employer and to reduce the workman to the level of a slave, if not of a brute, are not such laws as our descendants will point to as proofs of their ancestors' humanity or wisdom. They are gone, and it is shameful to think that it is so short a time since they went. But it is singular, also, that so many refuse to see that they are gone, refuse to see in the sudden and easy growth of a great national labor organization the clearest evidence of the complete freedom with which labor in our times may gratify its widest legitimate aspiration. Will any one specify a single point in which American law desires or attempts to limit the liberty of workmen to organize, to act together, to make an injury to one the concern of all? No such point can be specified, for no such point exists. If our law errs, it has been in creating corporations without being sufficiently careful to limit their powers of dealing autocratically with their employees or with the public; and what more powerful agent for the work of pointing out and remedying such errors could be imagined than the national organization to which the laws have given free existence and action? Public opinion has therefore inclined toward the national labor organization, and that largely from a conscientious consciousness of the past oppression to which labor has been subjected. But neither the members of the organization nor public opinion must forget that sympathy with the organization's legitimate aspirations cannot carry sympathy with its illegitimate aspirations, and particularly with any which strike at the state which has acquired for labor its present liberty. It seems difficult for some to understand that public opinion may fairly sympathize with a labor organization in its efforts to repeal unjust laws and to put employer and employee on an equal footing before the law, while refusing sympathy to the organization's assumption of power to punish its enemies through agencies outside of and unknown to the laws. Why should such a modifying circumstance be admitted to consideration? A few sentences from Professor Macy's lately published volume, "Our Government," though meant for other purposes, are applicable here:

"A government may exist and do nothing for the education of youth; it may entirely neglect to provide public highways; it may do nothing for the poor and other unfortunate classes. All these things may be left to other agencies. But there is one duty which the government cannot leave to other agencies. It must administer justice; it must punish the wrong-doer. If the government leaves to another agency the protection of life and property and the punishment of wrong-doers, *then that other agency becomes the government.*"

Here is wholesome truth in a nut-shell, and it constitutes the modifying circumstance which, if neglected by *any* organization, must bring it into conflict with human government and result in the destruction of one or other of them. Would it not be well to regard it in time, and thus preserve the organization for its nobler ends?

If labor has been oppressed in the progressive nations, what shall we say of *all* the weaker classes in other nations? Fools prate of an "indictment of democracy in France"; if democracy all over the world wished to indict the systems of government which it is supplanting, what more horrible indictment could be framed than an ordinary cargo of immigrants from selected regions of the old régime would furnish? We get no such cargoes from the English democracy; and if the American democracy should send out one such cargo from its born and bred members, the world would ring with the description of it. Beaten down by an hereditary system of repression, of artfully contrived taxation, of military service extorted to gratify the ambition of hereditary officers, they come to us with but one idea, that of a "free country." To them, freedom means anarchy. They have never been taught that there are modifying forces to be considered, that the limits of one man's liberty are the rights of other men. That seems to them too much like the submission to the will of an official class from which they have fled. And yet this is the very first lesson which they must learn from their American surroundings; and, as new ideas come through the medium of language, it might almost be admissible to make knowledge of the English language a prerequisite to immigration.

We can no longer shut our eyes to the fact that the American democracy is destined to burdens of which none of its members dreamed five years ago. It must solve new problems for the race, and it must do it, as it has supported other burdens of the kind, soberly, manfully, understandingly. It must, then, study anew the art and practice of considering all the circumstances of a case propounded before giving a deliberate judgment. That frame of mind which is shown in going off at half-cock in a hasty verdict of approval or disapproval on a half view of surface circumstances never was so dangerous as now. There is a new responsibility on our newspapers, on our other periodicals, on our public men, on our clergymen and other teachers, and it behooves them to meet it and to carry on the consciousness of it to the generations which are pressing on for the future. Hence alone can we have that sober and trained public opinion without which democracy is a foredoomed failure.

OPEN LETTERS.

A Siberian Tragedy.

IN the New York "Evening Post" of August 25th appeared the following telegram from London:

"LONDON, August 25.—Alexander Krapotkin, brother of Prince Krapotkin, the translator of Herbert Spencer's works into the Russian language, has committed suicide with a revolver at Tomsk."

As I was perhaps the last West-European or American to see Prince Alexander Krapotkin before his death, circumstances seem to lay upon me the duty of explaining the significance of the brief announcement above quoted, and of giving such facts as are in my possession with regard to a life which ended so tragically, and which seems to me to have been so needlessly and cruelly wrecked.

I made the acquaintance of Alexander Krapotkin in February of the present year at the Siberian city of Tomsk, where I spent two weeks on my way home from the Trans-Baikal. He had then been living in exile as a political offender nearly ten years. Although banished to Siberia upon the charge of disloyalty, Krapotkin was not a nihilist, nor a revolutionist, nor even an extreme radical. His views with regard to social and political questions would have been regarded in America, or even in Western Europe, as very moderate, and he had never taken any part in Russian revolutionary agitation. He was, however, a man of impetuous temperament, high standard of honor, and great frankness and directness in speech, and these characteristics were perhaps enough to attract to him the suspicious attention of the Russian police.

"I am not a nihilist, nor a revolutionist," he once said to me, indignantly, "and I never have been; I was exiled simply because I dared to think and to say what I thought about things which happened around me, and because I was the brother of a man whom the Russian Government hated."

Prince Krapotkin was arrested the first time in 1858, while a student in the St. Petersburg University, for having in his possession a copy in English of Emerson's "Self-Reliance" and refusing to say where he obtained it. The book had been lent to him by one of the faculty, Professor Tikhonravof, and Krapotkin might perhaps have justified himself and escaped unpleasant consequences by simply stating the fact, but this would not have been in accordance with his high standard of personal honor. He did not think it a crime to read Emerson, but he did regard it as cowardly and dishonorable to shelter himself from the consequences of any action behind the person of an instructor. He preferred to go to prison. When Professor Tikhonravof heard of Krapotkin's arrest, he went at once to the rector of the University and admitted that he was the owner of the incendiary volume, and the young student was thereupon released.

After his graduation from the University, Krapotkin went abroad, studied science, particularly astronomy, and upon his return to Russia made a number

of important translations of French and English scientific works into his native language. Finally, he entered the government service, and for a time previous to his exile held an important place in the Russian Telegraph Department. This place, however, he was forced to resign in consequence of a collision with the Minister of the Interior. The latter ordered Krapotkin one day to send to him all the telegrams of a certain private individual that were on file in his office. Krapotkin refused to obey this order upon the ground that such action would be personally dishonorable and degrading. Another less scrupulous officer of the department, however, forwarded the required telegrams, and Krapotkin resigned. After this time he lived constantly under the secret supervision of the police. His brother had already become prominent as a revolutionist and socialist; he himself was under suspicion, his record from the point of view of the government was not a good one, he probably injured himself still further by frank but injudicious comments upon public affairs, and in 1876 or 1877 he was arrested and exiled to Eastern Siberia upon the vague but fatal charge of disloyalty. There were no proofs against him upon which a conviction could be obtained in a formal trial, and he was therefore exiled by what is known in Russia as the "administrative process," that is, by a simple executive order, without even the pretense of indictment, presentment, or hearing.

His place of exile was a small town called Minusinsk, situated on the Yenisei River in Eastern Siberia, two or three hundred miles from the frontier of outer Mongolia. Here, with his young wife, who had voluntarily accompanied him into exile, he lived quietly four or five years, devoting himself chiefly to reading and scientific study. There were in Minusinsk at that time no other political exiles, but Krapotkin found there, nevertheless, one congenial companion in the person of a Russian naturalist named Martiánof, with whom he wandered about the country making botanical and geological collections and discussing scientific questions. To Martiánof's enthusiasm and energy and Krapotkin's sympathy and encouragement Minusinsk is wholly indebted for its really excellent public museum, an institution which is not only the pride of all intelligent Siberians, but is likely, through an illustrated catalogue now in course of publication, to become known to naturalists and archæologists in Europe and the United States.

During the long series of tragic events which culminated in the assassination of Alexander II., Siberia filled up rapidly with political exiles, and the little town of Minusinsk had to take its quota. With the arrival of these new-comers began a stricter system of police supervision. As long as Krapotkin was the only political exile in the place he was allowed a good deal of freedom, and was not harassed by humiliating police regulations; but when the number of "politicals" increased to twenty, the difficulty of watching them all became greater, and the authorities thought it neces-

sary, as a means of preventing escapes, to require every exile to report himself at stated intervals to the chief of police and sign his name in a book kept for the purpose. To this regulation Krapotkin refused to submit. "I have lived here," he said to the *Ispravnik*, "nearly five years and have not yet made the first attempt to escape. If you think that there is any danger of my running away now, you may send a soldier or a police officer to my house every day to watch me; but after being unjustly exiled to Siberia I don't propose to assist the government in its supervision of me. I will not report at the police office." The *Ispravnik* conferred with the Governor of the province, who lived in Krasnoyarsk, and by the latter's direction told Krapotkin that if he refused to obey the obnoxious regulation he would be banished to some place lying farther to the northward and eastward, where the climate would be more severe and the life less bearable. Krapotkin, however, adhered to his determination and appealed to General Shelashnikov, who was at that time the Acting Governor-General of Eastern Siberia and who had been on terms of personal friendship with Krapotkin before the latter's banishment. General Shelashnikov replied in a cool, formal note, insisting upon obedience to the regulation and warning Krapotkin that further contumacy would have for him disastrous consequences. While this appeal was pending, General Anutchin was appointed Governor-General of Eastern Siberia, and, as a last resort, Krapotkin wrote to his aged mother in St. Petersburg to see Anutchin previous to the latter's departure for his new post and present to him a petition in her son's behalf. When the aged and heart-broken mother appeared with her petition in General Anutchin's reception-room she was treated with insulting brutality. Without reading the petition Anutchin threw it violently on the floor, asked her how she dared come to him with such a petition from a traitor to his country, and declared that if her son "had his deserts he would be cleaning the streets in some Siberian city under guard, instead of walking about at liberty." For this brutal insult to his mother Krapotkin told me that he was afraid he should kill Anutchin if he ever happened to see him.

By this time all of the other political exiles in Minusinsk had submitted to the new regulation and were reporting at the police office, and Krapotkin was notified by the *Ispravnik* that if within a stated time he did not follow their example he would be banished to Turukhansk, a wretched settlement of twelve or fifteen houses, situated in the province of Yeniseisk, near the coast of the Arctic Ocean. Krapotkin, however, still adhered to his resolution, and after a terribly trying interview with his wife, to whom he was devotedly attached, he succeeded in extorting from her a promise to return to European Russia with their young child, and let him go to Turukhansk alone. What this promise cost them both in misery I could imagine from the tears which suffused their eyes when they talked to me about it. At the last moment, however, while Mrs. Krapotkin was making preparations to return to European Russia, she happened to see in the "Siberian Gazette" a letter from some correspondent—a political exile, I think—in Turukhansk, describing the loneliness, dreariness, and unhealthfulness of the settlement, the Arctic

severity of the climate, the absence of all medical aid for the sick, and the many miseries of life in such a place. This completely broke down the wife's fortitude. She went to her husband, convulsed with sobs, and told him that she would send her child to European Russia, or leave it with friends in Minusinsk, but go with him to Turukhansk she must and should—to let him go there alone was beyond her strength. "After this," said Prince Krapotkin, "there was nothing for me to do but put a pistol to my head or yield, and I yielded. I went to the police office, and continued to report there as long as I remained in Minusinsk."

I have related this incident in Prince Krapotkin's Siberian life partly because it seems to have first suggested suicide to him as a means of escape from an intolerable position, and partly because it is in many ways an index to his character. He was extremely sensitive, proud, and high-spirited, and often made a fight upon some point which a cooler, more philosophic man would have taken as one of the natural incidents of his situation.

About two years ago Prince Krapotkin was transferred from Minusinsk to Tomsk, a change which brought him a few hundred miles nearer to European Russia, but which in other respects was not perhaps a desirable one. When I saw him in February he was living simply but comfortably in a rather spacious log-house, ten minutes' drive from the European hotel, and was devoting himself to literary pursuits. He had a good working library of two or three hundred volumes, among which I noticed the astronomical works of Professors Newcomb and Holden, Stallo's "Concepts of Science," of which he expressed a very high opinion, several volumes of Smithsonian Reports, and forty or fifty other American books. His favorite study was astronomy, and in this branch of science he would probably have distinguished himself under more favorable circumstances. After his exile, however, he was not only deprived of instruments, but had great difficulty in obtaining books; his private correspondence was under control, and he was more or less constantly disquieted and harassed by police supervision and searches of his house; so that his completed scientific work was limited to a few articles upon astronomical subjects, written for French and German periodicals. He was a fine linguist, and wrote almost equally well in French, German, or Russian. English he read easily but could not speak.

On the last day before my departure from Tomsk he came to my room, bringing a letter which I had promised to carry for him to one of his intimate friends in Western Europe. With the keen sense of honor which was one of his distinguishing characteristics, he brought the letter to me open, so that I might assure myself by reading it that it contained nothing which would compromise me in case the Russian police should find it in my possession. I told him that I did not care to read it, that I would run the risk of carrying anything that he would run the risk of writing—his danger in any case would be greater than mine. He thereupon seated himself at my writing-table to address the envelope. We happened at the moment to be talking of his brother, Pierre Krapotkin, and his pen, taking its suggestion from his thoughts, wrote automatically upon the envelope his brother's name instead of the name

of the person for whom the letter was intended. He discovered the error almost instantly, and tearing up the envelope and throwing the fragments upon the floor, he addressed another. Late that evening, after I had gone to bed, there came a knock at my door. I opened it cautiously, and was confronted by Prince Krapotkin. He was embarrassed and confused, and apologized for calling at that late hour, but said that he could not sleep without finding and destroying every fragment of the envelope upon which he had inadvertently written the name of his brother. "This may seem to you," he said, "like absurd timidity, but it is necessary. If the police should discover, as they probably will, that I visited you to-day, they would not only examine the servants as to everything which took place here, but would collect and fit together every scrap of waste paper found in your room. They would then find out that I had addressed an envelope to my brother, and would jump at the conclusion that I had written him a letter, and had given it to you for delivery. How this would affect you I don't know, but it would be fatal to me. The least I could expect would be the addition of a year to my term of exile, or banishment to some more remote part of Siberia. I am strictly forbidden to communicate with my brother, and have not heard directly from him or been able to write to him in years." I was familiar enough with the conditions of exile life in Siberia to see the force of these statements, and we began at once a search for the fragments of the envelope. Every scrap of paper on the floor was carefully examined, but the pieces which bore the dangerous name, "Pierre A. Krapotkin," could not be found. At last my traveling companion, Mr. Frost, remembered picking up some torn scraps of paper and throwing them into the slop-basin. We then dabbled in the basin for twenty minutes until we found and burned every scrap of that envelope upon which there was the stroke of a pen, and only then could Prince Krapotkin go home and sleep. "Two years hence," he said to me as he bade me good-night, "you may publish this as an illustration of the atmosphere of suspicion and apprehension in which political exiles live. In two years I hope to be beyond the reach of the Russian police." Poor Krapotkin! Less than two years have elapsed, and his hope is already realized, but not in the way we then anticipated.

When I kissed him good-bye on the following day he was full of anticipations of freedom and a new career outside the limits of Russia. His term of exile would have expired in September of the present year, and it was his intention to go at once to Paris. His only fear was that at the last moment an addition of two or three more years would be arbitrarily made to his term of exile. That, he admitted, would be a terrible blow to him, because he had nearly exhausted the little money which remained from the wreck of his small private fortune, and he could not support his family upon the pittance of three dollars a month which is the allowance made by the government to political exiles in Western Siberia.

The evil which he dreaded probably came upon him. I have no information as to the circumstances which brought about his suicide, but there would seem to be little doubt that late in August he was informed that he would not be permitted to return in September to European Russia, and that, in a fit of despair, he

took his own life. It would be easy for such a man, in the bitterness of his disappointment, to reason himself into the belief that his wife and children would be better off without him than with him, and when once this morbid belief had taken possession of him, there would be little to restrain him from suicide. In Prince Alexander Krapotkin's death Russia loses an honest man, a cultivated scholar, a true patriot, and a gallant gentleman.

George Kennan.

Time-Reckoning for the Twentieth Century.

IS THERE not a necessity for reform in our system of time-reckoning? Scientific authorities and railway managers are pretty generally agreed that there is, but they are not sure that the public is prepared for what at first sight may appear too radical changes on use and wont. I am inclined to think that the public is more intelligent and more ready for useful changes than doubters suppose. There is certainly room for reform. According to the system of local time, there are in the world as many different days as there are meridians round the circumference of the globe.

"These days overlap each other, but they are as perfectly distinct as they are infinite in number. There are no simultaneous days on the earth's surface, except those on the same meridian, and as the different days are always in the various stages of advancement, difficulties must necessarily result in assigning the precise period when an event takes place. The telegraph may give the exact local time of an occurrence, but it will be in disagreement with the local time on every other meridian around the earth. An event occurring on any one day may on the instant be announced in a locality where the time is that of the previous day, and in another locality where the time is that of the following day. About the period when the month or year passes into another month or year, an occurrence may actually take place, according to our present system of local reckoning, in two different months or in two different years. Indeed, there can be no certainty whatever with regard to time, unless the precise geographical position be specified as an essential fact in connection with the event described. Under these circumstances it must be conceded that our present system of notation is most defective. Certainly it is unscientific, and possesses every element of confusion. It produces a degree of ambiguity which, as railways and telegraphs become greatly multiplied, will lead to complications in social and commercial affairs, to errors in chronology, and to litigation, and will act as a clog to the business of life, and prove an increasing hindrance to human intercourse."

Thus argues Mr. Sandford Fleming, who has done so much to press this subject on the attention of the world, in a memoir read by him before the Royal Society of Canada, in May last, and prepared for publication in the Smithsonian Institution Reports. To show how unscientific is the system of reckoning time by our position on the earth's surface, we have only to reflect that every meridian converges at the pole. If we ever get there, we can take our choice between the days of Berlin, Paris, London, New York, Winnipeg, San Francisco, Peking, Calcutta, and as many others as we like, and live at the same moment of time in the different hours, days, months, or years of different places. What a blissful place for the Irishman who pathetically complained that he wasn't a bird, and therefore could not be in two places at once!

The present system has human inertia on its side, and nothing else. It leads to loss of time and loss of

life. It subjects travelers and men in business in particular to innumerable annoyances and perplexities. It is altogether unsuited to an age of railways, telegraphs, and submarine cables. What is needed to secure a perfect system? Simply this, that as we have in the revolution of the earth on its axis a standard of time accepted by all men, all should agree on a zero or prime meridian from which the revolutions are to be counted, and accept a common subdivision and a common notation by which parts of the revolution shall be known by all. Canada and the United States have already taken important steps in this direction. By the scheme of hour meridians, the days in North America, which formerly were as numerous as the number of places that observed their own local time, have been reduced to five. We have thus recognized the absurdity of each town, State, or Province choosing its own zero, and maintaining a separate reckoning. This reform was accepted by the people with a unanimity and promptitude that ought to show that the nineteenth-century public may be trusted. A more important step was taken when the President of the United States, influenced largely, I believe, by President Barnard of Columbia College, invited delegates from all nations to a scientific conference at Washington to consider the subject of time-reckoning.

At this International Conference, which met in the autumn of 1884, and at which twenty-five nationalities were represented, Greenwich was accepted as the most expedient zero, and a proposal for a universal day, to begin for all the world at the moment of mean midnight of the initial meridian, and the hours of which should be counted continuously from zero to twenty-four, was adopted.* The advantage of having the day unbroken will be appreciated by travelers who have puzzled over railway guides and been particularly baffled by the A. M's and P. M's. They will be glad to know that a special committee of the American Society of Civil Engineers has announced (January, 1886) that one hundred and seventy-one managers and officers of railways in the United States and Canada have declared their readiness to abandon the division of the day into half-days, known as ante and post meridian, and to accept the numeration of the hours in one series from midnight to midnight. The Canada Pacific Railway has actually adopted the twenty-four-hour system on its main line and branches between Lake Superior and the Pacific. Mr. Fleming now suggests the beginning of the twentieth century as the best starting-point for the general adoption of the cosmic day of twenty-fours counted continuously.† The only question to be asked is, Why not sooner, if it must be soon or late?

It has been objected that this universal or cosmic day may be accepted for scientific purposes, but that it would never do to change the hours to which we have been accustomed in ordinary life for ordinary uses; that, for instance, it would be impossible for us to associate noon with seven o'clock instead of twelve. But such persons forget that no thing, no fact of nature, would be changed, and that it is not a law of Heaven that noon should be known as twelve o'clock. Sunrise and sunset, dawn

and noon, "early candle-lighting," as our fathers denominated the gloaming, and bed-time, would come as usual. Only the numbers of the hours with which we have associated those facts would be changed, and in an incredibly short time we would become accustomed to the change. In some countries the day is divided into four parts. To the people in whose minds noon is associated with six o'clock, it must sound very oddly when twelve o'clock is used as the equivalent for noon. In ancient times each nation had its own chronology, just as it had its own language, laws, and religion. When the Roman Empire became practically coextensive with the world a general system of chronology was required. Hence the introduction of the Julian Calendar, which, with the rectification made under the direction of Pope Gregory, has regulated the Christian centuries. But, like everything else, the Gregorian Calendar itself is now seen to be antiquated. It is unsuited to modern facts and conditions. The world is much larger than when Rome spoke "*urbi et orbi*," and, thanks to steam and electricity, it is at the same time much smaller. New discoveries and inventions are annihilating space, and everything that interferes with the full recognition of the unity and solidarity of the race must be shaken and disappear. "If," says Mr. Fleming, in the memoir from which I have already quoted, "the reforms of 46 B. C. and 1582 A. D. owed their origin to the dominant necessity of removing confusion in connection with the notations which existed in the then conditions of the human race, in no less degree is a complete reform demanded by the new conditions which are presented in this age. The conclusions of the Washington Conference make provision for the needed change, and they will in all probability be held by future generations to mark an epoch in the annals of the world not less important than the reforms of Julius Cæsar and of Pope Gregory."

QUEEN'S UNIVERSITY, KINGSTON, CANADA.

Genius and Matrimony.

THE literary taste of our day inclines strongly in the direction of personal memoirs, private letters, and biographical and autobiographical sketches. It is not surprising, therefore, that amongst the most widely read books which have issued from the Anglo-American press of late years, we should find those edited by James Anthony Froude, unfolding to a curious public the home life of Thomas Carlyle, and the "Nathaniel Hawthorne and His Wife," by their son, Mr. Julian Hawthorne. The lives of these two men of genius, Carlyle and Hawthorne, disclose such a startling difference of experience on the part of their wives that they may *seem* to preach very different gospels to romantic and ambitious young women. But do they? Mrs. Carlyle, after years of married life, cries from the bitterness of a nagged-out spirit, "My ambition has been more than gratified in Carlyle, and yet I am miserable!" Mrs. Hawthorne, after eight years of daily companionship, and the endurance of trials and comparative poverty more severe than any her English sister had to contend with, writes to her mother: "I never knew such loftiness so simply borne. I have never known him to stoop from it in the most trivial household matter, any more than in a large or more

* The names of the delegates on the part of the United States were Admiral C. R. P. Rodgers, Professor Cleveland Abbe, Commander W. T. Sampson, Louis M. Rutherford, and William Frederick Allen.—EDITOR.

† This suggestion was first made by Prof. Simon Newcomb, in December, 1884.—EDITOR.

public one. . . . Such a person can never lose the prestige which commands and fascinates. I cannot possibly conceive of my happiness, but in a blissful kind of confusion live on."

I recommend the hundreds of women who, having pitied the victim of Carlyle's dyspepsia, and sympathized with her heart-aches under years of bickering and neglect, accepted the dictum, *no woman who looks for happiness in her home life should marry a genius*, to review their decision in the light of Nathaniel Hawthorne's love-letters to his sweetheart and wife; nay, more, let them dispassionately examine the foundations of the unbroken felicity and inward peace of this typical New England home, where "plain living and high thinking" were the habits of every-day life; where, on occasion, *the genius* made the fire for the morning bath or meal, instead of smoking his pipe while his wife scrubbed the kitchen floor; let them notice that both Carlyle's and Hawthorne's muse was shy and sensitive and solitary, and that it was impossible for either of them to associate his wife in his great work; but that, whereas the wife of the Scotchman felt aggrieved and wounded at her exclusion from his inner life, and restive under the menial services she must render her lord and master to protect his enforced seclusion from any outside noise or interruption, the wife of the American went about her domestic duties with a light heart and cheery voice, while her husband wrestled with his vivid thoughts shut up in his darkened room, or pacing the quiet and solitary path between the pines.

To those interested in the subject of genius and matrimony, the writer ventures to suggest an explanation for such conflicting evidence, borne with such pathos and ecstasy by these two charming and clever women,—an explanation which might also point many a moral in circles of our social life where so disturbing an element as genius never penetrates.

The Hawthorne and Carlyle households were organized on totally diverse principles; one was a marriage of heart and mind, entered into seriously, reverently, and in the fear of God; the other was merely an intellectual *mariage de convenance*, and both bore fruits after their kind.

There was between Hawthorne and his wife not only absolute sympathy, but a still rarer quality, to be found in any relation of life, *justice*; she says of him, "It is never a question of private will between us, but of absolute right. His conscience is too high and fine to permit him to be arbitrary. He is so simple, so transparent, so just, so tender, so magnanimous, that my highest instinct could only correspond with his will."

Theirs was a love-match, tested and tried by judgment and self-control both before and after marriage; she did not feel shut out from his interests and work merely because a wooden door separated them during the working hours of the day; she knew that the very inspiration which produced his imperishable contributions to American classics depended for its undisturbed flow on a serene and happy domestic environment which she alone could supply. Hawthorne could not write when he was unhappy or felt that other duties demanded his efforts, and we are told that for one year the embryo of some of his best works lay dormant in his mind, because the only place for his desk in their cramped quarters was the nursery! So he played with

the children while his wife did her share of their common duties, and in the evenings refreshed them both for the weary and dull routine of the morrow by reading Scott, Dickens, or some other favorite author, and bided his time with *faith* that he would be given the needful opportunity to write. Mrs. Hawthorne had as many stitches to take as Mrs. Carlyle, but when Hawthorne thought she had sewn enough for that twenty-four hours, he bid her put down her needle, *this side of fatigue*, and was always "immitigable" when he thought this point was barely reached. In a word, she was necessary to him, to his higher and nobler self, even more than to his economically ordered home; he makes her realize it year by year more perfectly as their life flows on through trials and worries such as come to genius and mediocrity alike, and, woman-like, she is happy.

In the case of the Carlyles, it was on one side a woman disappointed in love marrying from ambition,—which she admits was gratified beyond her utmost expectations; and on the other, the fit and prudent "settling in life" of a selfish Scotchman, who sought in his wife what he certainly found, an economical housekeeper who could pay her proportion into the family exchequer, and a brilliant and vivacious mind that should worthily receive and entertain the numerous visitors of a literary lion. If either member of this nervous and eccentric couple had sprinkled in their daily cup of bitterness a small part of the love which was the daily portion of Sophia Peabody and Nathaniel Hawthorne, the English and American world of readers would have been spared much of what Mr. Frederic Harrison justly calls "an autopsy of the personal and domestic life of a man that has written famous books."

Catherine Baldwin.

The Architectural League of New York.

IN my concluding chapter on Recent American Architecture ("American Country Houses, III.," in the July issue of *THE CENTURY*) I spoke of the Architectural League of New York as a "student-club." But I have since received from one of its members a letter of which the substance is as follows: At the first organization of the League several years ago, it would have been correct to call it a student-club; but such is not now the case. From various causes—chief among them the fact that its rules required too much of its members—it gradually fell into a state of disuse, and may almost be said to have died. Meanwhile many of its original members had outlived their student days and entered upon the practice of their profession, some of them in distant towns. In the autumn of 1885 the committee which had in charge the exhibition of architectural drawings held in connection with that of the Salmagundi Club, came to the conclusion that an annual exhibition of such a kind would be sufficient *raison d'être* for the existence of a permanent Architectural Society. At the same time they learned that the old League was showing signs of renewed vitality, and several among them hastened to unite themselves with it. As now reorganized, the League is practically a new society, embracing architects, sculptors, painters, decorators,—in fact, all who are in any way interested in architecture as an art. "I

write all this," adds my correspondent, "because I think your error" (which he is kind enough to call a "very natural" one) "may give a wrong impression — an impression, too, that we have been most careful to avoid. If we are known as a 'student-club,' it will be detrimental to us; for eventually we hope to get a large membership, and not alone from the ranks of the younger generation."

It is with great pleasure that I now make this correction; for the status of the League, as I now understand it, seems to me an even greater proof of the vitality of the profession and the earnestness and enthusiasm of its members than it seemed when I believed it to be a mere association of youthful students.

M. G. van Rensselaer.

BRIC-À-BRAC.

A Catch.

IF any grace
To me belong,
In song,
Know then your face
Has been to me
A key;
For pitched in this
Delicious tone,
I've known
I could not miss
What music slips
Your lips.

If faults be found
In any line
Of mine,
To mar the sound
Of notes that try
To vie
With yours, my Sweet,
Then, always true,
Do you
The words repeat,
And make sublime
My rhyme!

Frank Dempster Sherman.

A Question of Ethics.

FAIR Mary was my boyhood's flame,
When I was nine and she nineteen;
To all the swains who courting came,
Her ready answer was the same:
"I guess I'll wait for Johnny Green!"

Just what the maid was pleased to mean,
I will not now pretend to claim.
I only know she was my queen;
Nor did another step between
Till I myself nineteen became.

Now I relate the fact with shame;
I cannot think my conscience clean —
But Mary's love appearing tame
In ten years' playing at the game,
I craved her sister Josephine.

A fairer maid was never seen;
A host of lovers cried her fame.
But had I any right to blame
Her wish to wait for Tommy Green,
When that's my little brother's name?

Walter Clarke.

Dreams.

HERE is the cottage, ivy hung,
And here the garden gate,
That softly to my footsteps swung
To find you fruits and flowers among,
My pleasant memoried Kate.

You were a free, fresh girl in teens;
I, old in college airs,
Proposed, you know, by well-known means
To raise you from these humble scenes,
And smooth your unborn cares.

I come back sometimes now and muse
On what had been our fate,
Had you lacked courage to refuse;
Though, as it is, I cannot choose
But thank you at this date.

The place looks old, and people stare
To hear me say it's falling;
You're just as handsome, they declare;
I hope so, — though I should not dare
To risk my dreams by calling.

Yet sometimes as you pass, I trust,
You pause as I am doing,
To free those few bright thoughts from dust,
And wonder what had been with just
A trifle warmer wooing.

Documentary Proof of Self-defense.

PROBABLY no legal phrase in common use is so little understood, and through this ignorance so fruitful of the long, tedious, and expensive litigation which it is said to be the object of law to prevent, as the two harmless-looking words "self defense." In law, the term embraces and describes "all the rights conferred upon the individual to protect by his own acts and agencies his property or his person against some injury unlawfully attempted to be inflicted by another." This definition should be committed to memory by every school-boy in the land. He will then have laid the foundation for a knowledge of the law of self-defense which may be of great value to him in after life.

But the chief difficulty in setting up and proving self-defense in a court is twofold.

First. We must be thoroughly convinced that a great injury to person or property is contemplated.

Second. We must be able to establish by proof that such injury to person or property was so contemplated by the assailant at the time of the self-defense alleged.

In other words, the identity of the assailant, and his sincere desire to do us great injury, either to person or property, must be proved beyond the possibility of a reasonable doubt in the minds of the highly intelligent jury. This is not so easy as at first appears. We must establish by some proof that is free from bias or prejudice that the defendant was just in the act of imbruing his hands in our gore or about to commit a felony when we smote him, as set up in our defense. Therefore the testimony of members of the family would have little weight with an average jury.

For these reasons, which I trust I have made quite clear, it has occurred to me that documentary evidence

would be the best. Supposing that I awake in the night from a sound and innocent slumber to find the bull's eye of a total stranger shining in my eyes. I see that he is ransacking the pockets of my pantaloons. I start suddenly as a wave of horror passes the entire length of the spinal column. The frenzied start squeaks the costly framework of the richly carved couch on which I recline. In an instant the gentleman whips out a small gun, tells me to move at my peril, and with his pockets full of stuff that I have toiled hard for years to accomplish, he slowly egresses. I realize that my wife would not be a competent witness on my behalf, and I have failed to provide other witnesses in my apartments. You know a man cannot think of everything. In fact thousands of men retire every night with absolutely no one as witness or to protect them but their wives, forgetting that as a protector a wife is almost worthless, and as a witness she is even more so.

So I have written out and had printed a large number of blanks, on which appear the following questions with spaces for answers. You wake up in the dead hours of night to find a party in the room engaged in the felony industry. You ask him to be seated, and taking from your writing-desk the blank alluded to, you propound the following conundrums to him, filling in the answers as he gives them :

1. What is your name ?
2. Where do you reside ?
3. What is your age ?
4. Your weight ?
5. Are you married or single; and if so, would your family be left destitute in case I should shoot you in self-defense ?
6. Do you die easy or do you generally cling to life ?
7. Are you a natural-born citizen of the United States or are you an alien ?
8. If an alien, please state whether it is a family characteristic ?
9. Do you use tobacco ?
10. Please state what disposition you would like to have made of your remains in case you should be shot in self-defense.
11. Do you drink ?
12. If so, why will you persist in so doing ?
13. What do you generally take ?
(Intermission.)
14. Do you contemplate the commission of a felony ?
15. If so, state what is your favorite style of felony and your reasons for dabbling in felony ?
16. Is this the first time you have ever taken part in a justifiable homicide ?
17. If not, please state fully where, when, and under what circumstances you took such a part, and whether or not you at that time took the offensive or the defensive.
18. Do you smoke cigarettes ?
19. Please breathe hard on the breath-tester, not necessarily for publication, but for future analysis.
20. Have you ever been insane ?
21. Are you insane now ?
22. Do you ever have microbes on your brain ?
23. If so, do you think that they tend to deterio-

rate the brain tissue, or do you think that they improve it in your case ?

24. Have you any other clothes that you would prefer to be laid out in, aside from those you now wear ?

25. When did you first begin to toil up toward the pinnacle of felony ?

26. What amount of money would you be willing to take in order to forego and, as it were, omit this particular felony ?

27. Would mining stock or ninety-day paper be taken in such a deal ?

28. If unsatisfactory answers are made to both the above interrogations, will you please state fully what medical college you would prefer to endow with yourself ?

29. Is the idea of a personal devil repulsive to you ?

30. Would you please protrude your tongue as far as possible, and hold it there until a physician can be summoned ?

31. Are you an offensive partisan ?

HENRY CLAY.

THE CENTURY MAGAZINE.

VOL. XXXIII.

DECEMBER, 1886.

No. 2.

ASHLAND, THE HOME OF HENRY CLAY.

AMONG the rolling hills of the far-famed blue-grass region of Kentucky, in the midst of a park of fine old forest trees,—ash, oak, and walnut,—Henry Clay built his home and called it Ashland, from the number of trees of that species, and possibly, too, in tender memory of his boyhood home in Virginia, where the “Mill-boy of the Slashes,” the son of an impoverished preacher, first lived the life that he was to make so famous.

In 1797, Clay, then only twenty years of age, left the law office of Francis Brooke, Attorney-General of Virginia, and afterwards Governor, and went to Kentucky, to which State his mother, since her second marriage, had already removed. Lexington, at that time the most considerable town west of the Alleghanies, was the place chosen for location, and here he made his first speech before a debating society, electrifying his hearers, and giving a promise afterwards so brilliantly fulfilled. He soon, to use his own words, “rushed into a lucrative practice,” and was successively elected to the State Legislature and the Senate of the United States.

Thus successful, he was enabled to purchase early in the new century a tract of land a few miles south-east of Lexington, beautifully situated and very fertile. Here, about the year 1809, he erected a handsome brick dwelling-house, which ever afterwards remained to him a beloved retreat from the cares and fatigue of a most energetic public life. In the midst of the stirring scenes in which he was

so conspicuous an actor, his thoughts ever reverted tenderly to his country home and the delights of rural life; and in his private correspondence are found frequent allusions to farm matters—the expression of an eager desire to return to Ashland and devote himself to agricultural pursuits, to test some favorite theory of fertilization, to superintend the rearing of recently imported stock.

The situation selected for the house is a slight elevation, from which the blue-grass slopes stretch in gentle undulations down to the city, some two miles distant, and in full view. In the rear lies an extensive woodland, a remnant of the virgin forest, devoid of undergrowth. The mansion, as originally erected, consisted of a main building two stories and a half in height, flanked on either side by wings the full breadth of the house, though but a single story high, to which are attached L's, projecting to the front. The present mansion does not depart materially from the original plan. The general effect is odd, but not unpleasing; and the numerous gables and chimney-tops are delightfully suggestive of that hospitality for which Ashland has ever been renowned.

The interior arrangement of the house is peculiar, though singularly convenient and charming. The entrance is into a lofty octagonal hall, to the left of which is a small room used by Clay as an office. On the right is the staircase, and directly opposite the front entrance are doors leading into the drawing-room and dining-room, the two apartments connected by a wide, arched doorway. In the northern wing on each side are narrow halls running its entire length, between which is the library, a beautiful octagonal room with a dome ceiling, finished with panels of ash and walnut, and lighted from above. Beyond

the library are a billiard-room and sleeping apartments.

The entire woodwork of the interior is highly polished walnut and ash cut upon the place. In the billiard-room, drawing-room, and the hall behind the library, the windows open to the floor out upon a broad terrace of brick and stone; and in the dining-room and drawing-room, into a large conservatory, beyond which extends a richly turfed lawn, now laid out in a series of tennis courts. The southern extension of the house is devoted entirely to domestic uses.

After Clay's return from Europe, whither he had gone as commissioner plenipotentiary to the Council of Ghent, he bestowed much attention to beautifying the grounds about Ashland, putting into practical use observations made while abroad. His model seems to have been an English country-seat. Owing to the peculiar natural attractions of the place, the intervention of art was but slightly necessary. A park of superb forest trees, sloping lawns, sheeted with the luxuriant blue-grass, which retains its freshness and velvety softness throughout the winter, and a wide-reaching view of the surrounding country

were supplied by nature; so that all remaining for the hand of man was to lay out the grounds and make use of the material so lavishly placed at his command. This was done with great taste and elegant simplicity. From the mountains were transplanted dogwoods, redbuds, pines, hollies, and other flowering and ornamental trees; and handsome shrubs, not indigenous to the country, were dotted about the lawns. Tan-bark walks were laid, heavily shaded by avenues of hemlocks, ashes, and walnuts, their delicate foliage interlacing overhead.

Clay's attendance upon Congress, necessitating long and frequent absences from Kentucky, rendered this work of improvement and adornment very gradual, as he delighted to give to it his personal supervision. But at the close of the session of 1821 he retired from Congress and resumed the practice of his profession, devoting much time to his private affairs, which had become impaired during his long public service. Two years later he returned to Congress.

At the close of Adams's administration Clay once more retired from public life to the shades of Ashland. In a letter to a friend he writes:

ASHLAND.

Engraved by T. Johnson.

After a photograph in possession of Louis E. Levy, Esq.

HENRY CLAY AND HIS WIFE.

HENRY CLAY'S BED, USED BY HIM FOR FIFTY YEARS.

"My journey has been marked by every token of warm attachment and cordial demonstrations. I never experienced more testimonials of respect and confidence, nor more enthusiasm. Dinners, suppers, balls, etc. I have had literally a free passage. Taverns, stages, toll-gates have been generally thrown open to me, free from all charge. Monarchs might be proud of the reception with which I have been everywhere honored."

Notwithstanding this expression of public sentiment towards him, he joyfully returned to his peaceful home and the rural life, to him so full of delights. A month later we find him writing to his old instructor, Governor Brooke:

"I have been much occupied, since my return, with repairs to my house, grounds, and farm. . . . I have not determined to return to the practice of my old profession, and nothing but necessity will compel me to put on the harness again."

Throughout the active correspondence with Governor Brooke, which is of the most intimate character, are found frequent allusions to this subject. April 19, 1830, he writes from Ashland:

"I assure you most sincerely that I feel myself more and more weaned from public affairs. My attachment to rural occupation every day acquires more strength, and if it continues to increase another year as it has the last, I shall be fully prepared to renounce forever the strifes of public life. My farm is in fine order, and my preparations for the crop of the present year are in advance of all my neighbors. I shall make a better farmer than a statesman. And I find in the business of cultivation, gardening, grazing, and the rearing of various descriptions of domestic animals, the most agreeable resources."

Again, a few days later, having been urged to make a political journey to the North, and feeling some desire to do so, he writes to the same gentleman:

"But I believe I shall resist it and remain in Kentucky, where (will you believe it?) I am likely to make an excellent farmer. I am almost tempted to believe that I have heretofore been altogether mistaken in my capacity, and that I have, though late, found out the vocation best suited to it."

Thus it is throughout his entire correspondence, though more particularly in this free, untrammelled intercourse with his beloved instructor. In the midst of the most heated discussions of

the stirring political questions of the day, when his fiery spirit is roused to the utmost, comes the same refrain in clear undertone: "I shall remain more than ever at Ashland, the occupations of which I relish more than ever."

Through this charming medium we catch glimpses of the domestic side of a great man's character, ever most interesting, for in it we trace the kinship of humanity.

In the autumn of 1831 he writes: "I am strongly urged to go to the Senate, and I am now considering whether I can subdue my repugnance to the service." After some hesitation, he finally obeyed the clamorous appeals of his constituents and the dictates of public duty, and in the following winter once more took his place in the councils of the nation, where he remained until the spring of 1842.

During this long period of political activity, a period fraught with questions and issues of the most exciting character, in his private correspondence we continue to read of his attachment to Ashland and the life of a farmer. "Since my return from Washington," he writes to Governor Brooke, May 30, 1833, "I have been principally occupied with the operations of my farm, which have more and more interest for me. There is a great difference, I think, between a farm employed in raising dead produce for market, and one which is applied, as mine is, to the rearing of all kinds of live stock. I have the Maltese ass, the

Arabian horse, the merino and Saxe merino sheep, the English Hereford and Durham cattle, the goat, the mule, and the hog. The progress of these animals from their infancy to maturity presents a constantly varying subject of interest, and I never go out of my house without meeting with some of them to engage agreeably my attention. Then our fine greensward, our natural parks, our beautiful undulating country, everywhere exhibiting combinations of grass and trees, or luxuriant crops, all conspire to render home delightful."

This inventory of live stock upon the Ashland farm renders it almost unnecessary to state that this region of Kentucky, despite its great fertility, is more eminently fitted for the rearing of live stock, owing to the native blue-grass covering its hills with a rich carpet of perpetual verdure. To this branch of agricultural employment Clay devoted himself, more especially during the intermissions of his public career. Among other importations was a very interesting Spanish ass, Don Manuel by name, shipped from Bordeaux in 1835 by Henry Clay, Jr. Don Manuel is represented as a very fine and handsome animal, and as gentle as a dog. His picture is still carefully preserved in the family. Young Clay while abroad also purchased for his father fine breeds of cattle and horses in England, and made an expedition to the Hautes-Pyrénées for the purpose of procuring more animals of that species to which Don Manuel belonged, a species of ass not generally known in America. Thus Ashland became one of the most finely stocked farms in the whole blue-grass district.

While paying special attention to stock-raising, Clay did not neglect the cultivation of the soil. Experiments in agriculture ever possessed interest for him, particularly in the way of fertilization. Hemp, in the production of which Kentucky stands foremost among the States of the Union, also received much of his care; and he wrote a pamphlet upon the subject of its cultivation.

"How did Mr. Clay rank among the farmers of the neighborhood?" inquired the present writer of an old gentleman who was Clay's intimate personal friend and his executor, though his political opponent.

"Oh, none ranked higher," was the instantaneous reply — "except his wife."

This estimable woman, during her husband's long and frequent absences at the seat of government, literally took the reins into her own hands, made a practical study of agriculture, oversaw the overseer, and became an oracle among the farmers of the vicinity. The garden and dairy, which enjoyed her special supervision, were made alone to meet the expenses

of the establishment. And a quaint, delightful spot it is, this old garden, where every spring the daffodils and snowdrops come up and blossom demurely in the first warm days, and the musk-roses flaunt their bright heads the summer long, quite as if they had not been superseded by daintier beauties years ago. It is also related of Mrs. Clay that preparatory to her husband's departure from home she invariably received from him a handsome check, which she as regularly restored to him upon his return, with the laconic remark that she had found no use for it.

At last, in the spring of 1842, Clay executed his long-cherished purpose of retiring from the public service to spend the remainder of his brilliant life amid the peaceful shades of Ashland. With this intention he resigned his seat in the Senate, and the voice of "the old man eloquent" sounded for the last time, as he thought, in the halls whose echoes had been so frequently awakened by its magic. But his devoted people, inconsiderate in their enthusiasm, would not resign him to the tranquillity of private life; and so, ten years later, broken in health, with the snows of three-score years and ten thick upon his brow, he went back to die amid the scenes of his former triumphs.

During the years of his retirement Ashland was, as indeed it had ever been, the shrine toward which many a pilgrim bent his steps. Its doors were thrown open with the most profuse though unostentatious hospitality. Every one went away as much impressed by the simplicity and elegance of the man as by his greatness. After dinner, guests were usually taken out to examine the fine stock, to see some newly imported animal or improved breed of cattle, or to note the result of agricultural experiments — all of which to him were replete with the keenest interest and enjoyment.

Many distinguished persons have been the recipients of the hospitality of Ashland. Lafayette, when in this country in 1824, paid his respects to its hospitable lord, between whom and himself an unbroken correspondence was maintained through many years. Harriet

HENRY CLAY'S INKSTAND.

Martineau also was a guest here, as were many other distinguished foreigners, among them being Lord Morpeth, His Excellency Baron de Maréchal, at one time Austrian Minister at Washington, and Count Bertrand.

On the occasion of Count Bertrand's visit, while sitting at the dinner-table he noticed on

the wall an engraving depicting a domestic scene at Mount Vernon, in which Washington was represented as tracing his campaigns upon a map for the entertainment of his wife. Bertrand instantly instituted a comparison between the American general and Napoleon, saying that neither could have accomplished the feats of the other had they changed places; but at the same time inclining decidedly toward the superiority of Napoleon. "Ah, Count," said Clay, in a quiet tone, touching his heart with his forefinger, "but the *morale*."

Many other celebrated characters, foreign and American, accepted the hospitality of Ashland. Among them may be mentioned the novelist Captain Marryat, Daniel Webster, and General Harrison. The visit of Harrison, which took place some time during the period between his nomination to the Presidency and his inauguration, gave rise to no little scandal in political circles, which was afterwards proved to be utterly without foundation.

After Clay's death Ashland passed into the hands of his son, Mr. James B. Clay, some time *chargé d'affaires* at Lisbon. On the decease of the latter it was purchased for the use of the Kentucky University; but in the last few years it has again come into the family, the present owner being Mr. Henry Clay McDowell, whose wife is a daughter of Henry Clay, Jr., the gallant officer who fell, in the prime of his manhood, at the battle of Buena Vista.

During the occupancy of the house by Mr. James B. Clay, it became necessary to tear it down on account of some defect in the masonry. It was immediately rebuilt on the same plan, the old material being again utilized for the purpose as far as practicable; so the more recent

The Porch
of Ashland.

THE PARK, ASHLAND.

mansion stands an almost exact counterpart of the original. The room formerly used by Clay as an office was restored in the minutest detail.

Since its reacquisition by the family, Ashland has once more taken on its pristine state. Old traditions are tenderly fostered, and the whole place is delightfully redolent of the great man, its founder. His favorite promenade, a serpentine walk wandering along beneath an avenue of pines and cedars, with here and there a redbud or dogwood, where he delighted to stroll in moments of reflection, has been preserved intact; and many other spots are pleasantly associated with his name. His portrait, made when he was a young man, by the celebrated Kentucky artist, Matthew Jouett, hangs in the hall, and another representing him in later life, done by a member of the family, adorns the wall of the drawing-room; while in the library is placed a bust taken from Hart's statue.

The present owner of Ashland has once more converted it into a farm for the rearing of blooded stock, and in its stables may be seen some of the finest trotters in the State. We saw the beautiful creatures as they came home from the fall trotting races, bearing their

blue ribbons along with them, and — but it may have been a fancy — they seemed to carry their graceful heads more proudly since they wore the badges of new victories.

From the front lawn is commanded a fine and extended view of the surrounding country, the domes and spires of the city standing out prominently against the sky, the whole prospect closed within a frame of branching walnut-trees. Slightly to the left of the picture rises a lofty column surmounted by a statue, the outline of which is scarcely visible. This is the Clay monument, erected to the memory of the great statesman by his admirers in the State of his adoption. In the base of the monument are placed two handsome marble sarcophagi, containing the remains of himself and his wife.

The great number of trees about the place, indigenous and exotic, evergreen and deciduous, illustrate Clay's fondness and taste for arboriculture. Lofty pines transplanted from the Kentucky mountains rear their heads majestically. Numerous chestnuts, cedars, hollies, and flowering dogwoods and redbuds, all brought from the mountains, and hemlocks, Norway spruces, larches, and catalpas, combine with the native ash and walnut in

WILLOW SPRING, IN THE PASTURE.

forming umbrageous avenues and small groves about the lawn, the air being fragrant with their resinous odors.

Ashland was indeed the picture of an ideal country-seat, as we saw it when the frost had come and, like a magician, transformed the summer green of its park into a mass of more gorgeous colors, while the crimson and yellow autumn leaves drifted down—perhaps a trifle sorrowfully, for all their brilliant hues—and lay glittering on the soft, blue-tinged sward beneath; and the sleek-coated trotters cropped the grass and formed themselves into

picturesque groups, in harmony with the warm, richly glowing October landscape.

From the neighboring turnpike—and let me say a word in praise of Kentucky highways—Ashland presents no other appearance than that of solid comfort and simple elegance; a place well kept up by people of culture and refinement. Its wide-reaching lawns and woodlands, all in perfect trim, its many gables, and chimney-tops, and outstretched wings, are pleasantly suggestive of that hospitality which has ever reigned within its doors.

Chas. W. Coleman, Jr.

HENRY CLAY.

REMINISCENCES BY HIS EXECUTOR.*

IF it gives an old man any pleasure to recall even the trifles that were of interest to him when the world and its ways were new and

fresh to him, my descendants, I am sure, will not regret that I have here recorded some of them for their entertainment. I feel that I

* The following reminiscences of Henry Clay, by his only surviving executor, were written without any view to their publication, and were intended solely for the perusal of the author's descendants,—in the belief that it would interest them to know something of the confidential relations which existed between Mr. Clay

and the author. Especially it was the wish of the latter to convey to them the impression made upon him by his distinguished friend. It was with difficulty that we were able to convince Mr. Harrison that the world at large would place value upon these authentic and affectionate memorials.—THE EDITOR.

MIRROR FROM ASHLAND, NOW IN POSSESSION OF JOHN M. CLAY, ESQ.

can talk to them of trifles which I would not speak of to the outside world. My chief purpose is to give my recollections of my intercourse with Mr. Clay, which for some years before his death was very intimate and confidential, and exceedingly agreeable to me, and also to give the impressions he made upon me.

My first recollection of Mr. Clay goes back to the fall of 1820; I was then in my seventeenth year, and a member of the junior class in the academical department of Transylvania University, now known as the Kentucky University. Court was in session, and led by curiosity I entered the crowded room. There stood Mr. Barry addressing the jury, and soon afterwards another gentleman behind the bar filled a glass tumbler with claret, and during a pause in Mr. Barry's argument handed it to him, saying as he did so, in a very cheery tone of voice, "I'll treat you, though you are against me." That gentleman was Mr. Clay. Mr. Barry, without manifesting any surprise, drank the claret just as if it were an ordinary occurrence, and went on with his argument. This incident is all that I remember of the whole case, and it fixed itself in my memory because it was something altogether new to me. I had never seen anything of the sort in the courts at home, with which I was

pretty familiar, my father being the clerk of these courts. Mr. Barry, a rare orator, was then the leader of the "fierce Democracy" of Kentucky.

I again saw Mr. Clay in December of the same year, a day or two before Christmas. Being still at school in Lexington, and there being no public conveyance between it and Mount Sterling, my father had come to take me home for the holidays. We were by the fire in the hall of the hotel, when Mr. Clay came in, and seeing my father, he greeted him at once with the familiar air and tone of an old friend, grasped him by the hand, and addressing him by his given name inquired about his health. I was somewhat startled, because I had never before heard any one call my father by his given name; but Mr. Clay's manner and the tones of his voice were so impressive, so natural, and apparently so sincere that my surprise was soon lost in my admiration of the man, and especially as my father seemed to be as much gratified by the meeting as Mr. Clay himself. After some friendly chat Mr. Clay urged my father to spend the night at Ashland, inasmuch as he had much to say to him. My father declined the invitation because, as the roads were in very bad condition and the days short, he

ICE-HOUSE, ASHLAND.

CLAY'S WALK.

would not be able to reach home before dark unless he got an early start in the morning. Then said Mr. Clay, "You of course must have breakfast before starting, and therefore you will lose no time by starting from the hotel at daybreak, and taking your breakfast at Ashland; you know Ashland is directly on your route home." My father accepted the invitation, and though we were at Ashland at an early hour the next morning, we found everything ready to receive us. No one was at the breakfast but Mr. and Mrs. Clay, my father and myself. The subjects talked of were the state of his health, which was not good, and that of his private affairs, which had suddenly become heavily embarrassed by his suretyship for a large amount, which, according to my recollection, he mentioned as being

\$40,000. He said that though he had been absent from Congress during its then session, yet as his health had somewhat improved, and he had succeeded in putting the surety debt on a basis as satisfactory to himself as he had any reason to expect, he hoped to be able to leave for Washington immediately after the holidays, and to be in his seat in the House of Representatives in time to take part in the debate on the question as to the admission of Missouri into the Union as a slave State.

In speaking of this heavy debt and of the uncertain state of his health, and indeed of the general pressure, public and private, then on him, he uttered no complaint and manifested neither despondency nor gloom; on the contrary, he was as bright and as cheery and as buoyant at that early breakfast as he was

THE CLAY MONUMENT, FROM ASHLAND LAWN.

the evening before; and when long years afterwards I got to know him well, I found this hopefulness and buoyancy of temperament were among his most marked and enduring characteristics. They were not only prominently displayed throughout the most stormy and anxious period of his life, say from 1825 to 1842, when he made his farewell address, but they gave a cheering glow to his conversation even when drooping under the heaviness of old age.

My own conjecture is that the large sum of about \$25,000 paid to the Northern Bank in Lexington, many years afterwards, by his friends, and without his knowledge, was in part at least the residue of that surety debt above referred to. Mr. John Tilford, president of that bank, in a published letter now before me, of date Lexington, May 20, 1845, says: "Within the last two months I have received, from various sections of the United States, letters to my address containing money which I was requested to apply to the payment of the Hon. H. Clay's debts, with no other information than that it was a contribution by friends who owed him a debt of gratitude for services he had rendered his country, etc. The amount so received was \$25,750."

"Who did this?" inquired Mr. Clay, with tears in his eyes and in his voice; to which Mr. Tilford replied, "I do not know; it is sufficient to say that it was not done by your enemies."

As Mr. Clay was occupied by his public duties as Secretary of State at Washington, he was at home but seldom between 1825 and 1829; but, on his several visits, the ordinary courtesies between him and myself were observed, and I am gratified by being able to say that my admiration increased with my better acquaintance with him. It is not surprising, therefore, that I took especial care to be present whenever he addressed his constituents, the jury, or the court.

On my marriage, in 1830, Mr. and Mrs. Clay gave the bride and the groom a handsome entertainment. I, however, ascribed the compliment to the fact that the bride was a favorite niece of Mrs. Clay, and that fact no doubt contributed to bring us socially more frequently and more closely together until my removal to Vicksburg in 1835; but after my return from Vicksburg in 1840, and especially after I began housekeeping in 1841, and resumed the practice of law in Lexington in 1842, the social intercourse was renewed not only between our respective families, but

THE HALL.

between Mr. Clay and myself, until, at last, and for several years preceding his death, it ripened into an intercourse of rare confidence and trust, without any special effort on my part to bring it about. Indeed, it came about so naturally that I was never conscious of the precise time of its beginning. It was well known to the public, for instance, that I was never a member of his political party, and about as well known that I always entertained the highest respect and admiration for him; and he was as fully aware of these facts as any of the public. I could say more on this subject, and to the same effect, but probably what I have said is enough to satisfy my descendants that, throughout my whole personal intercourse with him, I maintained my own self-respect by a frank though civil and gentlemanly adherence to the principles of the Democratic party as I understood them. I must say, however, that

when I came to the conclusion, as I did, that General Jackson indorsed, even if he did not originate, the foul calumny of bargain and intrigue between Mr. Adams and Mr. Clay, by which the one secured the Presidency and the other the office of Secretary of State, I was placed by that conviction in a predicament very painful to myself. I, however, after due reflection, kept that matter to myself, and though the General had thereby lost his hold on my personal respect, yet I quietly moved on with the great body of the Democratic party; for I was a Democrat by birth and conviction.

Mr. Clay for several years prior to his death seldom came to town without calling at my office; the fact was indeed so well known that strangers wishing to pay him their respects were often referred to my office, and farmers in the county would often bring to its door a fine horse or a fine colt to exhibit to him.

They knew that he was a breeder of thorough-bred stock of every kind, from the shepherd dog to the high-mettled race-horse; was an excellent judge of all such stock, and as much at home with the horse and horsemen as with senators and in the Senate.

An application to Mr. Clay, made by me in behalf of my son as a candidate for the Naval Academy, was the only personal favor I ever asked at his hands; and had he given me no other evidence of his regard but this, I should feel under lasting obligation to him. I have, however, occasionally made personal appeals to him in behalf of others with whom I had no connection except personal regard, and in such cases I never failed to secure what I applied for.

I never wrote to him in regard to such a matter but once. The post-office in this place became vacant in January, 1852, by the death of the incumbent, a personal and political friend of Mr. Clay. The chief clerk at that time was a Democrat, without being a partisan, and desired to succeed to the place. He was in all respects competent, and had made himself very popular by his conduct in the office. He desired a letter from me to Mr. Clay, recommending him, and I was anxious that he should get the place. I felt, however, that I had no right to press a Democrat upon Mr. Clay. I, however, wrote to him upon the subject, stating the fact of the vacancy, and giving the names of the applicants, all of whom, I said, were his political friends except this gentleman. I said, further, that he had been chief clerk, was in every way competent, and if the question was submitted to the popular vote, he would, as I believed, receive a decided majority over any of his competitors.

Mr. Clay, by his letter of January 26, 1852, informed me that he had conferred with the Postmaster-General, and advised him to appoint my friend, which he had no doubt already had been, or shortly would be, done. On the next day after receiving this letter the commission arrived. This letter was written by an amanuensis, Mr. Clay being then in very feeble health. His signature indicates considerable physical weakness.

My last interview with Mr. Clay was at Ashland, in the fall of 1851, on the day before his departure on his last trip to Washington. I was accompanied on that visit by General John C. Breckinridge and Major M. C. Johnson, then, as now, president of the Northern Bank at Lexington. The day was damp, chilly, and cloudy, and the visit, though very pleasant, was a gloomy one to us all. Mr. Clay was very feeble, though he remained in the parlor with us and accompanied us to the front door, where we bade him good-bye.

He was evidently affected, and, as if feeling, as we all felt, that we would never see him alive thereafter, before leaving the door he touched me on the shoulder, and stepping back a few paces, said in a very quiet voice, "Remember that my will is in the custody of my wife." I was one of the executors of that will. The other two were his wife, Mrs. Lucretia Hart Clay, and the Honorable Thomas A. Marshall, then, and for many years, Judge and Chief Justice of the Court of Appeals of Kentucky. He was a nephew of John Marshall, the great Chief Justice of the Supreme Court of the United States, and one of the purest gentlemen I have ever known. As the testator had requested that no security should be required of us, we all qualified as executors without security. Mr. Clay's health for some months at Washington continued to be about the same as when he left home; but in the spring of 1852 he began to grow daily weaker from a cough which it was impossible to relieve. On the 28th of April, 1852, I received a telegram from him in these words: "Tell Thomas to come as soon as he can."

His son Thomas, of course, immediately left for Washington, and remained there in attendance on his father until his death, on the 29th of June following. Among Mr. Clay's last words, if not his very last, as reported to me by his son, were, "Thomas, I am dying; telegraph Mr. Harrison." That dispatch was received by me a few minutes after his death, and delivered to Mrs. Clay. That I secured the confidence of this illustrious man, and under circumstances somewhat peculiar retained it to his dying hour, is among the most pleasant memories of my long and somewhat eventful life. Though aware of my political status, yet he never attempted to influence my vote or to change in any way my political convictions.

Surprise has occasionally been expressed by strangers that some of Mr. Clay's family were not with him during his long illness at Washington. There was no occasion for any such surprise; he was devoted to his family, and they to him. His affection for them made him unwilling to call any of them from their homes when he did not need them, and therefore in his letters to them, some of which I have seen, he entreated them to remain where they were until he should need their services, when they would be notified; he said also that he was carefully attended to, all his wants were actually anticipated by his attendants, and that he was as comfortable as he could be at his own home. He had his own hired servant, James G. Marshall, whom I met after his death, and who by his intelli-

(Engraved by D. Nichols, from a miniature in possession of John M. Clay, Esq.)

HENRY CLAY, BETWEEN THIRTY AND FORTY.

gence and gentlemanly manner made a most favorable impression on me.

Mr. Clay knew that his son James was then upon his farm near St. Louis, and that the elder brother Thomas, residing near Lexington, could leave home with less inconvenience than any other member of the family, but he preferred that none of them should come until requested by him. Thomas was called for by the dispatch, and he left for Washington immediately upon receiving it.

Thomas returned with the funeral cortège, and some time after probate of the will handed me the document marked "Memoranda of H. Clay." It has no date, but is probably the last document ever signed by Mr. Clay. It was written by Thomas from his father's dictation, and but a few days before his death, as Thomas informed me. I have the original now in my scrap-book. It is as follows:

"MEMORANDA OF H. CLAY.

"I leave with you a check on Messrs. Corcoran & Riggs for any balance standing to my credit in the books of their bank at the time you present the check. The balance now is about \$1600, but it may be diminished before you have occasion to apply for it.

"Mr. Underwood will draw from the secretary of the Senate any balance due to me there for my services, and pay it over to you.

"Out of these funds I wish you to pay Dr. Hall's bill, the apothecary's bill, and Dr. Francis Jackson's bill of Philadelphia.

"Whatever may be necessary to pay those debts, and may be necessary to bear your expenses to Kentucky, had better be appropriated and reserved accordingly, and the balance to be converted in a bank check on New York, which will be safer to carry and more valuable in Kentucky.

"I have settled with James G. Marshall, my servant, and at the end of this month he will have paid me all that I have advanced him, and I shall owe him two dollars. The deed for his lot in Detroit, which he assigned to me as security for being his indorser on a note in bank, is in my little trunk in your mother's

room, in the bundle marked 'Notes and valuable papers.' I wish the deed taken out and delivered to James, as the matter is settled.

"The Messrs. Hunter, who have bought my Illinois land, have been very punctual in paying me the purchase money as it became due heretofore. The last payment of \$2000 is due at Christmas. They have written to me that they will come over and pay it, and at the same time receive a pair of Durham calves as a present which I promised them. I wish that promise fulfilled. The heifer I bought of Mr. Hunt, being a descendant of the imported cow Lucretia, I designed for one of the animals to be presented.

"There is a note of upwards of \$1000 among my papers in the pocket-book, well secured and payable in New Orleans next November. My executors ought to send it down there for collection.

"H. CLAY."

I reproduce this document to illustrate some of Mr. Clay's personal traits, which it does more distinctly and completely than any other paper I have seen. It does not illustrate him as the great orator or statesman, or as the greater leader of men, but illustrates the man just as he had been, and was, in his daily intercourse with the world. In all his dealings he was as exact and as watchful of his personal credit as a banker should be. In his last moments he displayed in this document the particularity and exactness that had characterized him in all his business transactions, and in the same document he displayed his sense of justness by specifying the debts to be paid out of his means then in Washington, and by specifying the rights of the colored servant, James G. Marshall, with such particularity that he would have no difficulty in the assertion of his own rights. And, lastly, who but Henry Clay would, in that extreme hour, have recollected a voluntary promise in regard to the gift of a pair of calves, made probably a year or so before? "I wish," said he, "that promise fulfilled"; and it was fulfilled. I was somewhat curious to see the man whom Mr. Clay recollected at such a time, and in connection with such a promise. I saw him when he came for and took the calves home; he was a plain, uneducated, and obscure man, whose hard hands proved that his life had been a hard one.

As I was the youngest of the three executors, the active duties and general administration of the assets devolved chiefly upon me; though no important step was taken unless approved by the three, and by the sons, especially Thomas and James, who, or whose families, were the residuary devisees. Although the whole of the estate, including the two hundred acres, part of the Ashland tract, devised to his son John M. Clay, and a tract of about one hundred and twenty-five acres known as Mansfield, and devised to the family of his son Thomas H. Clay, was of the value of about \$100,000, yet there was but little

trouble in the administration: first, because the estate was unembarrassed, and secondly, because his sons cheerfully gave me all the assistance in their power, and they were much more familiar with the assets than I was.

The final settlement of our trust as executors was made at the October term of court in 1860, and was satisfactory to the family as well as to ourselves. It was approved by the court, and the executors were released from further responsibility. At this time the estate was not entirely distributed as directed by the will, and could not be until Mrs. Clay's death, which occurred about three or four years afterwards. My reason for making this settlement, and applying for my discharge, was that I was about to remove to New Orleans, and knew that I could no longer perform personally my duties as executor. The other executors were unwilling to act without me; they therefore joined in the settlement and in the application to be discharged, and thereupon the estate passed into other hands.

It may be proper for me to make some reference to the children of Mr. Clay, whom I knew intimately, and towards some of whom I sustained very confidential relations. James B. Clay was appointed by General Taylor, in 1849, *chargé d'affaires* to Portugal, and so far as I know, or believe, discharged the duties of that trust to the satisfaction of the Government. His father, I know, was gratified by the belief that his son had performed those duties to the satisfaction of Mr. Webster, then Secretary of State. In 1857 he was nominated by the Democratic convention for the Ashland district as its candidate for Congress, and was elected, after a heated and bitter contest, over his able Whig competitor, Roger W. Hanson, by a small majority; but for him to have been elected as a Democrat from that district, by even a small majority, was in itself a great triumph. He died in Canada during our civil war, having fled there with his family as to a place of refuge during those troublous times. Had he survived the war, he would doubtless have been crowned with even more exalted honors. Roger Hanson, his competitor, went South, and joining his fortune with the Confederacy rose to eminence, becoming a brigadier-general in the army, and died a few days after the battle of Stone River, from a wound received in that action.

The son T. H. Clay was elected to the Legislature from Fayette County, Ky., during the war, and was afterwards appointed by Mr. Lincoln Minister to Nicaragua; which position he filled to the satisfaction of the Government, so far as I know or have heard. He died at his home several years after his return from that mission.

His son Henry was graduated from West Point, and during the war with Mexico was lieutenant-colonel of a Kentucky regiment, of which W. R. McKee was colonel. Both were mortally wounded at the great battle of Buena Vista while leading their regiment in a charge upon the enemy. And thus three of the sons of Mr. Clay have passed with honors into the history of their country.

The youngest son, John M. Clay, is yet living on part of the old homestead, and is one of the best farmers in the county. He has never held public office, nor indeed sought to hold any, having no ambition in that direction, but is one of our most respectable and respected citizens, and one of my best friends.

Ashland, so memorable as the home of Henry Clay, is now in possession of two of his descendants. His son John M. Clay still owns the two hundred acres devised him by his father's will, and from his front door the monument erected to his father is distinctly visible, though two miles distant. The residue, about three hundred and twenty-five acres, is occupied and owned by Colonel H. C. McDowell, who married the daughter and only surviving child of Colonel Henry Clay. And thus a long-cherished hope of the illustrious father and grandfather has been realized. His beloved Ashland is owned and occupied by some of his own descendants, and I trust that it may pass from one generation of them to the next while the world stands.

Though I have given to some extent some of the traits of Mr. Clay, and though I am now past my eightieth year, yet I feel that I must attempt to make the picture of him somewhat more complete and accurate.

Mr. Clay was tall and broad-shouldered without being bulky or fleshy, and when at all excited was of stately and commanding presence. Though his long limbs were loosely put together, yet his manner was neither awkward, nor uncouth, nor ever embarrassed; on the contrary, it was easy and natural, and wholly unpretentious; it was the easy, nonchalant air of a man accustomed to the ways of the world, and conscious that he was at least the peer of the foremost in every crowd in which he happened to be. Indeed, my own opinion is that he was never in the slightest degree, even in his early youth, awed by the presence of any one; he never seemed to feel, and my belief is he never felt, that he was ever at any time in the presence of any one superior to himself. And therefore he was not only strikingly at ease, but at home, wherever he was, whether among his neighbors or strangers, whether at a social gathering, or at the bar, or as the Speaker of the House of Representatives, or on the floor of the Senate;

and in my judgment he would have felt equally at home at a conference with kings and emperors. He seemed to have not only an instinctive consciousness of his own strength, but of his own special capacity for leadership. Therefore he would take the lead to himself as if unconsciously, whatever the occasion, and as naturally and as gracefully as if it were his birthright; and few there were, if any, who ever seemed to be surprised that he had taken the place for which nature appeared to have designed him. Indeed, without any appearance of self-assertion on his part, and as if unconsciously to himself, there was a something in his presence and his manner that gave to him an authoritative air, and made him for the time the central, the commanding figure of the group about him. Persons who never saw him, and who of course never felt the potency of his presence and manner, can hardly understand the sort of impression made on others by what was called the magnetism of the man. They would probably infer from my general account of him that there must have been in his presence and manner some manifestation of arrogance and vanity; there was, however, in his general intercourse no manifestation of either. I think he was as free from vanity as any one I ever knew. Though often with him, I never knew him to make himself the hero of his own story; and when questioned, as he occasionally was by me and by others in my presence, in regard to any matter in which he had taken a prominent part, he would merely state the facts, the several steps by which results were reached, and then the naked results, just as if there was nothing remarkable in the part he had taken. But whatever the occasion or his mood, and whatever the company or the subject of the conversation, there was a something in his self-poised presence and manner that impressed those around him that within his personality and beneath that manner there was a power, a force of character, to be respected, feared, followed, and honored. Had this quiet force been arrogantly or ostentatiously displayed, it would have broken the charm that made him so attractive and at the same time so commanding. I never saw any approach to any such display, unless possibly in some stormy debate, when with a monarch's voice and in an attitude of lofty defiance he would spurn assaults, whether direct or indirect, upon his principles, his consistency, or his honor.

Probably the idea I have attempted above to describe would be more readily seen by an illustration than by my description of it. Though we were often together, and though we talked of any matter, however unimportant, that casually came up, yet I was never with

him, whether alone or in company, without feeling that I was in the presence of a great man. My supposition was that this feeling on my part was the result of my personal admiration, or possibly of some peculiarity in my own temperament; but on inquiry of others less emotional than myself, I found that in every instance the impression made on them by his presence and manner was identical with that made on me.

Mr. Clay's complexion was very fair; so fair, indeed, that I had supposed that his hair, when a young man, must have been of a sandy or yellowish tint; and on expressing that opinion to Mrs. Clay several years after his death, I was greatly surprised by her prompt reply, "You were never more mistaken; he had when a young man the whitest head of hair I ever saw."

His eyes were gray, and when excited were full of fire; his forehead high and capacious, with a tendency to baldness; his nose prominent, very slightly arched, and finely formed. His mouth was unusually large without being disfiguring. It, however, was so large as to attract immediate notice; so large, indeed, that, as he said, he "never learned how to spit"; he had learned to snuff and smoke tobacco, and but for his unmanageable mouth he would probably have learned to chew also.

His chief physical peculiarity, however, was in the structure of his nervous system; it was so delicately strung that a word, a touch, a memory would set it in motion. But though his nervous system was thus sensitive, yet his emotions, however greatly excited, were of themselves never strong enough to disturb the self-poise of his deliberate judgment. His convictions were fixed as fate, and yet, as I thought, he was the most emotional man I ever knew. I have seen his eyes fill instantly on shaking the hand of an old friend, however obscure, who had stood by him in his early struggles, and whom after a long interval he had suddenly met. I have seen the letter of a grandchild, then residing in a distant State, drop from his hand when he was reading it aloud to some members of his family. His eyes were too full of tears to see, and his speech too full of emotion to utter the touching words of the child. I read the letter: there was not even a suggestion in it to give pain; it was only a loving letter of a child, full of tender messages to her grandmother and to him.

His sympathies were wide as human nature, and were alive not only to its struggles and its virtues, but even to its infirmities; and, in case of any great affliction in the family of a friend or neighbor, his condolence was ever ready, and in a manner and tone of voice as

tender and touching and as natural as if the affliction were his own.

This emotional quality so natural to him, and always so naturally shown, was a marked characteristic and a great element of his power over the heart. His magnetic power was a natural result of the lofty, the unmistakable and generously tempered manliness of the man.

The muscles of his face, even in his old age, never had any of the rigidity or leathery appearance or toughness which sometimes accompanies old age; on the contrary, his features even then were apparently as tender and as flexible as a child's, and expressed as naturally and as readily as the features of a child the emotion of the moment, whatever that emotion was; and when in high debate his every muscle, his whole physical structure, would be alive with the lofty passion that was giving fire and force to every thought he uttered. I have never seen any one but himself whose entire physical structure so readily and so naturally responded to its own emotions and passions; nor ever heard any voice but his own that so harmonized with whatever he felt and uttered. Indeed, when there would seem to be no occasion for any great emotion or for the display of it, yet if the subject presented issues of great concern to his client, to the public, or to himself, his heart, full of the subject, and as if impressed with its responsibility, would manifest its emotion not only in the preliminary outlines of the facts to be considered, but frequently even before he had uttered a word. You would see the emotion in his whole person as he slowly rose to his feet; you would see it in his drooping posture, in the deathly pallor of his face, in his brimful eye, in the spasmodic twitching of his under lip; and upon the utterance of the first sentence you would hear it in the touching tones of his magnetic voice. These all harmonized naturally and without effort with the passions and utterances of the moment. It was nature visibly at work, and bringing into harmonious action before your eyes all the great elements, mental, moral, and physical; and this rare combination of forces actively at work, in high debate, gave to his eloquence a naturalness, a concentrated earnestness and impetuosity that for the time was overwhelming. It awed men even when they were not convinced by him.

Mr. Clay's father, a Baptist preacher in humble circumstances, and with a large family, was himself somewhat distinguished in his day for eloquence. I have seen a letter written more than sixty years ago by a gentleman in Virginia who knew Mr. Clay's father, in which he states that crowds would come to hear him

when it was known that he would preach. This letter was written to Mr. Clay and found among his papers. He died in 1781, when the son Henry was between four and five years old, and thereupon the widow took charge of the small estate and seven fatherless children. It was a heavy burden, but Providence had thrown it on her, and she proved equal to it; at least so thought her illustrious son. He always paid to her the most loving attention until her death in 1827, and never mentioned her but with reverence, gratitude, and love. A tasteful but modest monument placed by him over her grave now stands near the conspicuous shaft afterwards erected by the public to his own memory.

The widow did what she could for all her children, though she could do but little towards their school education. She sent Henry to a common country school in the Slashes of Hanover, where he learned to read, write, and cipher. Thereupon his school education ended forever. When not at school he aided in the family maintenance by such labor as a boy could do on the small farm. This was the daily routine, until in 1792 his stepfather, Captain Watkins, who seems to have felt a special interest in this stepson, made an arrangement with the clerk of the High Court of Chancery of Richmond, Virginia, by which this country boy, this uneducated orphan, secured not only employment as deputy clerk, but maintenance while so employed.

Present occupation and present maintenance were matters of first necessity to him, and these being for the time secure, his mother and stepfather removed to Kentucky, and left the impulsive, penniless boy at the age of fifteen, amid the temptations of city life, to his own guidance; and yet this uneducated orphan, without money or any especial friends to superintend his associations or his habits, apparently alone in the world, became in after years and at an early period of his long life the observed of all observers, not only as the most commanding speaker the National House of Representatives ever had, but as the most commanding orator and the lordliest leader of his day. There was not a crisis during his public career to which he was unequal, nor a storm threatening to wreck the Union in which he was not the pilot who weathered that storm. His faith in his own strength and in his own capacity to hold the helm and guide the ship was unflinching, and he had the happy gift of inspiring his friends with a like confidence in his capacity and strength. "Who sails with me comes safe to land" was alike his faith and their faith, and had he been alive in 1860 and 1861, every

heart and every eye would have turned to him to take the helm again.

How do I account for a career so remarkable, when its beginning was under circumstances apparently so unpropitious? In the first place, nature had endowed him with great possibilities, which, naturally developed and matured, were bound to fit him for a great career. In other words, greatness in his case was inevitable, unless his elementary forces, mental, moral, and physical, were dwarfed or perverted by some unnatural or unpropitious training in his childhood and youth. Second, that fortunately for him his innate faculties, his possibilities, were neither in his childhood nor in his boyhood nor in his early manhood subjected to any narrow or unnatural training; on the contrary, all his surroundings in his infancy and until he could walk alone, a man among men, were by the chances of life or by the hand of Providence the very surroundings of all others, then within his reach, the most likely to develop naturally and to their full completeness, the peculiar faculties with which nature had endowed him.

Fortunately Mr. Clay's real education, that sort of education which aroused and stimulated into activity his elementary faculties, neither began nor ended at the country school in the Slashes of Hanover. What he learned at that country school was, to be sure, of service to him, but of service only as a humble instrument in the hands of the boy. Had he, however, learned nothing else, had his whole education been limited to the little he learned at that school, his great possibilities would never have been developed, and he no doubt would have lived and died in obscurity, unhonored and unsung. Nature, however, did not lose sight of the orphan son of the Baptist preacher, though tossed as he had been into the big world at the age of fifteen, apparently alone and dependent upon his daily labor for his daily bread. The world is a hard school and full of hazard to an impulsive boy, even when guided by the watchful eye of the parent. But however hard and hazardous the world may be to an impulsive boy, thrown into it at the age of fifteen, and on his own resources, yet in his case, and by a fortunate succession of circumstances unexpected and apparently of but little importance at the time, the arrangement under which he was left at that age and to his own guidance, amid the temptations of the city of Richmond, was not only the most fortunate event of his life, but probably the very best arrangement for the natural development of all powers.

I, however, am not writing the biography of Mr. Clay. Those who expect to see in this sketch the particulars of his life will be disap-

pointed. My sole purpose in undertaking this labor in the eighty-first year of my age was to preserve in a family scrap-book, for my descendants, the letters written by him to me, as well as other original papers of some interest bearing his signature; and while engaged in that work it occurred to me that it would add to the interest of the autographs were I to give my personal recollections of him, and the impression he had made on me. I regret that the same idea did not occur to me at an earlier day, before time and toil and the troubles incident to a long life had worn me out. I ought to have begun the work, if at all, twenty years ago, when my mind was more active and my memory fresher. But as I did not undertake it for the public, but wholly for the entertainment of my descendants, I do not regret, and am sure they will not regret, that I, even in my old age, undertook on their account to do what I have done, however meager my reminiscences may seem, or however inartistic the style and the manner in which those reminiscences have been presented. Having completed a task I set for myself, and as well as under the circumstances I could, I now bring it to a close by annexing a few facts and anecdotes which tend to throw some light on the character of Mr. Clay.

In a conversation in regard to General Washington, an inquiry was made of Mr. Clay as to his information in regard to certain vices imputed to the General by tradition. "Ah," said Mr. Clay, "General Washington was so good and great a man that no tradition to his disparagement should be remembered or repeated."

About the time of General Taylor's nomination by the Whig convention as its candidate for the presidency, there was believed to be an estrangement between Mr. Clay and Mr. Crittenden. It was the more noticed because the two had been known as life-long friends, both personal and political. Yet I never heard Mr. Clay speak of it, though I have heard the matter discussed in his presence while he was reading a newspaper. During this estrangement I read a letter from Mr. Clay to his wife, containing a message to me, saying that President Fillmore had consulted him in regard to the appointment of Attorney-General, and that he had advised him to appoint Mr. Crittenden to that office. In the same letter he expressed the wish that his family should be kind to Mr. Crittenden. As to any real reconciliation between the two, I have no knowledge, but I have strong doubts.

During the administration of General Jackson, the public was startled by the rumor of a defalcation in the Post-Office Department,

the Hon. W. T. Barry of Lexington city being the Postmaster-General. Mr. Clay, then in the Senate, was leader of the opposition to General Jackson and to his administration. The party struggle was fierce and bitter, and, besides, Mr. Barry was a decided partisan of General Jackson, in whose cabinet he was, and had led the opposition in Kentucky to Mr. Clay and Mr. Adams. Under the circumstances Mr. Barry had no right to expect liberal treatment at the hands of Mr. Clay. Yet when the matter was in some way before the Senate, Mr. Clay took occasion to say in substance that the rumored defalcation might be true, but even if true he was sure that Mr. Barry had no personal connection with it; that he had known Mr. Barry many years, and vouched for the integrity of the man. Mr. Barry on the next day paid his personal respects to Mr. Clay, and from that time on their former pleasant intercourse was resumed.

During the many years of my intimacy with Mr. Clay, there was only one occasion on which I ever heard him speak harshly of any public man of his time, and that was in allusion to Mr. Seward. Though open as day on every public question, and though in fierce debate never afraid to throw a thunderbolt whenever in his opinion the occasion called for it, yet in his usual intercourse he was exceedingly reserved in his criticism of other public men.

Mr. Clay was very fond of pleasantries and occasionally indulged in a sort of persiflage, and when in the humor could say things without giving offense which, but for his peculiar manner and tone of voice and the pleasant twinkle of his eye, would have been somewhat offensive to a "touchy" person.

The following instance illustrates what I mean. It is well known that there were occasionally very unpleasant encounters in the Senate between Colonel Benton and Mr. Clay. To say the least, there was no love between the two. Colonel Benton, however, and Mrs. Clay were cousins, and the Colonel, notwithstanding the unpleasant passes between Mr. Clay and himself, was in the habit of calling at Ashland to pay his personal respects to her; and she on such occasions was always glad to see him, for she was somewhat proud of her Hart blood, of which family Colonel Benton was a member, his mother being a Hart. On one of these occasions my wife called at Ashland and found Colonel Benton and Mr. Clay in the parlor together. In a few moments Mrs. Clay made her appearance, and as she entered Mr. Clay, in a tone of charming banter and with a sort of mischievous humor in his eye, rose, and pointing to her said, "There, Colonel, is a member of my

family who never abused you." The effect was irresistible. All caught the idea and joined in a hearty laugh, and no one seemed to enjoy the very suggestive allusion more than the Colonel himself.

The following incident, however, was tinged with no such attempt at humor. It is well known that Mr. Tyler signalized his administration by betraying the confidence of the Whig party, by which he had been elected Vice-President. Suspicions and rumors were soon afloat that Mr. Tyler would not be true to the platform on which he was elected, and before these suspicions were absolutely confirmed by his own subsequent action, Mr. Clay, the leader of the Whig party, made a morning call on the President at the White House, and on entering the room said to Mr. Tyler, "Am I to understand that the two gentlemen I met as I came up the steps to your room are the advisers of the President?" The two gentlemen referred to were Mr. Cushing of Massachusetts and Governor Wise of Virginia. Both these gentlemen were Democratic politicians, and leaders of what was known then as the "Corporal's Guard." They had been closeted with Mr. Tyler just before Mr. Clay came, and he evidently understood the purport of their visit. Mr. Clay's remark was made in a very stately though civil manner. Mr. Tyler's face flushed up very quickly, but what his reply was I do not now remember. This incident was told me by a gentleman who was present, and I am satisfied of its correctness.

On the morning of the day when President

Harrison was expected to send to the Senate the names of the members of his Cabinet, some one remarked, in the presence of Mr. Clay, Mr. Crittenden, and several other members of Congress, that Mr. Webster was to be Secretary of the Treasury. "Oh, no," said Mr. Clay, "Mr. Webster is to take the Department of State." "That," said the first speaker, "was the original programme, but as Mr. Webster prefers the Treasury Department the President has consented to appoint him to the Treasury." Instantly and in his most impassioned manner Mr. Clay replied, "I will oppose it; I will denounce it in open Senate. The State Department is the proper place for Mr. Webster." This incident was communicated to me by the Hon. Richard Hawes, who at the time it occurred, in 1841, was a member of Congress from the Ashland district, and was present at the conversation. It is enough to say that Mr. Webster was nominated and confirmed Secretary of State, and Mr. Clay was satisfied.

It may not be amiss to say in conclusion that though he was not a scholar, though he had no knowledge of the metaphysics or rhetoric or logic of the schools, and in fact had a hearty contempt for all three of them, yet Mr. Clay's knowledge was always equal to the demands of his great career. In what debate did he ever fail to reach "the height of the great argument" the occasion called for? Or in what debate did any competitor because of his ripe scholarship pluck the laurel from his brow?

J. O. Harrison.

IDYLLS.

CREUSA, in those idyll lands delaying,
 Forever hung with mellow mists of gold,
 We find but phantoms of delights long cold.
 We listen to the pine and ilex swaying
 Only in echo; to the players playing,
 On faint, sweet flutes, lost melodies of old.
 The beauteous heroes are but stories told;
 Vain at the antique altars all our praying.
 Oh, might we join, in vales unknown to story,
 On shores unsung, by Western seas sublime,
 The spirit of that loveliness and glory
 Hellenic, with these hearts of fuller time,
 Then to our days would sunnier joys belong
 Than thrill us now in old idyllic song.

Henry Tyrrell.

THE MINISTER'S CHARGE;

OR, THE APPRENTICESHIP OF LEMUEL BARKER.*

BY W. D. HOWELLS,

Author of "Venetian Life," "A Modern Instance," "The Rise of Silas Lapham," etc.

XXXII.

EWELL returned to town for the last time in the third week of September, bringing his family with him.

This was before the greater part of his oddly assorted congregation had thought of leaving the country, either the rich cottagers whose family tradition or liberal opinions kept them in his church, or the boarding and camping elements who were uniting a love of cheapness with a love of nature in their prolonged sojourn among the woods and fields. Certain families, perhaps half of his parish in all, were returning because the schools were opening, and they must put their children into them; and it was both to minister to the spiritual needs of these and to get his own children back to their studies that the minister was at home so early.

It was, as I have hinted already, a difficult and laborious season with him; he himself was always a little rusty in his vocation after his summer's outing and felt weakened rather than strengthened by his rest. The domestic machine started reluctantly; there was a new cook to be got in, and Mrs. Sewell had to fight a battle with herself, in which she invited him to share, before she could settle down for the winter to the cares of housekeeping. The wide skies, the dim mountain slopes, the long, delicious drives, the fresh mornings, the sweet, silvery afternoons of their idle country life, haunted their nerves and enfeebled their wills.

One evening in the first days of this moral disability, while Sewell sat at his desk trying to get himself together for a sermon, Barker's name was brought up to him.

"Really," said his wife, who had transmitted it from the maid, "I think it's time you protected yourself, David. You can't let this go on forever. He has been in Boston nearly two years now; he has regular employment, where, if there's anything in him at all, he ought to prosper and improve without coming to you every other night. What *can* he want now?"

"I'm sure I don't know," said the minister, leaning back in his chair, and passing his hand wearily over his forehead.

"Then send down and excuse yourself. Tell him you're busy, and ask him to come another time!"

"Ah, you know I can't do that, my dear."

"Very well, then; I will go down and see him. You sha'n't be interrupted."

"Would you, my dear? That would be very kind of you! Do get me off some way; tell him I'm coming to see him very soon." He went stupidly back to his writing without looking to see whether his wife had meant all she said; and after a moment's hesitation she descended in fulfillment of her promise; or, perhaps rather it was a threat.

She met Lemuel not unkindly, for she was a kind-hearted woman; but she placed duty before charity even, and she could not help making him feel that she was there in the discharge of a duty. She explained that Mr. Sewell was very unusually busy that evening, and had sent her in his place, and hoped soon to see him. She bade Lemuel sit down, and he obeyed, answering all the questions as to the summer and his occupations and health, and his mother's health, which she put to him in proof of her interest in him; in further evidence of it, she gave him an account of the Sewell family's doings since they last met. He did not stay long, and she returned slowly and pensively to her husband.

"Well?" he asked, without looking round.

"Well, it's all right," she answered, with rather a deep breath. "He didn't seem to have come for anything in particular; I told him that if he wished specially to speak with you, you would come down."

Sewell went on with his writing, and after a moment his wife said, "But you must go and see him very soon, David; you must go to-morrow."

"Why?"

"He looks wretchedly, though he says he's very well. It made my heart ache. He looks perfectly wan and haggard. I wish," she burst out, "I wish I had let you go down and see him!"

"Why—why, what was the matter?" asked

Sewell, turning about now. "Did you think he had something on his mind?"

"No, but he looked fairly sick. Oh, I wish he had never come into our lives!"

"I'm afraid he hasn't got much good from us," sighed the minister. "But I'll go round and look him up in the morning. His trouble will keep overnight, if it's a real trouble. There's that comfort, at least. And now, do go away, my dear, and leave me to my writing."

Mrs. Sewell looked at him, but turned and left him, apparently reserving whatever sermon she might have in her mind till he should have finished his.

The next morning he went to inquire for Lemuel at Mr. Corey's. The man was sending him away from the door with the fact merely that Lemuel was not then in the house, when the voice of Mr. Corey descending the stairs called from within: "Is that you, Sewell? Don't go away! Come in!"

The old gentleman took him into the library, and confessed in a bit of new slang, which he said was delightful, that he was all balled up by Lemuel's leaving him, and asked Sewell what he supposed it meant.

"Left you? Meant?" echoed Sewell.

When they got at each other it was understood that Lemuel, the day before, had given up his employment with Mr. Corey, expressing a fit sense of all his kindness and a fit regret at leaving him, but alleging no reasons for his course; and that this was the first that Sewell knew of the affair.

"It must have been that which he came to see me about last night," he said with a sort of anticipative remorse. "Mrs. Sewell saw him—I was busy."

"Well! Get him to come back, Sewell," said Mr. Corey, with his whimsical imperiousness; "I can't get on without him. All my moral and intellectual being has stopped like a watch."

Sewell went to the boarding-house where Lemuel took his meals, but found that he no longer came there and had left no other address. He knew nowhere else to ask, and he went home to a day of latent trouble of mind, which whenever it came to the light defined itself as helpless question and self-reproach in regard to Barker.

That evening as he sat at tea, the maid came with the announcement that there was a person in the reception-room who would not send in any name, but wished to see Mr. Sewell, and would wait.

Sewell threw down his napkin, and said, "I'll bring him in to tea."

Mrs. Sewell did not resist; she bade the girl lay another plate.

Sewell was so sure of finding Lemuel in

the reception-room, that he recoiled in dismay from the girlish figure that turned timidly from the window to meet him with a face thickly veiled. He was vexed too; here, he knew from the mystery put on, was one of those cases of feminine trouble, real or unreal, which he most disliked to meddle with.

"Will you sit down?" he said as kindly as he could, and the girl obeyed.

"I thought they would let me wait. I didn't mean to interrupt you," she began, in a voice singularly gentle and unaffected.

"Oh, no matter!" cried Sewell. "I'm very glad to see you."

"I thought you could help me. I'm in great trouble—doubt——"

The voice was almost childlike in its appealing innocence.

Sewell sat down opposite the girl and bent sympathetically forward. "Well?"

She waited a moment. Then, "I don't know how to begin," she said hoarsely, and stopped again.

Sewell was touched. He forgot Lemuel; he forgot everything but the heartache which he divined before him, and his Christ-derived office, his holy privilege, of helping any in want of comfort or guidance. "Perhaps," he said, in his loveliest way,—the way that had won his wife's heart, and that still provoked her severest criticism for its insincerity, it was so purely impersonal,—“perhaps that isn't necessary, if you mean beginning at the beginning. If you've any trouble that you think I can advise you in, perhaps it's better for both of us that I shouldn't know very much of it."

"Yes?" murmured the girl, questioningly.

"I mean that if you tell me much, you will go away feeling that you have somehow parted with yourself, that you're no longer in your own keeping, but in mine; and you know that in everything our help must really come from within our own free consciences."

"Yes," said the girl again, from behind the veil which completely hid her face. She now hesitated a long time. She put her handkerchief under her veil; and at last she said, "I know what you mean." Her voice quivered pathetically; she tried to control it. "Perhaps," she whispered huskily, after another interval, "I can put it in the form of a question."

"That would be best," said Sewell.

She hesitated; the tears fell down upon her hands behind her veil; she no longer wiped them. "It's because I've often—heard you; because I know you will tell me what's true and right——"

"Your own heart must do that," said the minister, "but I will gladly help you all I can."

She did not heed him now, but continued as if rapt quite away from him.

"If there was some one—something—if there was something that it would be right for you to do—to have, if there was no one else; but if there were some one else that had a right first——" She broke off and asked abruptly, "Don't you think it is always right to prefer another—the interest of another to your own?"

Sewell could not help smiling. "There is only one thing for us to do when we are in any doubt or perplexity," he said cheerily, "and that is the unselfish thing."

"Yes," she gasped; she seemed to be speaking to herself. "I saw it, I knew it! Even if it kills us, we must do it! Nothing ought to weigh against it! Oh, I thank you!"

Sewell was puzzled. He felt dimly that she was thanking him for anguish and despair. "I'm afraid that I don't quite understand you."

"I thought I told you," she answered, with a certain reproach and a fall of courage in view of the fresh effort she must make. It was some moments before she could say "If you knew that some one—some one who was—everything to you—and that you knew—believed——"

At fifty it is hard to be serious about these things, and it was well for the girl that she was no longer conscious of Sewell's mood.

"—Cared for you; and if you knew that before he had cared for you, there had been some else—some else that he was as much to as he was to you, and that couldn't give him up, what—should you——"

Sewell fetched a long sigh of relief; he had been afraid of a much darker problem than this. He almost smiled.

"My dear child,"—she seemed but a child there before the mature man with her poor little love-trouble, so intricate and hopeless to her, so simple and easy to him,— "that depends upon a great many circumstances."

He could feel through her veil the surprise with which she turned to him: "You said, whenever we are in doubt, we must act unselfishly."

"Yes, I said that. But you must first be sure what is really selfish——"

"I *know* what is selfish in this case," said the girl with a sublimity which, if foolish, was still sublimity. "She is sick—it will kill her to lose him— You have said what I expected, and I thank you, thank you, *thank* you! And I will do it! Oh, don't fear now but I shall; I *have* done it! No matter," she went on in her exaltation, "no matter how much we care for each other, now!"

"No," said Sewell, decidedly. "That doesn't follow. I have thought of such things; there was such a case within my experience

once,"— he could not help alleging this case, in which he had long triumphed,— "and I have always felt that I did right in advising against a romantic notion of self-sacrifice in such matters. You may commit a greater wrong in that than in an act of apparent self-interest. You have not put the case fully before me, and it isn't necessary that you should, but if you contemplate any rash sacrifice, I warn you against it."

"You said that we ought to act unselfishly."

"Yes, but you must beware of the refined selfishness which shrinks from righteous self-assertion because it is painful. You must make sure of your real motive; you must consider whether your sacrifice is not going to do more harm than good. But why do you come to me with your trouble? Why don't you go to your father—your mother?"

"I have none."

"Ah——"

She had risen and pushed by him to the outer door, though he tried to keep her. "Don't be rash," he urged. "I advise you to take time to think of this——"

She did not answer; she seemed now only to wish to escape, as if in terror of him.

She pulled open the door, and was gone.

Sewell went back to his tea, bewildered, confounded.

"What's the matter? Why didn't he come in to tea with you?" asked his wife.

"Who?"

"Barker."

"What Barker?"

"David, what *is* the matter?"

Sewell started from his daze, and glanced at his children: "I'll tell you by and by, Lucy."

XXXIII.

A MONTH passed, and Sewell heard nothing of Lemuel. His charge, always elusive and evanescent, had now completely vanished, and he could find no trace of him. Mr. Corey suggested advertising. Bellingham said, why not put it in the hands of a detective? He said he had never helped work anything up with a detective; he rather thought he should like to do it. Sewell thought of writing to Barker's mother at Willoughby Pastures, but he postponed it; perhaps it would alarm her if Barker were not there. Sewell had many other cares and duties; Lemuel became more and more a good intention of the indefinite future. After all, he had always shown the ability to take care of himself, and except that he had mysteriously disappeared there was no reason for anxiety about him.

One night his name came up at a moment when Sewell was least prepared by interest or

expectation to see him. He smiled to himself, in running downstairs, at the reflection that he never seemed quite ready for Barker. But it was a relief to have him turn up again; there was no question of that, and Sewell showed him a face of welcome that dropped at sight of him. He scarcely knew the gaunt, careworn face or the shabby figure before him, in place of the handsome, well-dressed young fellow whom he had come to greet. There seemed a sort of reversion in Barker's whole presence to the time when Sewell first found him in that room; and in whatever trouble he now was, the effect was that of his original rustic constraint.

Trouble there was of some kind, Sewell could see at a glance, and his kind heart prompted him to take Lemuel's hand between both of his. "Why, my dear boy!" he began; but he stopped and made Lemuel sit down, and waited for him to speak, without further question or comment.

"Mr. Sewell," the young man said abruptly, "you told me once you—that you sometimes had money put into your hands that you could lend."

"Yes," replied Sewell, with eager cordiality.

"Could I borrow about seventy-five dollars of you?"

"Why, certainly, Barker!" Sewell had not so much of what he called his flying-charity fund by him, but he instantly resolved to advance the difference out of his own pocket.

"It's to get me an outfit for horse-car conductor," said Lemuel. "I can have the place if I can get the outfit."

"Horse-car conductor!" reverberated Sewell. "What in the world for?"

"It's work I can do," answered Lemuel, briefly, but not resentfully.

"But there are so many other things—better—fitter—more profitable! Why did you leave Mr. Corey? I assure you that you have been a great loss to him—in every way. You don't know how much he valued you, personally. He will be only too glad to have you come back."

"I can't go back," said Lemuel. "I'm going to get married."

"Married!" cried Sewell in consternation.

"My—the lady that I'm going to marry—has been sick ever since the first of October, and I haven't had a chance to look up any kind of work. But she's better now, and I've heard of this place I can get. I don't like to trouble you; but—everything's gone—I've got my mother down here helping take care of her; and I must do something. I don't know just when I can pay you back, but I'll do it sometime."

"Oh, I'm sure of that," said Sewell, from the abyss of hopeless conjecture into which

these facts had plunged him; his wandering fancy was dominated by the presence of Lemuel's mother with her bloomers in Boston. "I—I hope there's nothing serious the trouble with your—the lady?" he said, rubbing away with his hand the smile that came to his lips in spite of him.

"It's lung trouble," said Lemuel, quietly.

"Oh!" responded Sewell. "Well! Well!" He shook himself together, and wondered what had become of the impulse he had felt to scold Barker for the idea of getting married. But such a course now seemed not only far beyond his province,—he heard himself saying that to Mrs. Sewell in self-defense when she should censure him for not doing it,—but utterly useless in view of the further complications. "Well! This is great news you tell me—a great surprise. You're—you're going to take an important step——You—you——Of course, of course! You must have a great many demands upon you, under the circumstances. Yes, yes! And I'm very glad you came to me. If your mind is quite made up about——"

"Yes, I've thought it over," said Lemuel.

"The lady has had to work all her life, and she—she isn't used to what I thought—what I intended—any other kind of people; and it's better for us both that I should get some kind of work that won't take me away from her too much——" He dropped his head, and Sewell with a flash of intelligence felt a thrill of compassionate admiration for the poor, foolish, generous creature, for so Lemuel complexly appeared to him.

Again he forbore question or comment.

"Well—well! we must look you up, Mrs. Sewell and I. We must come to see you—the lady." He found himself falling helplessly into Lemuel's way of describing her. "Just write me your address here,"—he put a scrap of paper before Lemuel on the davenport,— "and I'll go and get you the money."

He brought it back in an envelope which held a very little more than Lemuel had asked for—Sewell had not dared to add much—and Lemuel put it in his pocket.

He tried to say something; he could only make a husky noise in his throat.

"Good-night!" said Sewell, pressing his hand with both of his again, at the door. "We shall come very soon."

"MARRIED!" said Mrs. Sewell, when he returned to her; and then she suffered a silence to ensue, in which it seemed to Sewell that his inculcation was visibly accumulating mountains vast and high. "*What did you say?*"

"Nothing," he answered, almost gayly; the case was so far beyond despair. "What should *you* have said?"

XXXIV.

LEMUEL got a conductor's overcoat and cap at half-price from a man who had been discharged, and put by the money saved to return to Sewell when he should come. He entered upon his duties the next morning, under the instruction of an old conductor, who said "Hain't I seen you som'eres before?" and he worked all day, taking money and tickets, registering fares, helping ladies on and off the car, and monotonously journeying back and forth over his route. He went on duty at six o'clock in the morning, after an early breakfast that 'Manda Grier and his mother got him, for Statira was not strong enough yet to do much, and he was to be relieved at eight. At nightfall, after two half-hour respites for dinner and tea, he was so tired that he could scarcely stand.

"Well, how do you like it, as fur's you've gone?" asked the instructing conductor, in whom Lemuel had recognized an old acquaintance. "Sweetlife, ain't it? There! That switch hain't worked again! Jump off, young man, and put your shoulder to the wheel!"

The car had failed to take the right-hand turn where the line divided; it had to be pushed back, and while the driver tugged and swore under his breath at his horses, Lemuel set himself to push the car.

"'S no use!" said the driver finally. "I got to hitch 'em on at the other end, and pull her back."

He uncoupled the team from the front of the car, and swung round with it. Lemuel felt something strike him on the leg, and he fell down. He scrambled to his feet again, but his left leg doubled under him; it went through his mind that one of the horses must have lashed out and broken it; then everything seemed to stop.

The world began again for him in the apothecary's shop where he had been carried, and from which he was put into an ambulance, by a policeman. It stopped again, as he whirled away; it renewed itself in anguish, and ceased in bliss as he fainted from the pain or came to.

They lifted him up some steps, at last, and carried him into a high, bright room, where there were two or three cots, and a long glass case full of surgical instruments. They laid him on a cot, and some one swiftly and skillfully undressed him. A surgeon had come in, and now he examined Lemuel's leg. He looked once or twice at his face.

"This is a pretty bad job. I can't tell how bad till you've had the ether. Will you leave it to me?"

"Yes. But do the best you can for me."

"You may be sure I will."

Lemuel believed that they meant to cut off his leg. He knew that he had a right to refuse and to take the consequences, but he would not; he had no right to choose death, when he had others to live for.

He woke deathly sick at first, and found himself lying in bed, one of the two rows in a long room, where there were some quiet women in neat caps and seersucker dresses going about, with bowls of food and bottles of medicine.

Lemuel still felt his leg, and the pain in it, but he had heard how mutilated men felt their lost limbs all their lives, and he was afraid to make sure by the touch of his hand.

A nurse who saw his eyes open came to him. He turned them upon her, but he could not speak. She must have understood. "The doctor thinks he can save your leg for you; but it's a bad fracture. You must be careful to keep very still."

He fell asleep; and life began again for him, in the midst of suffering and death. He saw every day broken and mangled men, drunk with ether, brought up as he had been, and laid in beds; he saw the priest of the religion to which most of the poor and lowly still belong, go and come among the cots, and stand by the pillows where the sick feebly followed him in the mystical gestures which he made on his brow and breast; he learned to know the use of the white linen screen which was drawn about a bed to hide the passing of a soul; he became familiar with the helpless sympathy, the despair of the friends who came to visit the sick and dying.

He had not lacked for more attention and interest from his own than the rules of the hospital allowed. His mother and 'Manda Grier came first, and then Statira when they would let her. She thought it hard that she was not suffered to do the least thing for him; she wished to take him away to their own rooms, where she could nurse him twice as well. At first she cried whenever she saw him, and lamented over him, so that the head nurse was obliged to explain to her that she disturbed the patients, and could not come any more unless she controlled herself. She promised, and kept her word; she sat quietly by his pillow and held his hand, when she came, except when she put up her own to hide the cough which she could not always restrain. The nurse told her that of course she was not accountable for the cough, but she had better try to check it. Statira brought troches with her, and held them in her mouth for this purpose.

Lemuel's family was taken care of in this time of disaster. The newspapers had made

his accident promptly known, and not only Sewell, but Miss Vane and Mrs. Corey had come to see if they could be of any use.

One day a young girl brought a bouquet of flowers and set it by Lemuel's bed, when he seemed asleep. He suddenly opened his eyes, and saw Sybil Vane for the first time since their quarrel.

She put her finger to her lip, and smiled with the air of a lady benefactress; then, with a few words of official sympathy, she encouraged him to get well, and flitted to the next bed, where she bestowed a jacquemint rosebud on a Chinaman dying of cancer.

Sewell came often to see him, at first in the teeth of his mother's obvious hostility, but with her greater and greater relenting. Nothing seemed gloomier than the outlook for Lemuel, but Sewell had lived too long not to know that the gloom of an outlook has nothing to do with a man's real future. It was impossible, of course, for Lemuel to go back to Mr. Corey's now with a sick wife, who would need so much of his care. Besides, he did not think it desirable on other accounts. He recurred to what Lemuel had said about getting work that should not take him too far away from the kind of people his betrothed was used to, and he felt a pity and respect for the boy whom life had already taught this wisdom, this resignation. He could see that before his last calamity had come upon him, Barker was trying to adjust his ambition to his next duty, or rather to subordinate it; and the conviction that he was right gave Sewell courage to think that he would yet somehow succeed. It also gave him courage to resist, on Barker's behalf, the generous importunities of some who would have befriended him. Mr. Corey and Charles Bellingham drove up to the hospital one day to see Lemuel; and when Sewell met them the same evening, they were full of enthusiasm. Corey said that the effect of the hospital, with its wards branching from the classic building in the center, was delightfully Italian; it was like St. Peter's on a small scale, and he had no idea how interesting the South End was; it was quite a bit of foreign travel to go up there. Bellingham had explored the hospital throughout; he said he had found it the thing to do—it was a thing for everybody to do; he was astonished that he had never done it before. They united in praising Barker, and they asked what could be done for him. Corey was strenuous for his coming back to him; at any rate, they must find something for him. Bellingham favored the notion of doing something for his education; a fellow like that could come to almost anything.

Sewell shook his head. "All that's impossible now. With that girl ——"

"Oh, confound her!" cried Bellingham.

"I was rather disappointed at not seeing his mother," said Corey. "I had counted a good deal, I find, upon Mrs. Barker's bloomers."

"With a girl like that for his wife," pursued Sewell, "the conditions are all changed. He must cleave to her in mind as well as body, and he must seek the kind of life that will unite them more and more, not less and less. In fact, he was instinctively doing so when this accident happened. That's what marriage means."

"Oh, not always," suggested Corey.

"He must go back to Willoughby Pastures," Sewell concluded, "to his farm."

"Oh, come now!" said Bellingham, with disgust.

"If that sort of thing is to go on," said Corey, "what is to become of the ancestry of the future *élite* of Boston? I counted upon Barker to found one of our first families. Besides, any Irishman could take his farm and do better with it. The farm would be meat to the Irishman, and poison to Barker, now that he's once tasted town."

"Yes, I know all that," said Sewell, sadly. "I once thought the greatest possible good I could do Barker, after getting him to Boston, was to get him back to Willoughby Pastures; but if that was ever true, the time is past. Now, it merely seems the only thing possible. When he gets well, he will still have an invalid wife on his hands; he must provide her a home; she could have helped him once, and would have done so, I've no doubt; but now she must be taken care of."

"Look here!" said Bellingham. "What's the reason these things can't be managed as they are in the novels? In any well-regulated romance that cough of hers would run into quick consumption and carry Barker's fiancée off in six weeks; and then he could resume his career of usefulness and prosperity here, don't you know. He could marry some one else and found that family that Corey wants."

They all laughed, Sewell ruefully.

"As it is," said Corey, "I suppose she'll go on having hemorrhages to a good old age, and outlive him, after being a clog and burden to him all his life. Poor devil! What in the world possesses him to want to marry her? But I suppose the usual thing."

This gave Sewell greater discomfort than the question of Lemuel's material future. He said listlessly, "Oh, I suppose so," but he was far from thinking precisely that. He had seen Lemuel and the young girl together a great deal, and a painful misgiving had grown up in his mind. It seemed to him that while he had seen no want of patience and kindness towards her in Lemuel, he had not seen the

return of her fondness, which, silly as it was in some of its manifestations, he thought he should be glad of in him. Yet he was not sure. Barker was always so self-contained that he might very well feel more love for her than he showed; and, after all, Sewell rather weakly asked himself, was the love so absolutely necessary?

When he repeated this question in his wife's presence, she told him she was astonished at him.

"You know that it is *vital*ly necessary! It's all the more necessary, if he's so superior to her, as you say. I can't think what's become of your principles, my dear!"

"I do: you've got them," said Sewell.

"I really believe I have," said his wife, with that full conviction of righteousness which her sex alone can feel. "I have always heard you say that marriage without love was not only sinful in itself, but the beginning of sorrow. Why do you think now that it makes no difference?"

"I suppose I was trying to adapt myself to circumstances," answered Sewell, frankly at least. "Let's hope that my facts are as wrong as my conclusions. I'm not sure of either. I suppose if I saw him idolizing so slight and light a person as she seems to be, I should be more disheartened about his future than I am now. If he overvalued her, it would only drag him lower down."

"Oh, his future! Drag him down! Why don't you think of *her*, going up there to that dismal wilderness, to spend her days in toil and poverty, with a half-crazy mother-in-law, and a rheumatic brother-in-law, in such a looking hovel?" Mrs. Sewell did not group these disadvantages conventionally, but they were effective. "You have allowed your feelings about that baffling creature to blind you to everything else, David. Why should you care so much for his future, and nothing for hers? Is that so very bright?"

"I don't think that either is dazzling," sighed the minister. Yet Barker's grew a little lighter as he familiarized himself with it, or rather with Barker. He found that he had a plan for getting a teacher's place in the academy, if they reopened it, at Willoughby Pastures, as they talked of doing, under the impulse of such a course in one of the neighboring towns, and that he was going home, in fancy at least, with purposes of enlightenment and elevation which would go far to console him under such measure of disappointment as they must bring. Sewell hinted to Barker that he must not be too confident of remodeling Willoughby Pastures upon the pattern of Boston.

"Oh, no; I don't expect that," said Lemuel. "What I mean is that I shall always try

to remember myself what I've learnt here — from the kind of men I've seen, and the things that I know people are all the time doing for others. I told you once that they haven't got any idea of that in the country. I don't expect to preach it into them; they wouldn't like it if I did; and they'd make fun of it; but if I could try to *live* it?"

"Yes," said Sewell, touched by this young enthusiasm.

"I don't know as I can all the time," said Lemuel. "But it seems to me that that's what I've learnt here, if I've learnt anything. I think the world's a good deal better than I used to."

"Do you, indeed, my dear boy?" asked Sewell, greatly interested. "It's a pretty well meaning world — I hope it is."

"Yes, that's what I mean," said Lemuel. "I presume it ain't perfect — isn't, I should say," and Sewell smiled. "Mr. Corey was always correcting me on that. But if I were to do nothing but pass along the good that's been done me since I came here, I should be kept busy the rest of my life."

Sewell knew that this emotion was largely the physical optimism of convalescence; but he could not refuse the comfort it gave him to find Barker in such a mood, and he did not conceive it his duty to discourage it. Lofty ideals, if not indulged at the expense of lowly realities, he had never found hurtful to any; and it was certainly better for Barker to think too well than too ill of Boston, if it furnished him incentives to unselfish living. He could think of enough things in the city to warrant a different judgment, but if Barker's lesson from his experience there was this, Sewell was not the person to weaken its force with him. He said, with a smile of reserved comment, "Well, perhaps you'll be coming back to us, some day."

"I don't look forward to that," said Lemuel soberly; and then his face took a sterner cast, as if from the force of his resolution. "The first thing I've got to do after I've made a home for her is to get Statira away from the town where she can have some better air, and see if she can't get her health back. It'll be time enough to talk of Boston again when she's fit to live here."

The minister's sympathetic spirit sank again. But his final parting with Barker was not unhopeful. Lemuel consented to accept from him a small loan, to the compass of which he reduced the eager bounty of Miss Vane and Mr. Corey, representing that more would be a burden and an offense to Barker. Statira and his mother came with him to take leave of the Sewells.

They dismounted from the horse-car at the minister's door; and he saw, with sensibility,

the two women helping Lemuel off; he walked with a cane, and they went carefully on either side of him. Sewell hastened to meet them at the door himself, and he was so much interested in the spectacle of this mutual affection that he failed at first to observe that Mrs. Barker wore the skirts of occidental civilization instead of the bloomers which he had identified her with.

"She *says* she's goin' to put 'em on again as soon as she gets back to Willoughby," the younger woman explained to Mrs. Sewell in an aside, while the minister was engaged with Lemuel and his mother. "But I tell her as long as it ain't the fashion in Boston, I guess she hadn't better *he-e-e-re*." Statira had got on her genteel prolongation of her last syllables again. "I guess I shall get along with her. She's kind of queer when you first get acquainted, but she's *real* good-*heart-e-e-d*." She was herself very prettily dressed, and though she looked thin, and at times gave a deep, dismal cough, she was so bright and gay that it was impossible not to feel hopeful about her. She became very confidential with Mrs. Sewell, whom she apparently brevetted Lemuel's best friend, and obliged to a greater show of interest in him than she had ever felt. She told her the whole history of her love affair, and of how much 'Manda Grier had done to help it on at first, and then how she had wanted her to break off with Lemuel. "But," she concluded, "*I* think we're goin' to get along real nice together. I don't know as we shall live all in the same *hou-ou-se*; I guess it'll be the best thing for Lem and I if we can board till we get some little of our health back; I'm more scared for him than what I am for my-*se-e-lf*. I don't presume but what we shall both miss the city some; but he might be out of a job all winter in town; I shouldn't want he should go back on them *ca-a-rs*. Most I hate is leavin' 'Manda Grier; she is the one that I've roomed with ever since I first came to Boston; but Lem and her don't get on very well; they hain't really either of 'em *got* anything against each other, now, but they don't *like* very *we-e-ll*; and, of course, I got to have the friends that he wants me to have, and that's what 'Manda Grier says *to-o-o*; and so it's just as well we're goin' to be where they won't *cla-a-sh*."

She talked to Mrs. Sewell in a low voice; but she kept her eyes upon Lemuel all the time; and when Sewell took him and his mother the length of the front drawing-room away, she was quite distraught, and answered at random till he came back.

Sewell did not know what to think. Would this dependence warm her betrothed to greater

tenderness than he now showed, or would its excess disgust him? He was not afraid that Lemuel would ever be unkind to her; but he knew that in marriage kindness was not enough. He looked at Lemuel, serious, thoughtful, refined in his beauty by suffering; and then his eye wandered to Statira's delicate prettiness, so sweet, so full of amiable cheerfulness, so undeniably light and silly. What chiefly comforted him was the fact of an ally whom the young thing had apparently found in Lemuel's mother. Whether that grim personage's ignorant pride in her son had been satisfied with a girl of Statira's style and fashion, and proved capableness in housekeeping, or whether some fancy for butterfly prettiness lurking in the fastnesses of the old woman's rugged nature had been snared by the gay face and dancing eyes, it was apparent that she at least was in love with Statira. She allowed herself to be poked about, and rearranged as to her shawl and the narrow-brimmed youthful hat which she wore on the peak of her skull, and she softened to something like a smile at the touch of Statira's quick hands.

They had all come rather early to make their parting visit at the Sewells', for the Barkers were going to take the two o'clock train for Willoughby Pastures, while Statira was to remain in Boston till he could make a home for her. Lemuel promised to write as soon as he should be settled, and tell Sewell about his life and his work; and Sewell, beyond earshot of his wife, told him he might certainly count upon seeing them at Willoughby in the course of the next summer. They all shook hands several times. Lemuel's mother gave her hand from under the fringe of her shawl, standing bolt upright at arm's length off, and Sewell said it felt like a collection of corn-cobs.

xxxv.

"WELL?" said Sewell's wife, when they were gone.

"Well," he responded; and after a moment he said, "There's this comfort about it, which we don't always have in such cases: there doesn't seem to be anybody else. It would be indefinitely worse if there were."

"Why, of course. What in the world are you thinking about?"

"About that foolish girl who came to me with her miserable love-trouble. I declare, I can't get rid of it. I feel morally certain that she went away from me and dismissed the poor fellow who was looking to her love to save him."

"At the cost of some other poor creature who'd trusted and believed in him till his silly fancy changed? I hope for the credit of

women that she did. But you may be morally certain she did nothing of the kind. Girls don't give up all their hopes in life so easily as that. She might think she would do it, because she had read of such things, and thought it was fine, but when it came to the pinch, she wouldn't."

"I hope not. If she did she would commit a great error, a criminal error."

"Well, you needn't be afraid. Look at Mrs. Tom Corey. And that was her own sister!"

"That was different. Corey had never thought of her sister, much less made love to her, or promised to marry her. Besides, Mrs. Corey had her father and mother to advise her, and support her in behaving sensibly. And this poor creature had nothing but her own novel-fed fancies, and her crazy conscience. She thought that because she inflicted suffering upon herself she was acting unselfishly. Really, the fakirs of India and the Penitentes of New Mexico are more harmless, for they don't hurt any one else. If she has forced some poor fellow into a marriage like this of Barker's, she's committed a deadly sin. She'd better driven him to suicide, than condemned him to live a lie to the end of his days. No doubt she regarded it as a momentary act of expiation. That's the way her romances taught her to look at loveless marriage—*assomethings* spectacular, transitory, instead of the enduring, degrading, squalor that it is!"

"What in the world are you talking about, David? I should think *you* were a novelist yourself, by the wild way you go on! You have no proof whatever that Barker isn't happily engaged. I'm sure he's got a much better girl than he deserves, and one that's fully his equal. She's only too fond of that dry stick. Such a girl as the one you described,—like that mysterious visitor of yours,—what possible relation could she have with him? She was a lady!"

"Yes, yes! Of course it's absurd. But everybody seems to be tangled up with everybody else. My dear, will you give me a cup of tea? I think I'll go to writing at once."

Before she left her husband to order his tea Mrs. Sewell asked, "And do you think you have got through with him now?"

"I have just begun with him," replied Sewell.

His mind, naturally enough in connection with Lemuel, was running upon his friend Evans, and the subject they had once talked of in that room. It was primarily in thinking of him that he began to write his sermon on Complicity, which made a great impression at the time, and had a more lasting effect as enlarged from the newspaper reports, and reprinted in pamphlet form. His evolution from the text, "Remember them that are in bonds as bound with them," of a complete philoso-

phy of life, was humorously treated by some of his critics as a phase of Darwinism, but upon the whole the sermon met with great favor. It not only strengthened Sewell's hold upon the affections of his own congregation, but carried his name beyond Boston, and made him the topic of editorials in the Sunday editions of leading newspapers as far off as Chicago. It struck one of those popular moods of intelligent sympathy when the failure of a large class of underpaid and worthy workers to assert their right to a living wage against a powerful monopoly had sent a thrill of respectful pity through every generous heart in the country; and it was largely supposed that Sewell's sermon referred indirectly to the telegraphers' strike. Those who were aware of his habit of seeking to produce a personal rather than a general effect, of his belief that you can have a righteous public only by the slow process of having righteous men and women, knew that he meant something much nearer home to each of his hearers, when he preached the old Christ-humanity to them, and enforced again the lesson that no one for good or for evil, for sorrow or joy, for sickness or health, stood apart from his fellows, but each was bound to the highest and the lowest by ties that centered in the hand of God. No man, he said, sinned or suffered to himself alone; his error and his pain darkened and afflicted men, who never heard of his name. If a community was corrupt, if an age was immoral, it was not because of the vicious, but the virtuous who fancied themselves indifferent spectators. It was not the tyrant who oppressed, it was the wickedness that had made him possible. The gospel—Christ—God, so far as men had imagined him,—was but a lesson, a type, a witness from everlasting to everlasting of the spiritual unity of man. As we grew in grace, in humanity, in civilization, our recognition of this truth would be transfigured from a duty to a privilege, a joy, a heavenly rapture. Many men might go through life harmlessly without realizing this, perhaps, but sterilely; only those who had had the care of others laid upon them, lived usefully, fruitfully. Let no one shrink from such a burden, or seek to rid himself of it. Rather let him bind it fast upon his neck, and rejoice in it. The wretched, the foolish, the ignorant whom we found at every turn, were something more; they were the messengers of God, sent to tell his secret to any that would hear it. Happy he in whose ears their cry for help was a perpetual voice, for that man, whatever his creed, knew God, and could never forget him. In his responsibility for his weaker brethren he was Godlike, for God was but the impersonation of loving responsibility, of infinite and never-ceasing care for us all.

WHEN Sewell came down from his pulpit, many people came up to speak to him of his sermon. Some of the women's faces showed the traces of tears, and each person had made its application to himself. There were two or three who had heard between the words. Old Bromfield Corey, who was coming a good deal more to church since his eyes began to fail him, because it was a change and a sort of relief from being read to, said:

"I didn't know that they had translated it Barker in the revised version. Well, you must let me know how he's getting on, Sewell, and give me a chance at the revelation too, if he ever gets troublesome to you again."

Miss Vane was standing at the door with his wife when Sewell came out. She took his hand and pressed it.

"Do you think I threw away my chance?" she demanded. She had her veil down, and at first Sewell thought it was laughter that shook her voice, but it was not that.

He did not know quite what to say, but he did say, "He was sent to *me*."

As they walked off alone, his wife said:

"Well, David, I hope you haven't preached away all your truth and righteousness."

"I know what you mean, my dear," answered Sewell humbly. He added, "You shall remind me, if I seem likely to forget." But he concluded seriously, "If I thought I could never do anything more for Barker, I should be very unhappy; I should take it as a sign that I had been recreant to my charge."

XXXVI.

THE minister heard directly from Barker two or three times during the winter, and as often through Statira, who came to see Mrs. Sewell. Barker had not got the place he had hoped for at once, but he had got a school in the country a little way off, and he was doing something; and he expected to do better.

The winter proved a very severe one. "I guess it's just as well I staid in town," said Statira, the last time she came, with a resignation which Mrs. Sewell, fond of the ideal in others, as most ladies are, did not like. "'Manda Grier says 'twould killed me up there; and I d' know but what it would. I done so well here, since the cold weather set in, that 'Manda Grier she thinks I hadn't better get married right away; well, not till it comes summer, anyway. I tell her I guess she don't want I should get married at all, after all she done to help it along first off. Her and Mr. Barker don't seem to get along very well."

Now that Statira felt a little better acquainted with Mrs. Sewell, she dropped the

genteel elongation of her final syllables, and used such vernacular forms of speech as came first to her. The name of 'Manda Grier seemed to come in at every fourth word with her, and she tired Mrs. Sewell with visits which she appeared unable to bring to a close of herself.

A long relief from them ended in an alarm for her health with Mrs. Sewell, who went to find her. She found her still better than before, and Statira frankly accounted for her absence by saying that 'Manda thought she had better not come any more till Mrs. Sewell returned some of her calls. She laughed, and then she said:

"I don't know as you'd found me here if you'd come much later. 'Manda Grier don't want I should be here in the east winds, now it's comin' spring so soon; and she's heard of a chance at a box factory in Philadelphia. She wants I should go there with her, and I don't know but what it *would* be about the best thing."

Mrs. Sewell could not deny the good sense of the plan, though she was sensible of liking Statira less and less for it.

The girl continued: "Lem — Mr. Barker, I *should* say — wants I should come up *there*, out the east winds. But 'Manda Grier she's opposed to it; she thinks I'd ought to have more of a mild climate, and he better come down *there* and get a school, if he wants me *to-o*." Statira broke into an impartial little titter. "I'm sure I don't know which of 'em 'll win the day!"

Mrs. Sewell's report of this speech brought a radiant smile of relief to Sewell's face. "Ah, well, then! That settles it! I feel perfectly sure that 'Manda Grier will win the day. That poor, sick, flimsy little Statira is completely under 'Manda Grier's thumb, and will do just what she says, now that there's no direct appeal from her will to Barker's; they will never be married. Don't you see that it was 'Manda Grier's romance in the beginning, and that when she came to distrust, to dislike Barker, she came to dislike her romance too — to hate it?"

"Well, don't *you* romance him, David," said Mrs. Sewell, only conditionally accepting his theory.

Yet it may be offered to the reader as founded in probability and human nature. In fact, he may be assured here that the marriage which eventually took place was not that of Lemuel and Statira; though how the union, which was not only happiness for those it joined, but whatever is worthier and better in life than happiness, came about, it is aside from the purpose of this story to tell, and must be left for some future inquiry.

JEANNE D'ARC. (AFTER THE STATUE BY CHAPU IN THE LUXEMBOURG.)

CONTEMPORARY FRENCH SCULPTURE.

CHAPU — DUBOIS.

GREEK sculpture has perished so completely that it sometimes seems to live only in its legend. It is quite supplanted by the sculpture of the Renaissance. And this is not unreasonable. The Renaissance sculpture is modern; its masters did finely and perfectly what since their time has been done imperfectly, but essentially its artistic spirit is the modern artistic spirit, full of personality, full of expression, careless of the type. Nowadays we patronize a little the ideal. You may hear very intelligent critics in Paris — who in Paris is not an intelligent critic? — speak disparagingly of the Greek want of expression; of the lack of passion, of vivid interest, of significance in a word, in Greek sculpture of the Periclean epoch. The conception of absolute beauty having been discovered to be an abstraction, the tradition of the purely ideal has gone with it. The caryatids of the Erechtheum, the horsemen of the Parthenon frieze, the reliefs of the Nike Apteros balustrade are admired certainly; but they are hardly sympathetically admired; there is a tendency to relegate them to the limbo of subjects for æsthetic lectures. And yet no one can have carefully examined the brilliant productions of French sculpture without being struck by this apparent paradox: that, whereas all its canons are drawn from a study of the Renaissance, its chief characteristic is, at bottom, a lack of expression, a careflessness for the type. The explanation is this: in the course of time, which “at last makes all things even,” the individuality, the romanticism of the Renaissance has itself become the type, is now itself become “classical,” and the modern attitude towards it, however sympathetic compared with the modern attitude towards the antique, is to a noteworthy degree factitious and artificial. And in art everything depends upon the attitude of mind. It is this which prevents Ingres from being truly Raphaellesque and Pradier from being really classical. If, therefore, it can justly be said of modern French sculpture that its sympathy for the Renaissance sculpture obscures its vision of the ideal, it is clearly to be charged with the same absence of individual significance with which its thick-and-thin partisans

reproach the antique. The circumstance that, like the Renaissance sculpture, it deals far more largely in pictorial expression than the antique does, is, if it deals in them after the Renaissance fashion and not after a fashion of its own, quite beside the essential fact. There is really nothing in common between a French sculptor of the present day and an Italian one of the fifteenth century except the possession of what is called the modern spirit. But the modern spirit manifests itself in an enormous gamut, and the differences of its manifestations are as great in their way, and so far as our interest in them is concerned, as the difference between their inspiration and the mediæval or the antique inspiration.

M. Chapu is perhaps the only eminent sculptor of the time whose inspiration is clearly the antique, and when I add that his work appears to me for this reason none the less original, it will be immediately perceived that I share imperfectly the French objection to the antique. Indeed, nowadays to have the antique inspiration is to be original *ex vi termini*; nothing is further removed from contemporary conventions. But this is true in a much more integral sense. The preëminent fact of Greek sculpture, for example, is, from one point of view, the directness with which it concerns itself with the ideal — the slight temporary or personal element with which it is alloyed. When one calls an artist or a work Greek, this is what is really meant; it is the sense in which Raphael is Greek, or (to associate lesser things with great, and if I may say so without being misunderstood) the work of Mr. Whistler. M. Chapu is Greek in this way, and thus individualized among his contemporaries, not only by having a different inspiration from them, but by depending for his interest on no convention fixed or fleeting and on no indirect support of accentuated personal characteristics. Perhaps the antiquary of a thousand years from now, to whom the traits which to us distinguish so clearly the work of certain sculptors who seem to have nothing in common will betray only their common inspiration, will be even less at a loss than ourselves to find traces of a common origin in such apparently different works as M. Chapu's “Mercury” and his “Jeunesse” of the Regnault monument. He will by no means confound these with the classical productions of M. Millet or

MILITARY COURAGE. (ENGRAVED BY H. WOLF, AFTER THE STATUE BY DUBOIS AT THE TOMB OF LAMORICIÈRE, NANTES.)

M. Cavelier, we may be sure. And this, I repeat, because their purely Greek spirit, the subordination in their conception and execution of the personal element, the direct way in which the sculptor looks at the ideal, the type, not only distinguish them among contemporary works, which are so largely personal expressions, but give them an eminent individuality as well. Like the Greek sculpture, they are plainly the production of culture, which in restraining willfulness, however happily inspired, and imposing measure and poise, nevertheless acutely stimulates and develops the faculties themselves. The skeptic who may very plausibly inquire the distinction between that vague entity, "the ideal," and the personal idea of the artist concerned with it, can be shown this distinction better than it can be expressed in words. He will appreciate it very readily, to return to M. Chapu, by contrasting the *Jeanne d'Arc* at the Luxembourg gallery with such different treatment of the same theme as M. Bastien-Lepage's picture, as well known in America as in Paris, illustrates. Contrary to his almost invariable practice of neglecting even design in favor of impersonal natural representation, M. Bastien-Lepage's "*Jeanne d'Arc*" is the creature of willful originality, a sort of embodied protest against conventionalism in historical painting; she is the illustration of a theory, she is this and that systematically and not spontaneously; the predominance of the painter's personality is plain in every detail of his creation. M. Chapu's "*Maid*" is the ideal, more or less perfectly expressed. She is everybody's "*Maid*," more or less adequately embodied. The statue is the antipodes of the conventional; it suggests no competition with that at Versailles or the many other characterless conceptions which abound. It is full of expression — arrested just before it ceases to be suggestive; of individuality restrained on the hither side of peculiarity. The "*Maid*" is hearing her "voices" as distinctly as M. Bastien-Lepage's figure is, but the fact is not forced upon the sense, but is rather disclosed to the mind with great delicacy and the dignity becoming sculpture. No one could, of course, mistake this work for an antique, — an error that might possibly be made, supposing the conditions favorable, in the case of M. Chapu's "*Mercury*"; but it presents, nevertheless, an excellent illustration of a modern working naturally and freely in the antique spirit. It is as affecting, as full of direct appeal, as a modern work essays to be; but its appeal is to the sense of beauty, to the imagination, and its effect is wrought in virtue of its art and not of its reality. No, individuality is no more inconsistent with the antique spirit than it is with

eccentricity, with the extravagances of personal expression. Is there more individuality in a thirteenth-century grotesque than in the *Faun* of the Capitol? For sculpture especially, art is eminently, as it has been termed, "the discipline of genius," and it is only after the sculptor's genius has submitted to the discipline of culture that it evinces an individuality which really counts, which is really thrown out in relief on the background of crude personality. And if there be no question of perfection, but only of the artist's attitude, one has but to ask himself the real meaning of the epithet *Shaksperian* to be assured of the harmony between individuality and the most impersonal practice.

Nevertheless, this attitude and this perfection, characteristic as they are of M. Chapu's work, have their peril. When the quickening impulse, of whose expression they are after, all but conditions, fails, they suddenly appear so misplaced as to render insignificant what would otherwise have seemed "respectable" enough work. Everywhere else of great distinction, — even in the execution of so perfunctory a task as a commission for a figure of "*Mechanical Art*" in the *Tribunal de Commerce*, at the great *Triennial Exposition* of 1883, — M. Chapu was simply insignificant. There was never a more striking illustration of the necessity of constant renewal of inspiration, of the constant danger of lapse into the perfunctory and the hackneyed, which threatens an artist of precisely M. Chapu's qualities. Another of equal eminence escapes this peril; there is not the same interdependence of form and "content" to be disturbed by failure in the latter; or, better still, the merits of form are not so distinguished as to require imperatively a corresponding excellence of intention. In fact, it is for the exceptional position that he occupies in deriving from the antique, instead of showing the academic devotion to Renaissance romanticism which characterizes the general movement of modern French sculpture, that in any consideration of this sculpture M. Chapu's work makes a more vivid impression than that of his contemporaries, and thus naturally takes a foremost place.

M. Paul Dubois, for example, is as unmistakably "arrived," as the phrase is, as M. Chapu, to whom, in the characteristics just treated of, he presents the greatest possible contrast; but he will never, we may be sure, give us a work that could be called insignificant. His work will always express himself, and his is a personality of very positive idiosyncrasies. M. Dubois, indeed, is probably the strongest of the Academic group of French sculptors of the day. The tomb of General Lamoricière at Nantes has remained until recently probably the finest achievement

LA JEUNESSE. (ENGRAVED BY J. H. E. WHITNEY, AFTER THE REGNAULT MONUMENT BY CHAPU IN THE BEAUX-ARTS.)

THE INFANT JOHN. (ENGRAVED BY C. A. POWELL, AFTER THE STATUE BY DUBOIS IN THE LUXEMBOURG.)

of sculpture in modern times. There is in effect nothing markedly superior in the Cathedral of St. Denis, which is a great deal to say—much more, indeed, than the glories of the Italian Renaissance, which lead us out of mere momentum to forget the French, permit one to appreciate. Indeed, the sculpture of M. Dubois seems positively to have but one defect, a defect which from one point of view is certainly a quality, the defect of impeccability. It is at any rate impeccable; to seek in it a blemish, or, within its own limitations, a distinct shortcoming, is to lose one's pains. As workmanship, and workmanship of the subtler kind, in which every detail of surface and structure is perceived to have been intelligently felt (though rarely enthusiastically rendered), it is not merely satisfactory, but visibly and beautifully perfect. But in the category in which M. Dubois is to be placed that is very little; it is always delightful, but it is not especially complimentary to M. Dubois, to occupy one's self with it. On the other hand, by impeccability is certainly not here meant the mere success of expressing what one has to express—the impeccability of Canova and his successors, for example. The difficulty is with M. Dubois's ideal, with what he so perfectly expresses. At the last analysis this is not his ideal more than ours. And this, indeed, is what makes his work so flawless in our eyes, so impeccable. It seems as if of what he attempts he attains the type itself; every one must recognize its justness.

The reader will say at once here that I am caviling at M. Dubois for what I praised in M. Chapu. But let us distinguish. The two artists belong to wholly different categories. M. Chapu's inspiration is the antique spirit. M. Dubois is, like all French sculptors except M. Chapu indeed, absolutely and integrally a romanticist, completely enamored of the Renaissance. The two are so distinct as to be contradictory. The moment M. Dubois gives us the *type* in a "Florentine Minstrel," to the exclusion of the personal and the particular, he fails in imaginativeness and falls back on the conventional. The *type* of a "Florentine Minstrel" is infallibly a convention. M. Dubois, not being occupied directly with the ideal, is bound to carry his subject and its idiosyncrasies much farther than the observer could have foreseen. To rest content with expressing gracefully and powerfully the notion common to all connoisseurs is to fall short of what one justly expects of the romantic artist. Indeed, in exchange for this one would accept very faulty work in this category with resignation. Whatever we may say or think, however we may admire or approve, in romantic art the quality that charms, that fascinates, is not adequacy but unexpectedness. In addition to the under-

standing, the instinct demands satisfaction. The virtues of Charity and Faith and the ideas of Military Courage and Meditation could not be more adequately illustrated than by the figures which guard the solemn dignity of General Lamoricière's sleep. There is a certain force, a breadth of view, in the general conception, something in the way in which the sculptor has taken his task, quite as nearly allied to real grandeur as anything of the sort in contemporary art. Even in painting, I think of nothing so justly to be called grand since Delacroix. The confident and even careless dependence upon the unaided value of its motive, making hardly any appeal to the fancy on the one hand and seeking no poignant effect on the other, endues the work with the poise and purity of superb strength. It conveys to the mind a clear impression of manliness, of qualities morally refreshing.

But such work educates us so inexorably, teaches us to be so exacting! After enjoying it to its and our utmost, we demand still something else, something more moving, more stirring, something more directly appealing to our impulse and instinct. Even in his free and charming little "St. John Baptist" of the Luxembourg and his admirable bust of Baudry one feels like asking for more freedom still, for more "swing." Dubois certainly is the last artist who needs to be on his guard against "letting himself go." Why is it that in varying so agreeably Renaissance themes—compare the "Military Courage" and Michael Angelo's "Pensiero," or the "Charity" and the same group in Della Quercia's fountain at Siena,—it is restraint, rather than audacity, that governs him? Is it caution or perversity? In a word, imaginativeness is what permanently interests and attaches, the imaginativeness to which in sculpture the ordinary conventions of form are mere conditions, and the ordinary conventions of idea mere material. One can hardly apply generalities of the kind to M. Dubois without saying too much, but it is nevertheless true that one may illustrate the grand style and yet fail of being intimately and acutely sympathetic; and M. Dubois, to whose largeness of treatment and nobility of conception no one will deny the grand style, does thus fail. It is not that he does not possess charm, and charm in no mean proportion to his largeness and nobility, but for the elevation of these into the realm of magic, into the upper air of spontaneous spiritual activity, his imagination has, for the romantic imagination which it is, a trifle too much self-possession,—too much sanity, if one chooses. He has the ambitions, the faculties, of a lyric poet, and he gives us too frequently recitative.

THE COWARD.

A COWARD.

UTSIDE the July sunshine was blazing down upon the bare parade ground, the low frame houses, and the rough defenses which make up the unpicturesque ensemble of a fort in Mon-

tana; but inside the Colonel's quarters Evelyn Blake, though it was only a month since she had joined her father, had managed to make her home as dainty and as pretty as if civilization and upholsterers were not two hundred miles away.

"She is a woman like her mother, who would make an Indian 'dug-out' cozy if she lived in it for a week," her father said to himself, gazing fondly at her over the lunch-table. "When one thinks, too, that the little witch lost half her boxes on the way, and that the piano had so many narrow escapes that its safe arrival seems, as Jack Peyton says, a miracle vouchsafed to the prayers of the whole regiment ——"

"Papa," said Miss Blake, lifting her blue eyes from the tea-cup she had been meditatively regarding, "suppose we ask Mr. Fleming to dine with us to-morrow?"

"Fleming?" repeated the Colonel, his beaming countenance clouding a little. "I think not to-morrow: we have asked Frost, you know, and they are not particularly good friends."

"We really should not put him off any longer, though he seems as difficult to arrange with the other officers as the fox, the goose, and the basket of corn. You must see, papa, that if we are to keep to your rule of asking each of the unmarried officers in turn to dine with us on Sundays, we cannot make an exception of Mr. Fleming."

"But we do not know Fleming as well as the other fellows."

"Shall we ever know him any better if we are so pointedly rude to him? Papa," cried Evelyn, folding her pretty arms upon the table, and confronting her parent quite judicially, "I am afraid that you have a prejudice against Mr. Fleming; and I have often heard you say that a commanding officer should not permit himself such a luxury."

"Oh, my dear! I have said a great many wise things in my time that I find impossible to practice."

"But what makes him so unpopular? One never sees him except at parade; his brother officers never speak of him; he has never

even been to call upon me but once, and that evidently as a matter of duty," said Evelyn, announcing this climax of peculiarity with all the well-justified surprise of the only young lady of a garrison, who had possessed a monopoly of the time and devotion of the unmarried officers of the regiment ever since her arrival. "What has he done?"

The Colonel pulled his gray mustache thoughtfully.

"You will be sure to hear the story sooner or later," he said rather ruefully. "And I dare say, prejudiced though you think me, that I shall tell it to you more fairly than one of those youngsters, who understand nothing between their own reckless courage and downright poltroonery."

"What do you mean, papa?"

"I mean that for three years Fleming has lived under the stigma of cowardice—that there is not a man in the regiment who does not believe that his cowardice cost a comrade his life." Then, in a voice that grew very stern as he proceeded, he told her the story.

Three years before the regiment had been stationed in Arizona, where the Indians had for several months been giving a great deal of trouble. Toward the end of the summer, however, everything had become quieter, and detachments had been sent from post to post without meeting with any attempt at hostility, even when their numbers were imprudently small. In the latter part of August Fleming and another officer named Lawrence, with ten soldiers, were sent to the west fort for some purpose, and had nearly reached home on their return, and, fancying themselves in security, had somewhat relaxed their vigilance, when from behind some rocks a band of Indians, three or four times their number, rushed upon them with a discharge of musketry. Two soldiers were killed instantly, and Fleming, who was in command, ordered his men to put their horses to the gallop. As they did so, Lawrence's horse was shot, and the Indians dashed towards him as he struggled to free himself, crying to his comrades to help him. The soldiers declared afterwards that, had Fleming given the word promptly, there would have been time to mount Lawrence behind one of them, and that any of the horses would have been equal to the double load for the short distance necessary to put them beyond the reach of the Indians, who did not dare to follow them very near the fort. But Fleming

had heeded neither Lawrence's cry for help nor the appeals of the soldiers nearest him, ordering the latter to be silent and save themselves, while he put his own horse to such a speed that the others could scarcely keep up with him. They arrived at the fort within half an hour, the men in such a state of indignation that every one in the garrison was soon acquainted with the story, and Fleming a disgraced man. The only reason that he had not been court-martialed at once was that there had been no officer with him to bear testimony, and it was considered too dangerous a precedent to allow soldiers to witness against an officer. Fleming had therefore kept his rank, shunned by his comrades, who felt that in so doing only could they avenge Lawrence's death, and treated, so far as he could govern his manner, with impartiality by Colonel Blake, who in his own gallant heart despised the man he considered a coward even more utterly than the younger men, who showed their contempt so plainly.

"Have you ever spoken to him about it, papa?" Evelyn asked when the story was ended. A little of her pretty color had faded, for the Colonel told the story well, and it had seemed to her almost as though she had seen the Indians sweeping around Lawrence as he fell, and heard his last cry for help drowned in the gallop of his comrades' horses as they deserted him.

"Yes, child, once. He asked to take charge of a scouting party which, after consulting the Major, I had given to Jack Peyton."

"What did you say to him?"

"I told him the story as I had heard it, and that, believing it as I did, I could not trust my men to an officer who lost his self-possession in a moment of danger; and further, that the men, having no confidence in him, could not be relied upon to do their duty under his command as they could under any other."

"Was he angry? Did he deny?"

"Angry?—deny?" repeated the Colonel gloomily. "He put his head down on the table and cried like a child. Presently he said that no one could blame him more severely than he did himself, and that he should have resigned at once, feeling his unfitness for the service, and realizing the reason why he had not been dismissed by court-martial, but that in so doing he must have told the story to his father (you have heard of what a brave old soldier General Fleming is), and that it would have broken the old man's heart. So he asked my patience while his father lives, promising to resign upon his death, and that in the mean time, in any duty for which I might think him fit, he would prove to me that he could at least work."

"And has he kept his word?"

"Perfectly. No men are better drilled or cared for than his; and when the regiment was ordered here two years ago, he proved that he had more organizing and executive ability than all the other youngsters together; while as regards the attractions at the post-trader's, where cards and drink ruin some of our best fellows, he is an example to his comrades—an example which will, however, have no good effect upon them while they consider him a coward."

"A coward! Poor fellow, he has moral courage enough for a hero! To do his duty for three years, and live solitary and despised among you all, for the sake of saving his brave old father's shame!"

"You are the first woman I ever knew who found an excuse for cowardice," the Colonel said, rising vexedly, for Fleming was rather a pet grievance with him, and he had been sure of Evelyn's sympathy in it.

"I cannot believe that a man who is so brave morally can be an utter coward physically. There must have been some reason for his conduct," she cried, rising too, and clasping both hands over her father's arm.

"He gave none."

"Because he was overwhelmed with regret. I have heard that even the bravest men have confessed to a moment of panic. Dear papa, give him another chance!"

"The Major would like to see you, Colonel," said an orderly entering. "And, Miss Blake, I showed Lieutenant Fleming into the drawing-room just now."

"Good Heavens!" cried the Colonel aghast, for the drawing-room adjoined the dining-room, and the door between was ajar. With a lamentable lack of the moral courage his daughter so much admired, he rushed into the hall, where he could be heard eagerly ushering the Major into his own particular den, while Evelyn, pale with sympathy, entered the drawing-room.

Fleming came to meet her with a smile that made her eyes fill with tears.

"I do not add eavesdropping to my other faults usually," he said in a voice which trembled a little. "But the first words I heard were yours in my excuse, and I could not help waiting to hear what you could say for me—I who can say nothing for myself!"

"It was a moment's panic," faltered Evelyn. "If you had realized the consequences—"

"I realized nothing—I was mad with fear," Fleming said with a bitterness all the more intense for its quietness. "If my horse had been shot and Lawrence in command, there would have been no moment's panic with him."

"They should give you another chance. It is not just to spoil your life for one fault."

"It was a fault which cost a life worth infinitely more than mine; and if your father were to give me the opportunity I asked for, it might cost more lives than one. No! he is right."

"It would never happen again!" cried Evelyn, carried beyond remembrance of conventionalities by keenest pity for the hopeless regret in his eyes and voice; and, clasping Fleming's strong brown hand in both of hers, she said:

"You have suffered so deeply, and have done your duty so faithfully in spite of this injustice, that I believe the dear God, who is so much more forgiving to us than we are to each other"—with a reverent lowering of the tender voice—"He will give you a chance of redeeming your fault, if only you do not lose patience."

With an inarticulate exclamation, Fleming pressed his lips to the pretty hands which held his so kindly, and hurriedly left the room.

From that afternoon it became evident to the garrison that Fleming had joined the ranks of Miss Blake's courtiers, and that she had relaxed in his favor her hitherto rigid impartiality. As her favor was just then the boon most highly prized, and as human nature is no more faultless in a frontier post than in wider circles, it followed naturally that she was several times told Fleming's story far less justly than she had heard it from her father. Her invariable reply, that she considered him most unjustly treated until he should have an opportunity to retrieve his reputation, was set down as a proof that, for the sake of his handsome melancholy eyes and his utter devotion to herself, she had forgiven him a fault which a woman usually finds as difficult to pardon as a soldier; and every one was prepared to hear of an engagement between the most popular and the most disliked persons in the regiment. That this did not add to Fleming's favor with his comrades was also most human; and Colonel Blake, when he saw Evelyn grasping every occasion of showing her preference, felt his heart also harden still more against the man whom of all others he would most object to seeing his only child marry.

"My little girl," he said one August evening when Evelyn had returned from a long ride in which Fleming had been her escort, "do not give me a coward for a son-in-law."

"Papa, you are a goose," she cried most disrespectfully, leaning over his arm-chair as she stood beside him, and kissing the top of his gray head, where a much-lamented baldness was beginning to appear.

"Oh, my dear! if your mother had lived, she would have known how to say to you the wise things that mothers understand and that girls need to hear," the Colonel said with an unwonted tremor in his cheery voice. "But though I do not know much about girls, I do

know men; and I tell you that an officer who thinks only of himself in a moment of danger and forgets the lives under his care—that man is not the husband a woman should trust with her future."

"Try to keep your thoughts from matrimony, you absurd old dear, and take my word that nobody is thinking about it but yourself," Evelyn cried gayly, and unblushingly meeting her father's anxious eyes. Then she added gravely, "If you could have seen how well Mr. Fleming managed Sultan, who really has rather a nasty temper. There is not another officer in the regiment who can manage a horse so well—he is so firm and so quiet."

"Nonsense! Jack Peyton is as much his superior in horsemanship as he is in courage and every other quality that one would expect a woman to admire."

"There is no question of Mr. Peyton," replied Evelyn with a sudden rush of color. "However, as you choose to compare the two, papa, please believe that I infinitely prefer Mr. Fleming as my friend to Mr. Peyton." And with another light kiss she left the room.

As Fleming came out of the officers' mess-room that same August evening, the beauty of the cloudless moonlight tempted him from an immediate return to the books which had been his society and friends for three years, and he walked slowly to a portion of the fort which overlooked the Yellowstone River. Six or eight of the trees planted in the open space there four years before, when Fort Barton was built, still survived their struggles with arctic winters and tropical summers; and as there were a couple of benches within their scanty shade, and the view from the bluff was wonderfully grand, this end of the parade was a favorite resort among the younger officers in fine weather. On this evening there was only one figure on the most distant bench, and he, apparently, had come neither to encourage the trees, admire the view, nor smoke a cigar; for with his elbows on his knees, and his head resting on his clasped hands, he certainly was not indulging in any of those amusements popular among the frequenters of the place.

At the sound of a step he raised himself and stared silently at Fleming.

"Good evening, Peyton."

"I beg your pardon; I was half asleep and hardly knew you," Jack Peyton said mendaciously, for he had never been more keenly awake, and he had recognized Fleming with that quickness with which we all recognize the subject of recent disagreeable thoughts. "Just returned from your ride with Miss Blake?"

"Half an hour ago."

Peyton rose, and picking up a couple of

small loose stones from the rampart, he flung them singly into the river far below.

"When is one to congratulate you and Miss Blake?" he asked abruptly and with his back to Fleming.

There was a pause — a pause in which an iron hand seemed laid on Fleming's heart, so absolutely physical was its pain; a pause through which, somewhere in that inmost consciousness we call a soul, he heard a whisper that the merest hint would keep proud Jack Peyton from Evelyn Blake, and that well as he knew the hopelessness of his own love then, yet in time —

"I am not much in the line of congratulations," he said hoarsely at last. "As for Miss Blake — God bless her! — do not you see that she is only sorry for me? Do you think that so true a woman as she is would publish her kindness to me through the whole regiment as she does, if she had any deeper feeling for me than the wish to show you all that I have one friend who trusts me? When she loves she will not begin with pity." And, having uttered these last words with a bitterness Peyton never forgot, he walked away to his quarters.

A week later the announcement of Miss Blake's engagement to Jack Peyton paralyzed the garrison with another proof of the inscrutability of woman's purpose, and established the Colonel in his rather shaken belief that her mother's daughter could not do a foolish thing — especially in the choice of a husband. As for Fleming, he went about his duties with the same quiet absorption in them which had been his chief characteristic for three years, and the friendship between him and Evelyn continued as warmly eager on her side, as gravely grateful on his, as it had been before her engagement, though at the cost of many remonstrances from Peyton, who fully shared the general opinion of Fleming.

The winter came unusually early even for Montana, and with certain peculiarities in its advent which made those of the officers most familiar with the climate predict a very severe season — a prediction of gloomy portent where winter at best meant nearly six months' isolation, with infrequent and irregular mails, brought by half-frozen carriers on horseback, for their only link with the world beyond the prairies; for, though there were telegraph lines to Chicago, as well as to the neighboring forts, the winter "blizzards" were apt to destroy their efficiency for weeks at a time. Between Christmas and New-Year's the marriage of Miss Blake was to occur, and every one looked forward to that event as to the only oasis in the long desert of winter dullness, because, if the weather proved endurable, two or three young ladies from their largest neigh-

bor, Fort Bryan, had promised to come over for a week under the chaperonage of the commander's wife; and the prospect of several pretty bridesmaids sustained the spirits of the younger officers, who had found it hard to forgive even so popular a man as Jack Peyton for his monopoly of Miss Blake.

A few days before Christmas the weather, which had been stormy for some time, cleared encouragingly; and having telegraphed Fort Bryan that they were on their way, Peyton with Fleming (whom, as a great concession to Evelyn, he asked to go with him), and accompanied by two orderlies, set out to meet the ladies at Fort Bryan and escort them across the prairies. After a cold, bright ride of nearly six hours they arrived at a ranch half way between the two forts, where they were to pass the night. They were met by the ranchman with a telegram from Fort Bryan, telling them that the road beyond was impassable for the ambulance, in which the ladies had intended to travel, and asking them to proceed no further, as more snow might be expected, and they had with great regret given up their plan of coming to the wedding.

It was vexatious, but Peyton found some rather malicious amusement in picturing the blank faces of their expectant comrades when they should behold him and Fleming returning without the long-desired bridesmaids on the next day. The next day dawned, however, on a heavy snow-storm, which endured without intermission for three days, and kept them prisoners at the ranch, while, to add to the contrariety of events, Fleming's orderly became ill with pleurisy.

The fourth day was Christmas Eve, and they woke, not indeed to a storm, but to heavy leaden clouds which meant more snow presently. The ranchman shook his head rather gravely when Peyton at breakfast announced that he and Fleming had decided to return to Fort Barton, leaving his orderly to take care of his comrade.

"Well," he said, tilting his chair comfortably, "I guess I should stay here if I was you. I have been in Montana about as long as any white man, and ought to know this cussed climate pretty well, and I reckon on the worst kind of a blizzard inside of four hours — which I would not start in the face of a blizzard unless I was more tired of life than I have been yet!"

"To-morrow will be Christmas," began Peyton, looking doubtfully at Fleming.

"If the snow commences again, it may last a week, and you are to be married in three days," Fleming said with a grave smile.

"It is right-down hard, gentlemen," said the ranchman with a sympathetic twist of his hard features, "but — —"

"There can be no 'buts' about my going; I shall start at once," said Peyton, rising. "For you, Fleming, of course it is different—you are not to be married in three days."

"Nevertheless I have every desire to spend Christmas at Fort Barton," Fleming replied, rising also, with a sudden flush on his dark face. "If we lose no time in starting and our horses behave well, I think we shall get there before the blizzard does."

The ranchman shook his head again, but he liked pluck, and even his rough heart was stirred by that interest in a wedding which is as wide as the world; so he wished them good luck, and remonstrated no more.

Within half an hour the two officers started, so wrapped up in their buffalo coats and caps that their own mothers would not have recognized them. It was not very cold,—that is, as two winters of Montana had taught them to appreciate cold,—and in spite of the drifted snow, which had obliterated the road, they kept close to the telegraph poles as certain landmarks; and their horses being in excellent condition, they made rapid progress during the first half of their journey. They lunched on two huge smoked venison sandwiches, and drank cheerily from the brandy in their pocket-flasks to the quantity and quality of their supper at Fort Barton. But scarcely had they started again when the first flakes of snow began to fall, the wind rose in sharp squalls, and though it was not yet three o'clock, the day rapidly darkened. The men drew in their horses as if by one impulse, and looked fixedly for an instant at what was visible of each other's countenance between the tops of their fur collars and the edge of their caps.

"I am sorry to have brought you into this," Peyton said abruptly. "This is certainly the beginning of a blizzard, and if it at all resembles the rest of its family, there is nothing more uncertain than whether you and I will see the end of it."

"You can have no responsibility about me, for you would have left me at the ranch this morning if I had consented," Fleming answered, meeting all the doubtful pity in Jack's gaze with eyes full of pained comprehension, but quite as unflinching as his own. "As for our seeing the end of this, it is a question of endurance, I believe. If our horses hold out and the wind should not prove too strong for the telegraph poles, we shall do very well."

Then, agreeing to let the horses take their own pace, they set out again. Two winters of Montana had made them both aware that the blizzard is the most deadly of prairie dangers, and they had heard many a ghastly story of the victims it makes every year among the hardy and weather-beaten frontiersmen, who

alone dare expose themselves to the chance of being caught in its bitter and breathless embrace; but it required a very brief experience to prove to them that the reality was far more terrible than their worst anticipations. The snow was hurled in their faces with a force blinding both to them and to their horses, by a wind which rushed over the prairies with the uproar and violence of a storm at sea, while the darkness increased and the cold grew more intense with every moment. They came to another pause presently, and decided that one should wait at one telegraph pole until the other, riding on, should call that he had arrived at the next—a manœuvre which, though it cost much time and tried the patience of the horses sorely, was made necessary by the darkness, and their knowledge that it would be fatal to wander from the telegraph poles, their only landmarks in that waste of whirlingsnow. Peyton's horse, which was young and nervous, soon became very difficult to manage, and his rider had been having much trouble with him for some little time, when Fleming, whose turn it was to wait while Peyton rode on, heard a heavy crash, and then, after an instant, the sound of a horse rushing off at speed.

"Peyton!" he cried, making a trumpet of his hands; but there was no reply—no sound but the shriek of the wind; even the gallop of the escaping horse was swallowed up. A great horror of desolation sank down upon Fleming in the darkness and bewilderment of a chaos almost as utter as that which covered the face of the world before the word of God had made it fair. Close by, Peyton was lying dead or senseless. Why should he, who was unwanted, unlooked for, seek to save himself to endure more such years as these last three, when the other and happier man had perished? How could he meet Evelyn Blake,—the one soul that had had pity on him,—and tell her that he had left the man she loved to die in the snow? Better let himself drop from the frightened horse trembling beneath him and die with Peyton. Suddenly a strange thrill shot through his heart. Out of the darkness two pitiful woman's eyes looked into his, and through all the roar of the tempest a tender woman's voice seemed to utter again the words that had been a revelation of hope to him months since—"God himself will give you the chance of atonement that men deny you!" Fool—coward, that he was! God had sent him the chance, not only to redeem his past, but to save her happiness, and he had been about to let it slip from him forever, because he had not courage to grasp it.

"O God!" he cried passionately, turning his face up to the sweep of the storm, "if

thou art merciful as she believes, help me to save him — for her!”

Then he dismounted, and leading his horse walked slowly forward, bending over the snow at every step, and calling Peyton's name.

“Fleming!” The voice was faint, but it was near, and in another instant he was kneeling beside his comrade.

“My horse fell on my leg,” Peyton murmured. “He is off across the prairie. My poor Evelyn!”

“Can you help yourself at all? — or shall I lift you on my horse?” said Fleming.

“What will become of you if I take your horse?”

“I shall lead him.”

There was a moment's silence. It cost so happy a man as Jack Peyton a moment's struggle to give up his last hope of life, even though he knew that Fleming was offering it to him at the risk of his own.

“Thank you, Fleming,” he said presently, feeling for the other's hand in the darkness and clasping it. “You are a noble fellow, and I beg your pardon for many things. But to take your horse would only be your death as well as mine. Leave me and go on. They say it is an easy death, and I dare say it will be over quickly. Tell my poor darling I ——” His voice died away, and his head sank against Fleming's shoulder.

The passionate resolve which had come to Fleming in the moment of his wild prayer did not falter even then. Peyton's voice calling his name had seemed to him God's answer to his appeal, and with the conviction that he should succeed he worked over the insensible man, until with brandy and rubbing he brought him back to consciousness, in spite of the cold and the wind and the darkness with which he felt he was fighting inch by inch for Jack's life.

With an effort of which only his excitement made him capable, he lifted Peyton to the saddle, and supporting him with one hand, while with the other he led the patient horse, which long years of habit had made obedient to his lightest touch or tone, they started again. On and on they went, through what seemed to Peyton an eternity of pain, cold, and tumultuous darkness. Again and again he sank away into partial insensibility, only to be roused by Fleming's hand pressing the brandy-flask to his cold lips, and Fleming's voice sharp and strained, but instinct with resolute courage, bidding him keep his hold on life for her sake who loved him. He may live to be very old, he may endure all that life holds of sweetest or bitterest, but neither time nor joy nor sorrow will dim the memory of the man whom he felt rather than saw walking beside him through those terrible hours.

As for Fleming, his purpose filled all his thoughts. He should save Peyton's life, and so make some atonement for that other comrade's life lost by his fault, and he should preserve for the woman he loved the happiness so nearly lost. Every faculty, every nerve was strained to the utmost, as he pressed on through a cold that benumbed him, in the face of a wind that made every breath an effort. The brandy which kept Jack alive he dared not touch, for fear that, half frozen as he was, the liquor might bewilder him, so that he should forget the number of paces which he calculated must bring them from one telegraph pole to another. When, because of some swerving from the direct line forward, the paces failed to bring them to the next pole, they retraced their fast-filling tracks to the last, and started again with desperate patience.

So through the rush and surge of the blizzard they struggled — the wearied horse, the half-conscious rider, and the strong, patient soul who kept, by his mighty purpose, exhausted body and overstrained nerves from sinking — until close at hand the lights of Fort Barton flashed upon his dizzy eyes.

It was between seven and eight o'clock that the garrison was aroused from its comfortable firesides by the report of the arrival of the two lieutenants and of their half-frozen condition. It was nearly two hours later that Evelyn Blake left Jack Peyton asleep after the setting of his leg, her heart full of deep thankfulness for the surgeon's assurance that his escape without serious harm from such a storm was almost miraculous, and that all he needed was rest and good nursing. There was deep thankfulness in her heart, but the keen ache of regret and pain too, for the surgeon had also told her that all efforts to restore Fleming from the stupor into which he sank immediately after his arrival had failed, and that he was paralyzed and dying. Jack had managed, weak as he was, to tell something of that four hours' march through the blizzard, and they knew at last how strong and unselfish a heart it was that cold and exhaustion were stilling forever. Very softly Evelyn entered the hospital room where they had carried Fleming. Colonel Blake and the surgeon were standing beside the bed, and her father put his arm about her as she came close to him.

“You understood him, my dear,” he said tremulously. “You are the only one of us who does not need to beg his pardon for the harsh judgment of these last three years!”

As if these words possessed a power beyond all the surgeon's restoratives, there was a quiver of the white face they were watching, and the dark eyes opened suddenly. A look of utter content came into them as he saw Evelyn.

"He is quite safe?" he murmured.

"God bless you for it!" she cried with a rush of tears. "But oh, my dear friend! you ——"

"What is the matter with me? — I cannot move," turning his gaze from her to her father.

"You saved his life at the cost of your own, my brave boy," the Colonel said gently.

"*Brave?* You say that?" A faint, faint color, even in the grasp of death, came into his pale face at this word from the gallant old chief, whose hardly concealed contempt had been so heavy a part of his burden of shame.

"We have been very hard upon you, Fleming, — all of us!" began the Colonel falteringly.

"Thank you," moving his hand feebly to the Colonel's grasp. "Tell my father the best you can of me!" His voice faltered in a gasp for breath, and the Colonel, raising him, laid his head on Evelyn's shoulder.

Presently Fleming opened his eyes again, and looked up into the tender face bent over him.

"You have been God's own angel of mercy to me!" he murmured, "and I — Jack will not mind if I say before I go — I love you!"

Nellie Mackubin.

AN "AMERICAN BEAUTY."

I.

UPON a summer afternoon there is no more charming place in London than the garden of Beech Lodge.

The house, built in the Italian Gothic style, is large enough for stateliness, small enough for coziness, and stands in an inclosure of several acres. There is a huge copper-beech tree on the lawn, and beneath its sheltering canopy one day in May sat a group of Sunday loungers with a tea-table for their center.

The sky was soft and dappled with clouds, and a faint breeze stirred in the syringa bushes. The brilliant green of the turf was sprinkled with a snow of daisies. The unspeakable charm of an English spring was upon everything — not the spring which is one day winter and the next summer, but the gradual dawning of loveliness that can almost be seen to creep on to perfection.

The group around the table consisted of a young man, an elderly ecclesiastic, and a gray-haired lady who presided at the tea-urn. The first was like a hundred other young men to be seen any fine morning in Piccadilly or the Row. He had the used-up, weary air of the well-bred man of fashion, and sported the badge of the order — a fine gardenia — in the buttonhole of his correct coat. There was a certain delicacy about his face and figure which gave one the impression that his languor might be as much real as assumed. He had a more thoughtful face than is commonly seen amongst the young Englishmen of to-day, and his really handsome eyes had a dreamy expression which implied that he had ideas beyond hunting, coaching, betting, and encouraging the style of drama then in vogue — burlesque.

The gentleman in the clerical waistcoat was

a Canon of the Church of England, far from monastic in appearance; a man who appreciated and put in practice when he could the obscure sayings in regard to making friends of the Mammon of unrighteousness.

The lady, who was the mistress of the house, was a spare, wiry person dressed in black, with a not unkindly face, and eyes which looked as if they had once been blue but had gone too often to the wash.

"Sugar and cream, Lord Bayswater?" she said as she suspended the tongs over the sugar-basin, and looked inquiringly at the young Earl.

"Thanks, yes," he said with great deliberation, like one who never feels time to be pressing except when it waits to be killed.

"Tell us more of your beautiful friend, Mrs. Lindesay," said the Canon, stretching out his hand for his tea. "As a patron of art, and the encourager of all that is beautiful, I am anxious to see Miss Raynham."

"I am surprised," replied the hostess, "that you have not met her before. She has been over here for a year or more, and has had every one at her feet — except you and Lord Bayswater."

"A very insignificant oversight, as far as I am concerned," said Canon Dalton, laughing in his jolly way. "As to Lord Bayswater, that may be a conquest yet to be made." The Earl smiled wearily, but said nothing. He wasted time and money, but never words.

"You will both see her to-morrow night. She and her mother dine with us. Shall we waive precedence, and send her out with you?" Mrs. Lindesay turned to the young man as she spoke.

"Really, Mrs. Lindesay, I would much rather be beside you," he said graciously, as he stirred his tea.

"I value that compliment less than I should if you had seen her," laughed Mrs.

Lindesay. "As for me, I am longing to know just what she is in America; whether all the girls are as pretty as she is, what her social status is, and so on. She appears to be well-bred — more so than her mother; but that is the way in new countries. The parents give advantages to the children in which they cannot participate."

"Who launched her?" asked the Canon, as though Miss Raynham were a new man-of-war; and perhaps there was reason for the metaphor, since the young lady had carried devastation into so many ports, sparing neither youth nor age.

"She knew but one family abroad. They were in the south of France. A certain Great Personage happened to be recruiting on the Riviera, and saw Miss Raynham. With his usual discrimination he saw that she was a beauty, and with unfailing appreciation of the beautiful —"

"As it manifests itself in the softer sex," interpolated the Canon. "An amiable weakness."

"Hush! I am telling you all about it. This Great Personage managed to get an introduction, and since then of course Miss Raynham is the fashion. One doesn't ask who these pretty Americans' fathers were. It's enough to see what the girls themselves are. Now the milliners have got out a new bonnet called the 'Jessie'; the photographers exhibit but dare not sell her pictures; and all London is mad about her. Worth has offered to dress her for next to nothing for a year."

"Not *in* next to nothing, as he does some of his customers," said the Canon with a twinkling eye.

"I am ashamed of you, Canon," said Mrs. Lindesay, with mock severity. "You forget your age and your cloth."

"I fear you are right, my dear friend," said the Canon. "The first I won't acknowledge, and the second I have to be reminded of."

He rose as he spoke, and put down his cup.

"To-morrow at eight. You will remember that, I'm sure," said his hostess.

"You may trust me." And with an urbane wave of the hand the portly Canon left the garden, and hailed an approaching hansom.

"A curious man that," said Bayswater presently.

"Always with three or four hobbies in the stable," said Mrs. Lindesay. "Now he is translating 'Mother Goose' into all the dialects of India. He thinks it a pity that the little Indians should have nothing to amuse them. A good many people have already subscribed to the enterprise."

II.

THE drawing-room of Beech Lodge was softly illuminated by the light of wax candles and two or three lamps judiciously distributed. Several men in irreproachable evening dress, all more or less hungry or bored, stood about the room. One absently turned over some photographs lying near him; another, with a monocle in his eye, watched each newcomer, his vacant and necessarily glassy stare expressing neither present pleasure nor anticipation; and a third stood before the fireplace, cold and dark as it was, with his hands behind him, surveying the company somewhat blankly. This last was Lord Bayswater, whose usual air of weariness was not removed even by the prospect of seeing the American beauty.

The ornamental sex was represented by Mrs. Lindesay, an olive-hued Indian princess, and her equally olive-hued mamma (who, it may be remarked in passing, had on her husband's demise escaped performing the suttee by flying the country and espousing an English captain). There was also the French ambassadress, who was conversing suavely in her own language with her hostess, ignoring with the politeness of her nation her frequent grammatical errors and her frightful pronunciation.

The star of the evening had not yet arisen with its attendant satellite. In other words, Miss Jessie Raynham and her mamma had not yet arrived. The hands of the clock pointed to half-past eight; the man with the monocle had a sense of vacuity which manifested itself in his face. The cook no doubt was in a tantrum, and the fish was spoiling, when, lo! the door opened, and the footman announced, with a solemnity befitting the occasion:

"Mrs. and Miss Raynham!"

There was a pause, a silence. Then, amidst the gentle rustling of soft robes, a radiant creature floated through the doorway.

She was almost ethereal in form; or, as her detractors would have said, she was extremely thin. Whatever beauty of figure she possessed was evidently due less to the beneficence of nature than to the ability of her Parisian staymaker. Her arms and shoulders were bare and showed that they were unworthy of her face, which was lovely. Her hair was blonde and fleecy with the faintest touch of gold in it, drawn upward from the nape of the neck, its undulations kept in check by the skill of the hair-dresser, until they broke out higher up into myriad little curls. Her skin was of the most delicate texture, her cheeks the pinkest, her brow and chin the whitest, and her lips the reddest, that can be conceived of in a human face.

Her eyes were dark brown, as were her

brows and lashes ; and perhaps to that lucky accident she owed the striking quality of her beauty. It was a charmingly tinted face, but, alas, it was the face of a lovely wax doll !

Mrs. Raynham bore no more resemblance to her airy daughter than a little bustling steam-tug does to a yacht under full sail. She had an elaborately frizzed black fringe, small twinkling eyes, and a manner which tried not to be eager and pushing. She was a goose that had laid a golden egg, and had not yet done cackling.

With a waft of perfume from the stephanotis flowers at her breast, Jessie Raynham approached Mrs. Lindesay, and said :

"So sorry to be late, my dear Mrs. Lindesay. You must not be angry with us."

Her voice was deep and carefully modulated. One felt in hearing it, however, that it had not always been so sedulously kept within bounds.

Mrs. Lindesay good-naturedly granted absolute for her guests' tardiness, and, contrary to English usage, introduced liberally.

Dinner was immediately announced.

Lord Bayswater took out his hostess, and on the other side of him sat Miss Raynham. With the taciturnity of a hungry Englishman, he ate his soup in silence. Miss Raynham was talking to the monocled young man, who was replying in discreet monosyllables which did not interfere with the gastronomic duties of the occasion. Lord Bayswater, however, noted the deportment of the young lady. He thought her self-conscious. She seemed to have a constant eye to her dress and its adornments. She often adjusted the pearls which she wore round her throat, and gave a settling touch to the stephanotis flowers at her breast. Her conversation was not particularly entertaining. The gayety of London, the heat of the weather, the unusual want of rain, the latest wedding — these and kindred topics engrossed her attention exclusively. "I want you to talk to Miss Raynham," presently whispered Mrs. Lindesay to Lord Bayswater. By this time he had eaten and drunk enough to be in a more cheerful and benevolent mood than that in which he had sat down.

There was a lull in the conversation between Miss Raynham and her next neighbor, and he broke in somewhat abruptly :

"I have a great desire to see your country, Miss Raynham."

The young girl turned slightly and looked him in the face.

"Have you, really?" she said. "I don't think it would interest you."

"Why not? Is it uninteresting?"

"It would be to you."

"You must have second sight, Miss Rayn-

ham, to know so well what I should like or dislike," said Lord Bayswater, a little annoyed.

"I only speak on general principles," said the American girl with a slight smile. "All Englishmen who visit us only go home hugging themselves to think how much better England is in every way."

"You have discovered our insularity already, I see."

"You see I have been here more than a year."

"You are a very shrewd observer, Miss Raynham."

"It took neither all my time nor all my shrewdness to make that discovery."

"And what do you think? Ought not we to love England?"

"Certainly. I love it myself."

"Better than America?"

"Ah, that I won't say. My father lives in America."

"How does he like your leaving him like this?"

"Oh, he endures it. American fathers are very accommodating."

"They must be! I think in that the Americans excel us. I am quite sure I should not be so accommodating."

Just then Mrs. Lindesay gave the signal to rise, and Miss Raynham and Lord Bayswater were parted.

After the men went into the drawing-room to tea the time passed quickly, and all too soon the evening was over.

III.

It was a curious fact, and one which few perhaps could have believed, that though Jessie Raynham had been abroad for over a year she had not received one offer of marriage. She had been presented the previous May, had attended several state balls and concerts since, and constantly appeared in public with the "smartest" people in London; and on all these occasions she had been distinguished by marked attentions from the Great Personage who had brought her into notice.

The tongue of Rumor had not been silent. Like all successful persons, Jessie had her detractors; but they were principally, let us hope, the disappointed ladies who saw their own daughters passed by, by those who were eager to do homage to the lovely American.

Nobody could say with truth that he or she had ever seen Miss Raynham do an unladylike action or heard her say an ill-bred thing. She was not clever enough to make personal enemies, and the head and front of her offending was that she, an alien, the daughter of a Yankee nobody, had held her own in London

society when many a blue-blooded damsel had utterly failed.

But after all her triumphs — her name a household word, her photographs clamored for but unobtainable, her dresses eagerly copied, and new styles named for her — after all this she was Jessie Raynham still, and was likely to remain so. The delicious day-dreams in which her mother had indulged at the outset of her career had almost ceased their rosy allurements. She had dreamed of "My daughter the Countess — the Marchioness"; nay, even, perhaps — why not? — "the Duchess!"

Mr. Raynham, a naturalized American who had made a fortune in petroleum, grumbled a little at the prolonged absence of his wife and daughter. But judicious letters containing descriptions of Jessie's good fortune, copies of the "Palace Gazette" with the name of Miss Raynham duly underscored, soothed his ire and stimulated his parental pride, and every fresh triumph elicited a fresh remittance.

(It is perhaps unnecessary to remark that it was not Mr. Raynham who audited the bills sent on account of the "Palace Gazette" puffs.)

To Jessie the days of Petrolia were as if they had never been. The days of ill-draped overskirts, doubtful stays, and uncertain hair-dressing; the days when she had, as she thought, given her heart — and well nigh her hand — to a bank clerk who piqued himself on dressing in the English style, and wore a white satin tie in the evening.

Since then many aristocrats had hovered about the American girl. Some had approached the brink of declaration, but always a politely opposed mamma had glided between the young man and the object of his admiration, and the affair had come to nothing.

Too often Jessie had been invited to St. George's, Hanover Square, shortly after, to witness the marriage of this victim of parental authority with a girl who might indeed be plain, but who could boast a shield with sixteen quarterings.

Mrs. Raynham's meeting with the Earl of Bayswater had given a fillip to her now somewhat weary ambition. The gentle interest thus excited became positive hope when in the course of a month or two, during which Jessie and the young nobleman had met several times, came an invitation from his widowed sister, Lady Mildred Rae, to spend a few days at her house in Hertfordshire.

Lord Bayswater's estate lay but a few miles distant from his sister's, as Mrs. Raynham knew very well; and as the Raynhams' acquaintance with Lady Mildred was of the slightest, it looked very much as if Bayswater had planned the visit.

IV.

THE beauty was gentle, quiet, and self-contained as ever. The exquisite pink of her cheek, the soft coral of her lip, never fluctuated; and her interest in acquiring fresh toilettes for the visit outran that which her mother took in reconstructing all the air-castles which had lately got so sadly out of repair.

Mrs. Raynham could not tell, and dared not inquire, whether the young Earl had taken captive her daughter's fancy. Gowns, bonnets, parasols, and all the paraphernalia of a lady's toilette, engrossed all the fair American's attention.

When Mrs. and Miss Raynham and their maid started for Hertfordshire, one heavenly afternoon towards the close of June, the luggage which they took with them was appalling by reason of its size and quantity. But then, when one has to dress four times a day for seven days, in order to keep up one's reputation, one cannot expect to travel with a portemanteau.

Lady Mildred had foreseen the demands of the numerous dress-baskets, and had sent her private 'bus to the station, which drove to the house with a pile of boxes on top and the maid inside. On the platform stood Bayswater and his sister. He evinced some pleasure at seeing Miss Raynham and her mother. Lady Mildred, fresh, good-looking, and five-and-thirty, scrutinized her younger guest by the merciless light of the sun, and inwardly remarked that she would make a not unrepresentable sister-in-law.

"So good of you to be willing to lose a whole week of the season for my sake!" she said, as they drove away in a carriage drawn by high-stepping grays. "The country air will do you a world of good, though, Miss Raynham. It is simply awful, the way girls go out now, all day and all night. I'm sure I should be a perfect wreck."

"Oh, Jessie's used to it," said Mrs. Raynham complacently, settling her bonnet-strings. "I don't suppose there is once all summer that she gets to bed before morning. The Prince says he's surprised to see how she keeps her freshness. It is no wonder to me that so many London ladies paint now."

Bayswater winced a little. The poor lady's accent was not of the purest, and her speech sounded rather boastful; and yet what free-born American would not be the least bit elated under the circumstances? Don't we all take kindly to the "effete monarchies," if the "effete monarchies" only take kindly to us?

The house was soon reached — a house built of brick with many curious gables, mantled with luxuriant ivy. There were umbrageous trees, and smooth-shaven lawns, and a flash-

ing fountain; there were parterres of flowers, and snow-white pigeons circling about in the warm air, or settling on the edge of the fountain. And over all the well-kept grounds, the rolling wooded country, the silver winding thread of river, where Izaak Walton fished so many years ago — over all fell the radiance of the low afternoon sun.

A long course of English country-house visiting had accustomed the Raynhams to the beauty and luxury enjoyed by the favored upper classes. It was but a sorry preparation for going home, if they ever intended to do so — a green apple after ripe peaches.

They had, however, no thought of going home. They installed themselves comfortably at Lea House.

Lord Bayswater's solicitor was spending a day or two in the house. He was a valued friend of the family, who had known them all from their childhood and their parents before them. His iron-gray hair thatched a head well packed with professional secrets. He was a man who believed, from actual experience, that truth is stranger than fiction. It seemed to Jessie that Mr. Marsham paid particular attention to what she said. He appeared to take a deep interest in America in general, and Petrolia in particular.

At dinner he generally asked her some searching question, the answer to which would have disclosed something in regard to her social status and antecedents; but he did it with so much delicacy, and such a charming smile on his old face, that she could not resent it.

It was understood that he was combining business with pleasure in making Lea House his home for a short time. The late Earl of Bayswater had died but a year before, and Mr. Marsham seemed to have a good deal of business on hand still in settling the affairs of the deceased. The present Earl, who spent most of his time at his sister's house, only sleeping at Riverton Hall, his own place, was often closeted with the old solicitor.

There were one or two other young girls and men staying with Lady Mildred. The weather was favorable to outdoor sports, and a good deal of tennis was played. Miss Raynham never did anything so violent and unbecoming. She arrayed herself in a sort of sublimated tennis costume (in which no earthly woman could move about quickly without finding herself terribly handicapped), and sat in a Market Harborough chair on the lawn watching the others.

Every day after luncheon she retired, presumably for a beauty-sleep and a fresh crimping of hair, and emerged at five o'clock in an exquisite tea-gown. Another elaborate toilette was made before dinner.

"She is a delicious bit of millinery," said Lady Mildred one day to Mr. Marsham; "but I don't think Bayswater can afford to marry her."

"You are right!" said the old gentleman; "and," he added with an oracular nod, and the ghost of a wink, "he will not."

"I wish I felt as sure!" said Lady Mildred.

"You would if you were I," returned Mr. Marsham. "Poor Bayswater! He thinks he will, but he won't."

It certainly appeared to the people at Lea House as if the Earl's affections were becoming engaged. He showed a wonderful degree of interest for him. Miss Raynham was as cool and imperturbable as he was himself; and perhaps that added zest to the courtship, if courtship it was. It was arranged one afternoon that Lord Bayswater should drive the party over to Riverton Hall on his drag. Mrs. Raynham, being the only married lady except her hostess, occupied the box-seat.

The sky was softly overcast. The four fine bays bowled the coach along over the smooth roads as if it had been but a feather's weight. The old solicitor began once more to speak of America and the Raynham family.

"You said, I think, that your father is English, Miss Raynham," he said.

"Yes," said Miss Raynham shortly, pulling her morsel of veil down over her nose.

"How long has he lived in America?"

"Between thirty and forty years, I believe."

"So long, I suppose, that he has almost forgotten his old home."

"He seldom speaks of it."

"In what county was he born, Miss Raynham?"

"Really I don't know, Mr. Marsham. You seem to honor our family with your interest."

"I do, my dear young lady," said the old man, unabashed by the girl's coldness. "Is it any wonder that I wish to know what stem bore so fair a flower?"

Miss Raynham pulled up her long Swedish gloves, and appeared somewhat mollified. They were nearing Riverton Hall. Near its gate they passed an inn, picturesque and ivy-mantled, like most English inns. It was called the Bayswater Arms.

"Did your father ever speak of that inn to you, Miss Raynham?" asked the old solicitor. "I think you said that he was brought up near here?"

"Mr. Marsham, you evidently don't believe that I know nothing whatever about my father's early life," said Jessie, this time laughing outright at the old gentleman's persistency. "I can write and ask him for his biography, though, if you like."

"No, no," said Marsham, with a gentle chuckle; "that would be unnecessary."

The coach drove in through the tall gates, with the Bayswater coat-of-arms cut in stone above them, and rolled briskly up the long avenue of wide-reaching beeches.

The fern grew high all along the road, and from time to time the white tufted tail on a vanishing rabbit flashed in the dim light which sifted through the green above.

It was a noble park, and there were several miles of drive leading up to the Hall. The house itself was not specially imposing, except by reason of its size. It was almost square, and unadorned except for the masses of creepers which nearly covered the gray cement walls. The grounds about the house were in exquisite order; and on the lawn, under a gayly striped marquee, stood a tea-table bountifully spread with many delicacies, including hot-house peaches.

"I vote for tea first, and walking afterward," said Lady Mildred, candid enough to confess that she had a healthy appetite.

So every one seated him or herself, and did ample justice to the meal.

After the party had partaken of the refreshments, they dispersed, some to go through the house, some to explore the grounds.

Somehow Lord Bayswater and Miss Raynham were left alone for a few moments.

He came quite close to her, and said in a low voice, which had lost some of its usual languor, "It is a fine old place, but so lonely!"

Jessie threw a bit of cake to the peacock which was strutting on the lawn, glowing in the light of the sun which had burst through the clouds.

"You have neighbors," she said.

"None that I care for except my sister."

"You are not here much, I imagine."

"No, but I should be if the house were brighter and more cheerful."

"Plenty of people will come to you when you ask them."

He looked at her with a slight eagerness in his manner.

"I know that," he said; "but I care nothing for people. What I want is some one who will watch my goings with sadness and welcome my home-comings with joy. Do you think there could be such a person, Miss Raynham?"

For the first time since he had known her, she turned pale.

"There might be," she said gently.

With an Englishman's inability to be eloquent when he feels most, for a moment Bayswater was silent. In that moment Fate, in the person of Mr. Marsham, stepped between

them. He had come upon them unexpectedly through the trees. Jessie stood in her light gown and coquettish hat, with the sunbeams through the boughs glinting on her blonde hair and exquisite peach-bloom face. She held her parasol lightly resting across her arms, and her eyes were bent upon it. The Earl was near, very near her, and his eyes were full of a sentiment hitherto a stranger to them. All that was at once manly and tender in his disposition glowed in his face.

"It is a shame," murmured the old man, "but I must do it." And so he stepped between them.

"You are wanted in the house, Miss Raynham," he said. There was a deprecating look on his hard old features. Fifty years of law had not made him entirely brutal. Bayswater gave a great start.

"Miss Raynham is also wanted here," he said haughtily; but just then Lady Mildred appeared in the doorway of the house, and beckoned to them.

"The others are in the picture-gallery, Bayswater, and we want you to tell us about the portraits," she called out. Unwillingly the young man approached to do her bidding, and in some way — they never knew how — he and Jessie were separated for the rest of the evening.

V.

THAT night when Lady Mildred's guests had retired, and Bayswater was preparing to return home (for he had driven the party back, and dined with his sister), Mr. Marsham accosted him.

"What, you up still?" asked the Earl with some coldness.

"I cannot rest till I have seen your lordship alone," said the old man.

"I am just going home," said Bayswater.

"There is something important to communicate to you, Lord Bayswater. The sooner I do so the better."

Something in the gravity of his expression arrested the attention of the young man. He turned into the library, where a shaded lamp still burned, and threw himself into a deep chair. Mr. Marsham also seated himself.

"I have only a few moments to spare," said the Earl, "and the dog-cart is at the door."

Mr. Marsham moved his hands about rather nervously, and took a letter from his pocket. He cleared his throat, and then, with a look of dogged determination, said: "Your lordship is aware that your late father's affairs are entirely settled with the exception of one bequest."

Bayswater nodded. He was thinking more of marriage settlements than bequests. "You know that the late Earl left legacies to all

his servants, even to some who had left his service many years ago."

"I know all that," said Bayswater impatiently.

"There was one servant who could not be found. He was but a lad when your father succeeded to the title. He was a good servant though, and the Earl was attached to him. He was the son of the man who kept the Bayswater Arms. When he was about sixteen he was groom in the Riverton stables. He always rode behind your father; but one day he was accused of theft — wrongfully accused, as it turned out afterward. However, he disappeared under a cloud in America, as it was thought. The late Earl, when he discovered that the boy was innocent, vowed that he would make provision for him in his will, and he did.

"For almost a year, my lord, I have corresponded with a lawyer in the States in regard to the man; and now we have found him. I have here a letter telling me where he lives, and how he can be communicated with."

Mr. Marsham paused and wiped his forehead. Bayswater smothered a yawn, and leaned back in his chair.

"All this would have kept till to-morrow, wouldn't it, Marsham?" he said with a somewhat weary smile. "Who is your man? The cart is waiting, you know."

The solicitor half rose. The letter was trembling in his hand.

"His name is James Raynham."

"Raynham! — James Raynham!" exclaimed the young man with a vague look. Then — "Good Heavens! You don't mean — hang it all, what *do* you mean?"

He started up now, grown very white.

"O my dear lord! My dear Bayswater!" faltered the old man. "Is it so bad as this? You *do* care! I feared so; but my duty, dear boy, my duty!"

He tried to lay his hand on the Earl's shoulder, but the young man swerved aside.

"Who is this cursed James Raynham?" he cried. "You haven't yet told me."

"Her father," said the old man sadly. "*Her* father — *your* father's groom!"

Bayswater winced as though he had been struck. He turned and walked over to the mantelpiece, and leaned his head down upon it.

"I dared not wait to tell you," said Marsham. "These things are hard — devilish hard."

There was a deep silence in the room. Outside the impatient horse was champing his bit. It was after midnight. Suddenly Bayswater looked up.

"*She* cannot help it," he said defiantly.

"Marsham, I am fond of Miss Raynham. I — meant to — marry her."

"So I feared, my lord."

"Why shouldn't I? She knows nothing. I won't believe she knew it all the time. Why should I not marry her?"

"Because," said Mr. Marsham gravely, "because you owe it to unborn generations to keep the blood of the Rivertons pure. You would blush to have your father's groom the grandfather of your children."

Bayswater once more turned away, and for a few moments again all was still. Then he faced Marsham with a look of mingled pain and courage.

"By Jove! you're right," he said huskily. Then, as though speaking to himself, "That settles it."

"You won't repent it," said the solicitor. "Here is the lawyer's letter." Bayswater grasped the paper, and passed out into the night.

Flinging himself into the dog-cart, he drove away as though all the furies were after him.

VI.

THAT night was a long and wakeful one to somebody besides the Earl. Jessie Raynham tossed on her luxurious bed, staring into the dark, or closing her eyes, while she recalled every event of the day before. At last, when the early summer dawn had diluted the blackness with enough light to make it only grayness, and the little birds, like sun-worshippers as they are, began to twitter and chirp their prayers to the rising god of day, Jessie managed to fall asleep.

She slept until all nature had been wide awake for some hours — till her maid roused her with her morning cup of tea.

When the young girl descended to the breakfast-room there was a weary paleness on her face, which told its own story.

The doll had a heart.

While the party sat at breakfast there was a clattering of hoofs on the gravel, and one of the Riverton grooms rode up. (Perhaps five-and-thirty years ago, James Raynham had often ridden up in the same way.) The groom brought a note for Lady Mildred. With a hasty excuse she broke the seal and read:

"DEAR MILDRED: Last night I received some important information which has entirely altered my plans. I must go up to London this morning. From there I go to meet the *Rondinella* at Hull, and start for a long cruise in Norway. Kind regards to your guests.

"Your affectionate brother,

"BAYSWATER."

"Riverton Hall."

At that time there was an old man in Petrolia, U. S. A., chuckling at the thought of his wife and daughter hobnobbing with the son of his late master.

Lady Mildred was embarrassed, and showed that she was. "Most unaccountable," she said, changing color. "Bayswater has gone up to town *en route* for Norway."

Mr. Marsham's head sank in a shame-faced way. He was trying not to see Miss Raynham. She raised her eyes with an expression in them that Lady Mildred never forgot. It was a passing flash of surprise, insulted pride, and — unmistakable pain.

"Rather early for Norway," hazarded one of the party around the breakfast-table.

"In time for the midnight sun, though," said another.

"What jolly bear-skins he'll bring back," said a third.

To them the Earl was but a languid, taciturn young man whom they would not miss.

After breakfast Mr. Marsham acquainted

Lady Mildred with the reasons for her brother's behavior. But Jessie Raynham never knew.

Mrs. Raynham locked her door and stamped. A year of country-houses and foreign polish had not deprived the good lady of a free-born American's privilege of railing at the British aristocracy when she pleased.

Lady Mildred was very kind, but the last day passed heavily. The Raynham went back to London. Royalty still patronized them, and Jessie was still beautiful — even more fragile in her loveliness than before her visit to Hertfordshire.

Yes, the doll had a heart; its cheek paled and it lost its interest in gowns and bonnets for a time.

A few months after this, one of the American papers, with a truly journalistic disregard of the Golden Rule, contained the following paragraph:

"Miss Raynham, the American beauty, who has held her own for more than a year in London society, is said to be losing ground."

Edith Evelyn Bigelow.

SUNRISE.

FLAME-HEARTED lover of the Earth — great Sun!
 Rise from thy purple couch; Stretch forth thine arms
 Through morning's parted curtains; Let the charms
 Of waiting love — which it were death to shun —
 Persuade thy clasp. Now hath the Earth begun
 To loose her robes of mist; with mock alarms
 She yields her beauty, which love's longing warms,
 Forestalling the embrace thy kiss hath won.

Arise, great god of light and life, Arise,
 Enfold the fond Earth in the deathless glowing
 Of thy fierce love; Bend from the shimmering skies
 Which burn before thee in thine onward going.
 No cheer have we and not of thy bestowing:
 Thou art the joy of all hope-lifted eyes.

SUNSET.

WITHIN thy burning palace in the West
 Thou art awhile withdrawn. Yet doth thy face
 Look from the closing portal for a space
 Back to the Earth, which thy dear love hath blessed;
 While she with tears and soft sighs half-repressed
 Beholds thee sinking in thy resting-place,
 As with up-gathered folds of dewy lace
 She hugs remembrance to her yearning breast.

Thy glory darkens, and the careful night
 Hangs out the moon's pale lamp while yet the flush
 On Evening's face — with thy departing light —
 Turns from rose-pink to crimson, till the blush
 Dies with the coming stars, and slumber's hush
 Wraps thy warm bride, who waits thy waking Might.

Robert Burns Wilson.

THE HUNDREDTH MAN.*

BY FRANK R. STOCKTON,

Author of "Rudder Grange," "The Lady, or the Tiger?" "The Late Mrs. Null,"
"The Casting Away of Mrs. Lecks and Mrs. Aleshine," etc.

IV.

ON the day after Gay Armatt's birthday Mr. Stratford went fishing near the foot of the mountains, and he brought back a very fair string of trout; but on the following day, which was

Thursday, he drove over to Mrs. Justin's place, and found the two ladies engaged in setting up a target on the lawn where they were going to practice archery. He received a warm welcome, for Mrs. Justin knew him as a good bowman, and he speedily took the arrangement of the target and the stringing of the bows into his own hands.

It was not long before he found that the course of studies at Miss Armatt's college had not included archery, and that, although she had a good eye and a strong arm, she knew but little of the use of the bow and arrow. Mrs. Justin was an excellent archer and needed no assistance, and although Stratford took his shots when his turn came, he gave the most of his time to the tuition of Miss Armatt. He informed her—and in a manner which seemed as if he were telling her something she had once known and now forgotten—how she must stand, how she must throw back her shoulders and advance her left foot, how she must draw the feathered end of the arrow back to her little ear, how she must set her eye upon the target and her mind upon the arrow. Once he found it necessary to place her fingers properly around the string. But whatever he did, and whatever he told her, was done and said with such a courteous, almost deferential, manner, that the relation of teacher to pupil scarcely suggested itself. It seemed rather as if Gay and Mr. Stratford were partners in a match against Mrs. Justin, and that they were helping each other.

When he had gone, Gay Armatt expressed a high opinion of Mr. Stratford. He seemed to know so much, and was so kind, and gentle, and pleasant in his way of telling people how to do things. And to this remark Mrs. Justin answered that she knew of no one who was more of a gentleman at heart than Horace Stratford.

Whereupon Miss Gay had an idea, down at the bottom of her mind, about a certain relation that she thought would be very suitable indeed, and which gave her pleasure to think of. But nothing would have induced her to mention this idea to Mrs. Justin.

Mr. Stratford came no more to the Justin mansion until Sunday, when he staid to dinner, and spent the afternoon. Mr. Crisman was there, and he and Miss Armatt were very glad to see a visitor, for it was a rainy day, and there could be no strolling through the woods; but with some one to talk to Mrs. Justin in the library, there was no reason why the two younger people should not wander off into some other part of the house, and stay away as long as they pleased.

In the evening, however, they were all together, and Mr. Stratford, with that courtesy which was characteristic of him, yielded the floor, during the greater part of the time, to the younger man. Mrs. Justin expressed the hope that Mr. Crisman might arrange matters so that he could arrive earlier in the day when he returned on the following Saturday. In that case they could make up a croquet party of four for the afternoon. Croquet was a game of which Mrs. Justin was very fond, although it had gone out of fashion; but Mr. Crisman put his hands in his pockets and smiled. Then he stated, with an air of not unkindly superiority, that he had but a small opinion of croquet and archery; that is, considered as recreative occupations for adults.

"If there were enough people here and in the neighborhood to get up a base-ball match," he said, "that would be something worth considering, but I rather think my grass-billiard days are over. Then, there's another thing," said Mr. Crisman, turning suddenly towards Mrs. Justin; "I sha'n't be able to come here next Saturday, anyway, for some of my friends and myself have made up a party to go on a cruise on the Sound in a yacht. You see I want to get a little sea air when I have a chance, and I shall have plenty of the mountains when I come here to spend my vacation."

"You never said anything to me of not coming next Saturday," said Gay reproachfully.

"No," said Mr. Crisman, turning to her

with a smile; "I didn't want to plump it on you too soon."

Mr. Stratford now rose to go home, and Mrs. Justin went out on the piazza with him to see if there was any chance of a clear day for the morrow, thus giving Mr. Crisman an opportunity to soothe the injured feelings of Miss Gay.

The next day Stratford drove over to the railroad station, and brought back with him his friend Arthur Thorne, whom he had invited to the Bullripple farm for a week's fishing. Mr. Thorne was a very earnest worker at fishing; and indeed he always worked earnestly, whether in pursuit of pleasure or profit. On the day after his arrival he walked steadily in his wading-boots, and with his fishing accouterments, up the middle of a long trout stream. The water was very cold, and sometimes quite deep; but when Mr. Thorne did anything he did it in the right way, and he knew very well that the way to fish a trout stream was to wade up the middle of it against the current. His friend Stratford was not so thorough in his methods, and frequently did a great part of his day's fishing while standing on dry land; but for all that he generally caught all the trout that he and the Bullripple family could eat.

When, towards the close of the afternoon, the two friends returned to the farm-house, they found Mrs. People in a state of wild agitation. Stratford had scarcely set foot upon the porch when she took him to one side, and communicated to him the cause of her mental and physical commotion.

"I don't know how to begin to tell you, Mr. Stratford," she said, "but me an' Enoch has got to go to the city to-morrow mornin' the very earliest we can, which is by the milk train, which leaves the station at five o'clock. Enoch got a telegraph message from John just as we was settin' down to dinner to-day, an' he sent for both of us to come to him just as soon as ever we could, which we would have done this afternoon, gettin' there after dark, to be sure, but we wouldn't 'a' minded that in times like this if it hadn't been for you an' the other gentleman, who couldn't be left with nobody but Marier to cook for you an' take care of you, who isn't no more able even to set your table, let alone a-cookin' a beef-steak an' makin' coffee as you like it, than she is to go into the pulpit an' preach; an' so, of course, we had to stay until we could see what could be done to make you an' your friend comfortable while we was away, which won't be more than three or four days, judgin' from John's message, which was a good long one, though I thought that ten words was all anybody ever sent. An' I'm sure nothin'

could 'a' happened worse than havin' to go away at this time just in the very week that you have company."

"But what is the matter, Mrs. People?" said Mr. Stratford. "You haven't told me that. Has anything happened to your son?"

"Happened!" she exclaimed. "Why, I should say something had happened! Vatoldi's has been boycotted."

At this announcement Mr. Stratford manifested his surprise by laughing outright. "What utter absurdity!" he exclaimed. "And why in the world should you and your brother be called upon in an emergency of this sort?"

"John says," replied Mrs. People, "that he must instantly have somebody he can trust, an' we are the only ones. What he wants with us I don't know. But down we must go, an' no later than five o'clock to-morrow mornin' either. John knows very well that Enoch's hired man, Jim Neal, can do everything that's needed on the farm for two or three days, anyway; and I suppose he'd forgot about Marier not bein' able to cook for anybody but farm hands, an' they wouldn't stand her more 'n a week at the outside, an', of course, he didn't know your friend was here. But there's no use talkin' about all that. What's to be done now is for you two gentlemen to make up your minds what you're goin' to do while we're gone."

"You need not trouble yourself about that," said Mr. Stratford, "if there is an urgent occasion for your leaving home; and I suppose there must be, though I don't understand it. Mr. Thorne and I will do very well while you are gone. We will consider that we are camping out, and what cooking Maria cannot do I can do myself. I'm a very good hand at that sort of thing."

"Not a bit of it! Not a bit of it!" exclaimed Mrs. People. "I couldn't rest easy for one minute on whatever kind of a bed John has to give me, for I'm sure I don't know what it's goin' to be, if I thought of you here doin' your own cookin', an' with Marier greasin' your way out of this world with her lard an' her ham-fat. No, indeed; it shall never be said of me that I went off an' left you in any such a mess as that. But here comes Mrs. Justin's man, Henderson, on horseback, an' by the looks of him he's bringin' a letter."

The man did bring a letter, and it was for Mr. Stratford, and in it Mrs. Justin gave him and his friend a very cordial and earnest invitation to stay at her house during the absence of Mrs. People and Mr. Bullripple.

"How did Mrs. Justin know anything about this?" exclaimed Stratford, when he had read the note.

"Why, you see the way of it was this," answered Mrs. People. "As soon as Enoch an' me got over the worst of our flurry, which was mostly mine, I must say, I began to think about you an' what was to become of you while we was gone. Then I says to myself: 'Mrs. Justin ought to know about this, not as I'd ask anythin' of her, for I'm just as independent as the next person; but still, if she wants to do anythin' in a neighborly way, it isn't for me, who ever sence she first come with her husband to live here never had one word to say ag'in' her, to put myself an' my independence in the way of her doin' it.' So I jus' had the buggy hitched up, an' I drove over to her house as hard as I could go; an' 'twould have done you good, Mr. Stratford, to see how that mare did trot when I worked her up to such a state of mind that she forgot to shy at them upturned tree-roots just at our line fence, which she's done reg'lar ever sence the tree was blowed down in September of year before last. An' I told Mrs. Justin all about the thing jus' as it really stood, an' she said I needn't trouble myself about you an' the other gentleman, for she'd invite you to stay till I got back. I made up my mind I wouldn't say nothin' about this till she sent over an' asked you, for it wasn't any of my business to interfere with her concerns, nor her way of attendin' to 'em; but I must say I felt a mighty relief when I saw that man Henderson comin' with a letter, which, of course, I knew he had an' what it was. An' now I'll be off and see about supper, or else Marier'll give you a taste of what you might have expected if you'd been left here with her to take care of you."

Stratford reflected some little time before answering Mrs. Justin's note, but then, after consulting with Thorne, and considering that the invitation was a very honest and kindly-intentioned one, which should not be declined without good reason, he determined to accept it.

In the early gray of the next morning Enoch and Mrs. People took the milk train for the city, and Stratford and Mr. Thorne drove over to Mrs. Justin's house in time for breakfast.

v.

THERE was, indeed, trouble at Vatoldi's, and John People found himself in a perplexed and soul-harrowed condition. The establishment over which he presided was such a well-ordered one that everybody seemed to be surprised at the sudden changes which had taken place in this favorite resort. The employees had always been well treated and well paid, and had never shown any dissatisfaction with the rules of the establishment. But recently

they had broken out in open rebellion against a fundamental regulation.

It was a cherished belief in the mind of Mr. Stull that a waiter should look like a waiter, and that his working-clothes should not be the same as those worn by gentlemen on ceremonious occasions. None of the waiters at Vatoldi's had ever made the slightest objection to their neat and appropriate costume. But a man had recently been engaged, George Bencher by name, whose soul soared above the restrictions imposed by narrow-minded authority. He made it plain to the other men that in all first-class restaurants the waiters wore dress-coats in the evening, and for him and his fellows to be attired in jackets and aprons at all hours was a visible proof that they worked in an establishment of a low order, or else did not possess the manhood with which to assert their rights. A united demand was therefore made on John People that the waiters should thereafter be allowed to wear dress-suits in the evening, instead of jackets and aprons.

John People, of course, was not empowered to make a decision in an important case like this, nor could he say that he would refer the matter to his superiors, for, in the ordinary management of the business, he was not supposed to have any. Everybody connected with the place knew that the original Vatoldi must now be dead, and that, if John had not bought out the place, he was conducting it for the heirs. Mr. Stull had always insisted that, while John must refer to him in matters of any importance whatever, he must, at the same time, take care that no one should imagine that he was obliged to refer to anybody. Mr. Stull was most anxious that no curiosity should be aroused, and no impertinent investigations set on foot, in regard to the ownership of Vatoldi's.

Consequently John was obliged to tell the men that he must take a little time to think over the matter, and when he went to the bank that afternoon to make his daily deposit and confer with Mr. Stull, he laid the affair before that gentleman. Mr. Stull was very indignant, and ordered John to tell the waiters that on no account would their absurd and impudent demand be complied with; so long as they served at Vatoldi's they should never wear dress-coats; and that, if they desired to adopt that style of dress, they must go somewhere else and do it. John gave the waiters his decision that evening, and when it was received every man took off his jacket and apron, put on his ordinary coat and his hat, and departed, and the establishment closed an hour or two earlier than usual.

But John was equal to the emergency, and before the busy hours began next day he had secured, from the list of applicants in his possession, enough waiters with whom to carry on the service. Now the war began, the offensive operations of which were directed by the energetic Bencher. Many of the newly employed waiters were frightened away, and threats of loss of reputation and ill-usage weakened the forces in the kitchen. More than this, Bencher determined to produce an impression upon the patrons of Vatoldi's, and, if possible, bring about a boycott of the place. The discontented waiters were called upon to contribute to a fund, and the money was employed in efforts to make the public believe that they should not patronize Vatoldi's. Men were hired to parade the sidewalk in front of the place, bearing banners on which were painted warning inscriptions. "Eat not at the house of the oppressor!" sounding like a text of Scripture, was expected to have much effect. Another inscription, based upon the belief in Vatoldi's decease, read thus:

"The Ghost's Restaurant
Kept By A Dead Man.
Cooking Done In The Vault."

These banner-bearers, however, with the crowds they attracted in the busy thoroughfare, were soon driven away by the police; but the generous distribution of hundreds of copies of a circular which Bencher had composed and had had printed was found to be of great service to the cause of the boycotters. This informed the public that if they patronized Vatoldi's they might expect that the conscienceless management would be just as ready to impose bad eggs and tallow butter upon its patrons as it was to lay its vile yokes upon the necks of its employees; with much more matter of a like character.

As the authorship of these circulars could be referred to nobody in particular, and as they might be scattered by any one as he passed the place, it was difficult to prevent their distribution. People would stop to look into Vatoldi's to see what was going on, and other people stopped to see what these were looking at. Under these circumstances very few ladies came to Vatoldi's; and although a good many men persisted in taking their meals there in spite of the inferior service, the ordinary luncheon or dinner preferred to go to some restaurant not so prominent in public notice, and the patronage of the place fell off greatly.

The heart of Mr. Stull was filled with indignation and energetic resolve. If he could have appeared in his proper person as proprietor and manager of the boycotted establishment,

he would have conducted affairs with such courage and wisdom as would have entitled him to the approbation of all good citizens. But it was simply impossible for him to make up his mind to avow himself the owner of Vatoldi's. His pride in the high position which he held in social and financial circles would never allow him to admit, even in such a crisis as this, that his fortune in any way depended upon his ability as a restaurant-keeper. Social standing was dearer to him even than money, and he would much have preferred to see Vatoldi's deserted by its patrons for a month, or even a year, than to see himself and his family deserted by "Society."

But he did not intend that Vatoldi's should be deserted. He could do nothing openly; but indirectly as a patron of the place, and as an earnest defender of the right of man to carry on a legitimate business in his own way, he did a great deal. He took all his meals at the place, and induced many of his friends to go there. He urged them to do this for the "principle of the thing," although he did not hesitate to say that he should be very sorry to see this establishment, the best of its kind in the city, come to grief. He took his wife and three daughters to Vatoldi's for lunch and also for dinner, and both his carriage and his coupé were kept standing as long as possible before the door.

When John People came to him at the usual hour, Mr. Stull fairly loaded him with injunctions and directions. If anything very important occurred, John was to telegraph to him at bank or residence, in a simple cipher, of which Mr. Stull had prepared two copies; and the faithful manager was ordered, whenever his employer went up to the desk to pay his bill, to give him, with his change, a brief report of the state of affairs up to that time. It was at this conference that it was agreed that Mr. Bullripple and Mrs. People should be sent for. It was quite obvious that in this emergency John must have some assistants in whom he could trust; and although his mother and his uncle knew nothing of restaurant-keeping, they were persons of varied abilities and much energy, and he felt that he knew no one else in whom he could place a like confidence. Mr. Stull was acquainted with the old farmer and his sister, and while they were not the people whom he would have decided to call upon, had he had a choice, he knew that they were honest and devoted to John; and those points decided him to authorize John to call upon them.

Mr. Bullripple and Mrs. People arrived at Vatoldi's about eleven o'clock on the second day of the boycott—an hour of the morning at which, even on ordinary occasions, there

were comparatively few customers in the place. John expected them by this train, and knowing that the meeting with his parent would not be an exhibition suitable for the public eye, he had retired at the proper moment to a small back room used as a storage pantry; and it was there that his mother infolded him in her arms, and assured him with streaming eyes that she would stand by him to the last bone in her body.

When the emotions of Mrs. People had been somewhat quieted, and Enoch Bullripple had taken his nephew by the hand and had inquired what was the trouble, and what John wanted him to do, they all sat down at a table in the corner of the large room, and everything was explained. Mrs. People was very anxious to know what Mr. Vatoldi thought about it all, but John evaded her questions.

"Everything is left to me," he said. "The proprietor is away and cannot come here, and I must manage the whole affair myself; and I think I can get through all right if you two will stay here for a few days until things come straight again."

"We'll stay, John," said his mother, "just as long as you need us. You may depend on that."

"That's so," added the old man. "We'll stick to you till the place is either shut up or running along as it used to. Now, do you want me to carve, or to wash dishes?"

It did not take long for John to explain what he wanted his new assistants to do. His mother was to go into the kitchen. The head cook had been induced to follow the waiters, and although the assistants who remained were moderately skilled in their duties, they could not be trusted to work without supervision. Mr. Bullripple was to keep a general eye upon the dining-room, and when John went out was to preside at the cashier's desk. He was not quick at making change, but he could do so with great accuracy, having a very sharp eye for a penny.

Enoch Bullripple had not always been a farmer. Although country-bred, he had at one time kept a small grocery store in the eastern part of the city, and after that he had made a voyage to the West Indies, during which his speculations in early cabbages and potatoes had proved very profitable to him. The head, arms, and legs of Mr. Bullripple were very hard, and his movements and his wits were quick. He was not ignorant of the ways of the town, and was one of those countrymen against whom town dealers are much more likely to endeavor to defend themselves than to try to impose upon them. He entered with much interest into the new line of business now open to him at Vatoldi's. He was very

willing to give his nephew all the assistance in his power, but he also had a strong desire to make use of the opportunities that might now be afforded him to find out what was that nephew's true position in the establishment. If Vatoldi were dead, as he had reason to believe, could it be possible that John was now the real proprietor? In that case, what became of the very large profits which must accrue from the business? But if John were merely acting as the agent of some one else, who was that some one else? This was the question to which Enoch gave his attention, for he did not believe that John was actually at the head of affairs. He was quite sure that there was a proprietor and general director in the background, and he was quite as sure that this person desired to remain very much in the background. It was not merely curiosity which prompted Enoch to discover the unknown owner and his motives for secrecy. He believed that his nephew was carrying a very heavy load with but very little profit to himself, and that if he, Enoch, could get one of his strong thumbs into the Vatoldi pie, he would be able to pull out a plum for John.

Mr. Bullripple walked up and down between the rows of tables in the long room, sometimes taking his seat on an empty chair, of which, on this day, there were a good many. He kept his eyes on the new waiters who had been employed, looking sharply for signs of disaffection and intimidation. Now and then he stepped to the door to see if he could discover any of those banners of which he had been told, and several times he made a sudden swoop out upon the sidewalk, and in the direction of a boy who was distributing the circulars of the boycotters. He never caught the boy, but he picked up a great many circulars, and carried them in to be burned.

A little before three o'clock John asked his uncle to take his place at the cashier's desk,—a good deal of a sinecure just then,—as he was obliged to go to the bank and make his deposits.

"Can't I go for you?" asked his uncle.

"Oh, no," said John; "I always do that myself."

The rest of the afternoon and evening passed disagreeably at Vatoldi's. As night drew on, a crowd of idlers, apparently sent there for the purpose of making the ordinary public believe that something was going to happen, stood, dispersed, and reassembled upon the sidewalk. Sometimes rough fellows would come in and demand something to drink, without anything to eat, and when told that refreshments were not served here in that fashion would complain violently, and would go away with loud words of derision and con-

tempt. Nearly every one who passed the place seemed to carry in his hand one of Bencher's circulars; and when, in the course of the evening, Mr. Stull and his friends, with other gentlemen who had determined to patronize on principle this persecuted restaurant, came in, nearly all of them ordered something or other which John had thought would not be called for in these troublous times, and which, therefore, was not on hand. If Mr. Stull said anything to John when he went up to the cashier's desk, it must have been spoken very quickly, and in an undertone, for no one noticed it. But, as he walked away, Mr. Stull's face was very red, while John's seemed troubled. At the close of the day several of the newly engaged waiters informed Mr. People that they would like to have their money for their day's work, and that they should not return. They had not understood the state of affairs when they agreed to come there, and they did not wish to mix themselves up in any such trouble. Of course no one of them said anything about the private note he had received that day from Bencher.

John had secured rooms for his mother and uncle in the boarding-house where he lived; and after the young man had taken his weary body and soul to bed, the two elders had a little confabulation in the parlor.

"If this thing goes on much longer," said Mrs. People, "it will bring that boy to his dying bed. He's pretty nigh worn out now."

"That's so," replied Enoch; "John is mighty stout on his pins, but he looks shaky, for all that."

"Pins are no good," said his sister, "no matter how fat they may be, when the mind is so troubled and tossed it can't sleep. An' just look at that Vatoldi!"

"I wish I could," said Enoch, "but I don't expect to."

"No, indeed," said Mrs. People; "it's easy enough to see that he's goin' to keep himself out of harm's way, an' trouble's way too, an' leave my boy to bear everything. I tell you what let's do, Enoch. Let's shut the place up, an' take John away. Then, if Vatoldi wants to open it again, let him come an' open it."

"That wouldn't do, Hannah; that wouldn't do," said Enoch. "If the reg'lar customers, like Mr. Stull and all them carriage people, was to find the place shut up, they'd go somewhere else, and not come back again. It won't do to spile a good business that way."

"It's a long time sence John has had a holiday," said Mrs. People, after a little pause, "an' he's always told me he couldn't have one, because there was nobody to take his place while he was gone. Now it strikes me that this is just the time for John to get his

holiday. Here's you an me on hand to be in his place; an' as long as the restaurant's boycotted there won't be much to do, an' what little business there is you an' me can attend to well enough without John."

"That's a good idea, Hannah," said Enoch, "a very good idea. As long as the business is upset, and hind-part foremost, and standing on its head, I can do what marketing is needed, and boss the waiters. But if everything was a-runnin' on as smooth and even as the fly-wheel of a steam-engine, with hundreds of people comin' in, and eatin' and drinkin', and never seein' nothin' to find fault with, then you and me would get the whole machinery out of order, because we don't understand it, and John, or somebody like him, would have to be on hand. But now we can go into this rough-and-tumble business as well as anybody, and keep things as straight as they can be kept till that lot of stupid waiters see which side their bread is buttered, and come back. Then John can take hold again, and everything go on as it used to. You're right, Hannah. This is the time for John's holiday, if he's ever goin' to get one."

"But he's got to get it!" said Mrs. People, her emotion lifting her to her feet. "I know he'll say he can't, an' he won't. But that's not goin' to make any difference with me. I'm determined he shall have a rest. Why, when he went off to bed jus' now he was about able to get upstairs, an' no more."

Enoch Bullripple had much more faith in the enduring powers of John than had been expressed by Mrs. People, but for more reasons than one he greatly desired that the young man should have a holiday. If he, Enoch, should be left in charge of Vatoldi's for a few days, he felt sure that he could get at the bottom of the mystery of the proprietorship.

"But, Hannah," said he, "I really don't see how it's goin' to be done."

"I don't neither," said Mrs. People, "but it's got to be done, an' that's the long an' the short of it."

VI.

THE two gentlemen, whose residence at the Bullripple farm had been interrupted by the boycott at Vatoldi's, found the life at Mrs. Justin's house a very pleasant one. Mr. Thorne, having come into the mountains to fish, fished; and his friend Stratford usually went with him on his excursions. In the evening this family of four adapted itself very well to cards, conversation, or twilight strolls, and the ladies found fault with Mr. Thorne because he worked so hard at his fishing, and gave none of his daytime to pursuits in which they could

take part. But he was a thoroughly conscientious young man, and as he came to the mountains to fish, he fished.

As his friend now began to know the country, Mr. Stratford frequently left him to wade the cold trout streams alone, while he gave some of his time to the entertainment of the ladies. One afternoon he took them, with the Justin horses and carriage, on a long drive through some of the valley roads. On the next day he did not go out with Mr. Thorne at all, as Mrs. Justin desired his opinion on a business letter she had received from some of her fellow-workers; and in the afternoon, Mrs. Justin having retired to the library to compose her answer, Stratford proposed to Miss Armatt that she should go in a boat on Cherry Creek, and investigate the beauty of that winding stream.

"Why, I thought the Cherry River, as I shall call it, was not navigable," said Miss Gay. "When Mr. Crisman and I wanted to go rowing, Mrs. Justin told us that it was so full of sand-bars and snags and all sorts of obstructions, that boating on it was not to be thought of."

"She was entirely right," answered Stratford; "that is, when speaking of persons not familiar with the peculiarities of the stream. It would be extremely awkward and perhaps dangerous for you and Mr. Crisman to essay boating here. But in this case it is different. I have lived here a great deal, and have made myself perfectly acquainted with the eccentricities of the river, or creek. Suppose you come and let us see what progress we can make."

"Oh, I shall be delighted," said Gay. And, tossing on her hat, she walked with Stratford to the water-side.

In rowing of the sort that was required here Stratford was an adept. With Miss Gay in the stern of the boat, and himself placed moderately well forward, so that the flat-bottomed craft should draw as little water as possible, he rowed rapidly over the deeper and open places, pulled close to one bank to avoid the shallows by the other, crushed steadily through beds of lily-pads, and once slowly and gently pushed the boat beneath the trunk of a tree which spanned the stream, keeping his eyes meantime on Gay to see that her head and shoulders were bent low enough to prevent contact with the rough overhanging bark.

As they went on, the stream became wider and deeper, and they met with fewer impediments; and it was not long before, to Miss Armatt's great delight, Stratford turned the boat into a narrow tributary stream, which, running through the heart of the woods, presented to the eye a lovely water-avenue, pass-

ing under overhanging arches of green leaves, mossy branches, and down-reaching vines. This little stream, though narrow, was deeper and much more open to the approaches of a little boat than the upper part of Cherry Creek, and for ten or fifteen minutes Stratford rowed quite steadily, keeping his head the meanwhile turned well to one side so that he should not run into either of the banks.

Then he stopped, and, drawing in the oars, said: "Now I'll rest for a time and look about me."

"You'll see nothing," exclaimed Miss Gay with sparkling eyes, "that is not perfectly lovely."

Stratford looked about him and perceived that she was quite correct. Here and there was a break in the green roof above them, and the sunlight falling in little dapples on leaf and water enhanced the beauty of the shaded vernal hues with which the scene was mainly tinged. On one bank a matted grape-vine bent down so low and wide that it formed a spreading bower over the water, under which a little boat might gently lie. On either side there were glimpses of forest beauty; beyond them, the little stream twinkled and rippled into the far-away heart of the woods, and the perfume from the young blossoms of the grape-vines filled all the air.

Miss Gay sat silent, her eyes wandering from side to side, and resting at last upon the water-bower formed by the spreading vines. Then she said: "I think I must try and remember all the twists and turns we made in coming here, so that some time I can guide Mr. Crisman to this spot. I don't believe he was ever in such a charming place."

Stratford looked into the face of Miss Gay, and across the clear blue sky of her delight he saw floating a thin gray cloud. He knew that she was thinking what a little heaven this would be if it were but her lover who was with her. But Stratford had not brought Miss Armatt here that she might tell herself how delightful it would be to sit in a boat with Mr. Crisman under that roof of odorous vines. He wanted to talk to her of herself, and this he now set about to do.

He answered her remark by saying that she would have to come over this course a good many times before she would be able to act as guide for any one else. He made no offer to be her instructor in navigation, but began to question her on the subject of her past studies and those victories in the field of learning which she still hoped to achieve. He made her understand how greatly interested he was in the objects of Mrs. Justin's life-work; and having heard from that lady so much of Miss Armatt, he wished to talk to her about

what she had done and what she intended to do.

Miss Gay was very willing to talk of these matters. She had learned from Mrs. Justin that Mr. Stratford was a man whose experience and knowledge were very great, and whose opinions were of the highest value, and she much desired to have his advice about her future studies.

But very little advice she received on this occasion. Mr. Stratford wished to look into her mind, and not to exhibit his own. Miss Gay found it very easy to talk to her companion. He seemed to want to know exactly those things which she most wished to tell him. In ten minutes she was speaking more freely of her aspirations and half-matured plans than she had ever spoken to any one before. Mrs. Justin was her dear, kind friend, and always willing to listen and assist. But Gay had perceived that there was not a perfect sympathy between them when they talked of her future intentions. Mrs. Justin wished her young friend to climb, and climb boldly, but the spot at which she would have been willing to rest content was far below the altitude on which Gay Armatt had fixed her eyes and her hopes. But here was one who not only sympathized with her in her longings, but, by his questions and his hearty interest, led her on to bring forth ideas and plans which had long been laid away in her mind because there was no one to whom she could show them. She expected to talk about all these things to Mr. Crisman after they were married; but just now their conversation never ran upon intellectual or educational topics. There were always things of a totally different sort which he wished to say to her.

But now, side by side with this courteous gentleman, this scholar and careful thinker, she walked in the regions of high thought and far-spread prospects; and when the sun had sunk so low that it no longer threw its light upon the leaves and water, and Stratford took up the oars and said it was time for them to return, he looked into her face, and on the sky of her delight there was no cloud.

Gay told Mrs. Justin all about this most delightful little excursion, and hesitated not at the same time to give vent to her high admiration of Mr. Stratford.

"It is a pity," said Mrs. Justin, "that Mr. Crisman could not have rowed you into this woodland stream."

"It would have been perfectly lovely," exclaimed Miss Gay, "if he could have been with me! But then," she added, "I should have lost that most encouraging conversation with Mr. Stratford."

The next afternoon Mr. Thorne was pre-

vailed upon to stay at home and take part in Mrs. Justin's favorite outdoor amusement, a game of croquet. Thorne was a kind-hearted man, and as willing as anybody to aid in the work of making other people happy, provided such labor did not interfere with the things which he really ought to do. But now he felt that he had done his duty in the trout streams, and that, having come into the mountains to fish, he had fished. Therefore, a four-handed game of croquet was made up.

"Gay and Mr. Thorne will play together," said Mrs. Justin, "leaving you and me for the other side."

Stratford smiled. "That will be a most agreeable arrangement for me," he said, "but I am rather sorry for Miss Armatt and Thorne."

"That is true," said Mrs. Justin. "I remember now that Gay said she had not had a mallet in her hand since she was a little girl; and you and I are both good players."

"Thorne tells me he knows but little of the game," said Stratford. "Shall I take him on my side and coach him?"

"Of course not," answered Mrs. Justin. "We won't divide in that way. You must take Gay, and I will play with Mr. Thorne."

The game proved to be a very long one, for both Mrs. Justin and Stratford were good shots and excellent managers, and they so harassed each other that advantages on either side were slowly gained. But for Gay the game was none too long. She was surprised to find that croquet, which she had supposed to be a thing of bygone days, relegated now to children and very old-fashioned grown people, was really an interesting and absorbing exercise, in which many powers of the mind, not omitting those of a mathematical nature, were brought into vigorous play. Every shot she made, every position she took, and even her manner of standing and holding her mallet were directed by Mr. Stratford; and the pleasure of doing these things properly, and of feeling that every effort had its due value, helped very much to give the game its zest. She and her partner won, and this was not because Mr. Stratford was a better player than Mrs. Justin, or that Gay knew more of the game than Mr. Thorne, but because the younger lady subordinated herself entirely to Stratford. They moved through the game as one player, neither advancing far beyond the other, and at length side by side going out of it. Mrs. Justin did not demand such subjection from her partner. She thought that sometimes he ought to rely on himself, and when he did so she generally found that he had left little that she could rely on.

As they walked towards the house, Gay Armatt said to Mrs. Justin: "I believe Mr.

Stratford would make a splendid teacher. I think he ought not to deprive the world of the benefit of his extraordinary talents in that way."

"I know Mr. Stratford has not the slightest desire," answered Mrs. Justin, "to act as teacher to the world," placing a slight emphasis on the collective noun.

Whether Stratford liked teaching or not, he and Miss Gay spent more than an hour the next morning on the back piazza of the house, with four large books from the library and an ancient atlas.

"What in the world," asked Mrs. Justin, as she came out to them, "have you two been doing here all the morning?"

"We haven't been here all the morning," said Stratford, "and we have been visiting some of the head springs of literature, and tracing the meanderings of their streams."

"You can't imagine," cried Miss Gay, "how interesting it has been! But I had no idea," looking at her watch, "that it was nearly twelve o'clock, and I have two letters to write before you send to the post-office!"

Gay ran into the house, and Mrs. Justin took her place in the chair by Stratford. "It is a pity," she said, after glancing a few moments over the atlas, "that Mr. Crisman chose to take his yachting expedition just now. It would be so much more pleasant for him to be here while you two gentlemen are in the house. I heard from Mrs. People this morning, and she says she will not be able to return home until after next Sunday at the earliest."

Mr. Stratford looked at his companion with a very small twinkle in his eye, but with a grave face. "You think," he said, "that Mr. Crisman ought to be here while we are here?"

"I cannot but believe," she said, looking steadily at Stratford, "that it would be better for his interests."

"And how about Miss Armatt's interests?" he asked.

"What do you mean?" said the lady quickly.

"Mrs. Justin," said Stratford, closing the atlas and leaning forward as he spoke, "I mean this. Miss Armatt is a young woman in whom I have taken an extraordinary interest."

"It is scarcely necessary to mention that," remarked Mrs. Justin.

"You should not be surprised," said he, "at my interest in her, for you have the same feeling yourself. You know she is a girl with an exceptional future open to her, and you would do anything in your power to help her. I am of the same mind. I believe that I comprehend very clearly her present condition of

intellectual development; and I see, too, in what directions her inclinations will lead her in regard to her future work. I think her views are not exactly sound. She needs something more than her college and her text-books can give her; and I very much hope that I shall be able to bring her to look upon literature, philosophy, and science with the eye of an untrammelled thinker. This she ought to do before she takes another step forward. And I honestly admit to you, Mrs. Justin, that I am very glad to have the opportunity, uninterrupted by Mr. Crisman's weekly visit, to do what I can to assist in the cutting and polishing of this jewel in your crown."

"You know, Mr. Stratford," said Mrs. Justin, "that I expected you to take an interest in Gay, and that I should have been very much disappointed if you had not done so; but I did not expect that she would take such a deep and absorbing interest in you."

"I cannot say," answered Stratford after a moment's pause, "that I am sorry to hear that; because if she is interested in me she will be the more likely to give an earnest attention to what I say."

"Horace Stratford," said Mrs. Justin, "did anybody ever turn you the least bit to the right or the left?"

"Yes," he answered. "Here is this young creature, with the mind of a philosopher and the heart of a girl, who has turned me entirely aside from what I thought I was going to do when I came down here."

"It is just that girl-heart which troubles me," thought Mrs. Justin. But she did not deem it proper to speak her thought. Gay Armatt was engaged to be married, and what had she or Mr. Stratford to do with her girl-heart? So she continued not this conversation; but, after gazing a moment at the vines upon the lattice-work beside her, she looked over the lawn. "What has Mr. Thorne been doing with himself this morning?" she asked. "He is now sitting alone, down there on the bench by the bank. I think he has been outrageously neglected."

"I can't agree with you," said Stratford, "for immediately after breakfast he started out on some sort of pedestrian expedition, without saying anything to me about it. I knew nothing of his intention until I saw him marching away over the hills. He is an odd fellow, and I suppose he thought it was his duty, on a fine morning like this, to walk."

"Mr. Thorne is very conscientious, is he not?" asked Mrs. Justin.

"He is entirely too conscientious."

"How can any one be too conscientious?" asked the lady with some warmth.

"It is quite possible," answered Stratford.

"Arthur Thorne has an abnormal conscience. He has cultivated it so carefully that I believe it has grown to be a thing which overshadows his life. Now I prefer, for myself, a conscience which is pruned down to healthy and vigorous growth."

"And who does the pruning?" asked Mrs. Justin.

"I do," answered Stratford with a smile. And then he went down to join Mr. Thorne upon the lawn.

"Why did you start off this morning without saying anything to me about it?" asked Stratford, as he took a seat by his friend.

Mr. Thorne smiled. "I thought," he said, "that if I asked you, politeness might impel you to go with me; and as I saw Miss Armatt alone with her books on the piazza, I knew where your chosen place would be. Would it be stepping outside of the privileges of friendship if I were to offer you my congratulations, together with my most unqualified commendation?"

"My dear Thorne," exclaimed Stratford, "your reason has taken grasshopper legs unto itself, and has jumped most wildly! Let us speak plainly. Do you suppose I am making love to Miss Armatt?"

"I supposed," said Thorne, "from the general tone of your intercourse with the young lady, that the preliminary stage of love-making had been passed, and that you were engaged."

"You amaze me!" cried Stratford. "There is nothing whatever of that sort between me and Miss Armatt! I never saw her until I came up here, about two weeks ago. I am exceedingly interested in her studies and in her prospects, and that is the basis of our intimacy."

"I shall not ask your pardon," said Mr. Thorne, "for the mistake was a compliment to your taste and good sense. I used to think that Mrs. Justin, without question, was the most charming woman of my acquaintance; but since I have seen Miss Armatt, I have revolved the matter somewhat in my mind. In fact, that was what I was doing just now when you came."

"A most profitless revolution," remarked Stratford.

As the two men walked together towards the house, it occurred to Stratford that he had not mentioned to his friend that Miss Armatt was indeed engaged to be married, though not to himself. But the subject of Mr.

Crisman was not agreeable to him, and he did not care to discuss it; therefore he said nothing about it.

That afternoon Arthur Thorne took Miss Armatt to drive in his friend Stratford's buggy. Arthur had taken lessons in driving from a professional, and he was the only man with whom Stratford would trust his horse. Mrs. Justin did not say to herself that Mr. Thorne was the only man with whom she would trust Gay, but she was very willing to have him go with her, his abnormal conscience not appearing as a fault in her eyes. It was not, perhaps, entirely suitable that Gay should go driving with any young man other than her engaged lover; but, as Mr. Crisman chose to stay away, Mrs. Justin did not feel inclined to shut up her young friend on that account.

As for Gay herself, she went very willingly with Mr. Thorne, but she could not help feeling a little disappointed that it had not been Mr. Stratford who had asked her. Several times during the drive, which was a long and interesting one, she was employed in making mental comparisons between Mr. Stratford and Mr. Thorne, at moments when the latter thought she was absorbed in contemplation of the landscape. And yet she liked Mr. Thorne very much, and would probably like him better when she knew him better. There was here none of that fire-and-wax sympathy which had shown itself in the early stages of her acquaintance with Mr. Stratford. Mr. Thorne spoke but little on those subjects in which her mind was most deeply interested, and what he did say was not at all what Mr. Stratford would have said. But she felt, when she returned from her drive, that she had spent the afternoon with one who was truly a gentleman. Mr. Thorne had done nothing which was peculiarly adapted to produce this impression, but the impression had been produced; and Gay Armatt could not help thinking that it was a very pleasant thing to be in the company of persons who were truly gentlemen.

But, in her thoughts, Gay instituted no comparisons between Mr. Crisman and other men. Other men were other men, and had their faults and their merits. But Mr. Crisman was in a different sphere altogether; he was her lover, and she was to marry him; and with him criticism and comparison had nothing to do.

(To be continued.)

OLD CHELSEA. II.

THE WESTERN END OF CHEYNE WALK.

ALL that is now left of Paradise Row, across the road from Ranelagh Gardens, is half a dozen small brick cottages, with tiny gardens in front, and vines climbing above. Once, when all about here was country, these houses must have been really delightful, and have justified the name, as they looked out on pleasant parterres, terraced to the river. Unpretending as they are, they have harbored many historic personages. In Paradise Row—it is now partly Queen's Road West—lived the first Duke of St. Albans, Nell Gwynne's son, not far from the more modest mansion of his venerated grandmother. Here lived the Earls of Pelham and of Sandwich, and the Duchess of Hamilton. At the corner of Robinson's Lane stood Lord Robarte's house, wherein he gave the famous supper to Charles II. on the 4th of September, 1660, and was soon after made Earl of Radnor; whence the street of that name hard by. On April 19, 1665, Pepys visited him here, and "found it to be the prettiest contrived house that ever I saw in my life." A quiet, quaint old public-

house, "The Chelsea Pensioner," stands where Faulkner, the historian of Chelsea, worked with such pains on his driest of records, yet to which we are all glad to go for our facts about Chelsea. This row of poor little plaster-fronted cottages, running to Christchurch Street, is all that is left of old Ormond Row; and the swinging sign over the "Ormond Dairy" is all we have to commemorate old Ormond House, which stood just here, its gardens, in which Walpole's later house was built, sloping to the river-bank.

Let us stop again before the little two-storied house, the easternmost of Paradise Row, standing discreetly back from the street behind a prim plot of grass. Well-wrought iron gates are swung on square gate-posts, atop of each of which is an old-fashioned stone globe, seldom seen nowadays. A queer little sounding-board projects over the small door, and above the little windows we read: "School of Discipline, Instituted A. D. 1825." It is the oldest school of the sort in London, founded by Elizabeth Fry, and in it young girls, forty-two at a time, each staying two years, "are reformed for five shillings a week," and fitted for domestic service. They wear

very queer aprons, their hair is plastered properly, and their shoes are clumsy; and no stranger contrast was ever invented than that between them and the perfumed, curled, high-heeled dame who once lived here.

Hortensia Mancini, the daughter of Cardinal Mazarin's sister, had been married while very young to some duke, who took the name of Mazarin on his marriage. A religious fanatic, he soon shut her up in a convent, from which she ran away, and reached England in boy's costume; but, as Rumigny wrote, "she has entered the English court as Armida en-

tered the camp of Godfrey." As the handsomest woman in Europe, her coming caused commotion at the court with her rivals and in the breast of Charles II., on whom during his exile Hortensia Mancini had made an impression. She became the vogue for a while, and lived luxuriously; but this little house was her last residence, and here, although reduced to poverty by her extravagance,—too poor even to pay her butcher and baker,—she continued to give fashionable dinners, for which each guest paid by leaving his money under his napkin, so old Lysons heard. For

all that, her house was the favorite resort of men famous by birth and brains; here Charles II. was fond of coming; here St. Evremond wrote poetry for her, advised her, worshiped her.

Mary Astell was a near neighbor of, and a curious contrast with, the Duchess of Mazarin, at whom she pointed in her writings as a warning of the doom decreed to beauty and to wit, when shackled in slavery to man. *She* devoted herself "to the propagation of virtue," as Smollett satirically put it. Congreve satirized her too; Swift stained her with his

sneers as "Madonella"; Addison and Steele made fun of her in their gentler way. Doubtless there was something of *la Précieuse Ridicule* to that generation in the aspect of this most learned lady, who wrote pamphlets and essays, in which, following More's lead, she urged the higher education of her sex. Failing to found among her female friends a college or community for celibacy and study, she induced Lady Elizabeth Hastings and other noble ladies to endow in 1729 a school for the daughters of old

TURNER'S LAST DWELLING-PLACE.

pensioners of the Royal Hospital; and this has grown to the present grand asylum for clothing, educating, and caring for these girls.

Turning from Paradise Row, we pass Gough House, with its two centuries of social history, for which we cannot here pause. The great square mansion is now the Victoria Hospital for Children, doing beneficent work. Passing through Tite street, we come, in refreshing contrast with its ambitious artificiality, to a bit of genuine nature, the Botanical Gardens, which front just here on the embankment. They remain intact as when in 1673 four acres of Lord Cheyne's domain were made over to the Society of Apothecaries for "the Chelsea Physick Garden," and to build thereon a barge-house and offices for their convenience when they came up the river.

These buildings were demolished in 1853, but the gardens have bravely held out against the vandal hordes of bricklayers and builders; and all the herbs of *materia medica* which can grow in the open air are cultivated to this very day for the instruction of medical students, just as when Dr. Johnson's *Polyphilus*—the universal genius of a "Rambler"—started to come out here from London streets to see a new plant in flower.

Here Hans Sloane studied, and when he became rich and famous, and bought the manor of Chelsea, he gave the freehold of this garden to the Apothecaries' Company on condition that it should be cultivated forever for the use of medical students. His statue, erected in 1733, stands in the middle of the garden, chipped and stained by wind and weather.

TITE STREET.

Westward a little way stands "Swan House," on the site of the "Old Swan Tavern," which has been gone this fifty years now. It stood right over the river, with projecting wooden balconies, and a land entrance from Queen's Road. It and its predecessor—a little lower down the river—were historic public-houses resorted to by parties pleasuring from town; it was a house of call for watermen with their wherries, as we have so well pictured in Marryat's "Jacob Faithful." Here Pepys turned back on April 9, 1666, having rowed up with a merry party, and "got affright at the Swan," on hearing that the plague had broken out in this suburb. Until the "Old Swan" was torn down, it served as the goal for the annual race rowed even yet by the Thames watermen for the prize instituted by Dogget, a fine low

comedian of Queen Anne's time,—an orange-colored waterman's coat and a silver medal stamped with the white horse of Hanover.

Just beyond, at Flood Street, begins Cheyne Walk, still, despite embankments and gas and cabs, the most old-fashioned, dignified, and impressive spot in all London. Its modest brick houses have not been spoiled by too many modern improvements; they are prim and respectable, clad in a sedate, secluded sobriety, not at all of this century. Their little front gardens are unpretending and almost sad. Between them and the street are fine specimens of old wrought iron in railways and gates, in last century brackets for lamps before gas came in, in iron extinguishers for the links they used to carry. "Hans Sloane House" is wrought, in open letters, in the gate of No. 17; in others the numbers alone are thus worked in the antique pattern. "Manor House" has an attractive old plaster front. A shining brass plate on another, with "Gothic House" in well-worn letters, is just what we want to find there. In No. 4 died, on the night of the 22d of December, 1880, Mrs. John Walter Cross, more widely known as George Eliot. Maclise, the painter, died in the same house many years before. It has recently been "done up new," and so spoilt for us, I am sorry to say. So, too, has No. 16, the "Rossetti House," a large, double-front bowing out in the middle, the famous drawing-room on the first floor taking the whole width. The hall, staircases, every room, are paneled from entrance to garret, and the place had a dreary and not reverend aspect as I went through it, just before its new occupants took it.

I am told that in the foundations of this house there are to be seen remains of the old Tudor stone-work of Henry VIII.'s palace, and in the adjacent houses heavy nail-studded doors and similar remnants of that palace, built just here by the King, who had learned to like Chelsea in his visits to More. Nothing is left of it save those foundations and the apocryphal bits spoken of, but we can easily trace its grand grounds and gar-

dens, covered with houses and streets as they are. Rossetti's great garden—now almost covered by a new Board school—was undoubtedly part of the palace grounds, other portions of which are found in the back gardens all along this part of Cheyne Walk. In the large garden of Mr. Druse there stand some very ancient trees, and I saw there, not very long ago,—but gone forever now,—a bit of crumbling wall, an arch, and within it remains of the old hinges on which a gate was once hung. That gate gave entrance from the land side by a path leading across the fields from the King's Road to the palace grounds; through it Seymour slipped to his secret visits to Catherine

GATEWAY OF ROSSETTI'S OLD HOUSE.

STATUE OF THOMAS CARLYLE, BY BOEHM.

Parr, as we know by a letter of hers: "I pray you let me have a knowledge over-night at what hour ye will come, that your portress may wait at the gate to the fields for you." She and Seymour had their historic romps under these very trees with the Princess Elizabeth, then a girl of thirteen, at home here.

She had come to live in the manor-house at the age of four, that she might grow up in that healthful air, her father placing, with his customary delicacy, the daughter of Anne Boleyn under the care and tuition and example of his latest wife, the staid and

studious Catherine Parr. To this latter the King had given, on their marriage, the manor-house as her jointure, and there she lived in great state after Henry's death. Already before their marriage, while a wistful widow, she had been bewitched by Seymour, and had meant to marry him, but for being forced to submit to the King's will to make her his queen. Henry died at the end of January, 1547, and in May his widow, but thirty-five years old, secretly married Seymour. He was a turbulent, unscrupulous, handsome rascal, a greedy gambler, an insane intriguer, brother

of the Protector Somerset, maternal uncle of King Edward VII., brother-in-law of the King, and had tried to marry the Princess Elizabeth, then a girl of thirteen or fourteen, even while coquetting with the Queen-dowager, Catherine Parr. The girl, with her Boleyn blood, doubtless delighted in the mystery of the secret visits, which she knew of, and in the secret marriage she surely suspected. The Queen-dowager must have found it a trying and turbulent task to train her, and had more comfort in her other pupil, little Lady Jane Grey, who came here often for a visit and

Hans Sloane had come up to London, a young Irish student of medicine; and, frequenting the Botanical Gardens, just beyond in Chelsea, he must often have looked at, and perhaps longed to live in, the roomy old mansion. After his return from Jamaica, he pursued his studies with such success that he was made President of the Royal Society on the death of Sir Isaac Newton, in 1727. He became a famous physician, was doctor to the Queens, Anne and Caroline, as well as to George I., who made him a baronet in 1716, the first physician so ennobled in England. As

he grew in wealth, he bought much property in Chelsea: first this manor-house, then More's house, then in other quarters. His name is perpetuated in Sloane Square and Hans Place, and his property now forms the estate of the Earl of Cadogan, whose ancestor, the famous General Cadogan, a colonel of the Horse Guards in Marlborough's wars, married Elizabeth, daughter and co-heiress of Sir Hans Sloane; so that the present Earl of Cadogan is "lord of the manor and Viscount Chelsey."

But greater than his riches, better than all his other services, is the fact that Sir Hans Sloane was the founder of the British Museum. The extraordinary collec-

CARLYLE'S HOUSE, GREAT CHEYNE ROW.

for sympathy in the studies in which she was already a prodigy, even then, at the age of eleven. She is a pure and perfect picture, this lovely and gentle girl, amid all these cruel and crafty creatures; but we cannot follow her farther in the touching tragedy in which she played the innocent usurper, the blameless martyr. Nor can we say more of Catherine Parr, probably poisoned by her husband, nor of his death on the block, nor of the rascally and wretched record of the future owners of this manor-house, but come down to the year 1712, when it was sold by Lord William Cheyne, lord of the manor, to Sir Hans Sloane.

tion in natural history, of books and of manuscripts, with which his house in Bloomsbury was filled, and which then overflowed into his Chelsea house, was left by him to the nation, on payment to his estate of only twenty thousand pounds, it having cost him not less than fifty thousand pounds. Parliament passed the appropriation, the purchase was perfected, and this little pond has now grown into the great ocean of the British Museum, on the shores of which we who come to scoop up our small spoonfuls of knowledge are cared for so courteously by its guardians.

There was an Irish servant of Sir Hans

A TABLET FROM A STREET CORNER.

Sloane, one Salter, who established himself in 1695 as a barber in a little house in Cheyne Walk, which stood on the site of the present No. 18,—“six doors beyond Manor Street,” contemporary papers say, and I have no doubt this is the correct site. Salter was a thin little man, with a hungry look, as of one fond of philosophy or of fretting; and Vice-Admiral Munden, just home from years of service on the Spanish coast, dubbed him, in a freak, Don Saltero, which title he carried to his death. He took in all the papers, and had musical instruments lying about,—he himself twanged, Don-like, the guitar,—that his customers might divert themselves while waiting their turns. His master had given him a lot of rubbish for which his house had no more room, as well as duplicates of curiosities of real value in the museum in Bloomsbury. To these he added others of his own invention, until there were “ten thousand gimcracks on the walls and ceiling,” as the “Tatler” put it in a narrative of a voyage to Chelsea; for Don Saltero’s museum, barber’s shop, reading-room, coffee-house, had become quite the vogue, and a favorite lounge for men of quality. Old St. Evremond was probably among the first to be shaved here; Richard Cromwell used to come often and sit silently,—“a little and very neat old man, with a placid countenance, the effect of his innocent and unambitious life.” Steele and Addison and their friends were frequent visitors “to the Coffee House where the Literati sit in council.” And there came here, one day about 1724 or 1725, a young man of

eighteen or twenty years, out for a holiday from the printing-press at which he worked in Bartholomew Close, Benjamin Franklin by name, recently arrived from the loyal colonies of North America, and lodging in Little Britain. He had brought with him to London a purse of asbestos, which Sir Hans Sloane, hearing of, bought at a handsome price, and added it to his museum, to which he gave the young printer an invitation, and told him about Don Saltero’s probably. It was on Franklin’s return from there—the party went by river, of course—that he undressed and leaped into the water. “I swam from near Chelsea the whole way to Blackfriars Bridge, exhibiting during the course a variety of feats of activity and address, both upon the surface of the water, as well as under it. This sight occasioned much astonishment and pleasure to those to whom it was new.”

It is a far cry from Dick Steele to Charles Lamb, yet the latter, too, makes mention of Don Saltero’s in a letter,—saying that he had offered to him, by a fellow-clerk in the India House, all the ornaments of the Don’s smoking-room at the time of the auction sale, when the collection was dispersed. This was in 1807, and the place was then turned into a tavern, its old sign, “Don Saltero’s, 1695,” gold letters on a green board, swinging between beams in front until its demolition only twenty years ago.

A little farther on, just west of Oakley Street, on the outer edge of Cheyne Walk, still stands an old sign at which I often look in delight, unshamed by the mute mockery of the pass-

D. G. ROSSETTI'S GARDEN.

OLD BATTERSEA CHURCH, WHERE BLAKE WAS MARRIED, SHOWING WINDOW FROM WHICH TURNER SKETCHED.

ing Briton, wondering what the sentimental prowler can see to attract him in this rusty relic. It stands in front of the little public-house, "The Magpie and Stump," two solid posts carrying a wide cross-piece, all bristling with spikes, for the impalement of the climbing boy of the period,— "Magpie and Stump, Quoit Grounds," in dingy letters on the outer side, once plain for all rowing men to read from the river; above is an iron magpie on an iron stump, both decrepit with age, and a rusty old weathercock, too stiff to turn even the letter *E*, alone left of the four points of the compass. Between these posts you may still trace the top stone of an old water-staircase, imbedded now in the new-made ground which forms the embankment-garden here; just as you might have seen, only the other day, the water-stairs of Whitehall Palace, which have now been carted away. Up this staircase Queen Elizabeth has often stepped, on her frequent visits to the rich and powerful Earl of Shrewsbury, her devoted subject and friend; for just back of Cheyne Walk here, on the river-slope, stood until the beginning of this century Shrewsbury House, an irregular brick structure, much gabled, built about a quadrangle. Although but one story in height, it was sufficiently spacious, its great room being one hundred and twenty feet in length, and its oratory painted to resemble marble. It was one of the five grand mansions of Chelsea.

We pass the site of another notable mansion,

the ancient palace of the Bishops of Winchester, which stood on the river-bank until within seventy years, just where broad Oakley Street runs up from opposite the Albert Suspension Bridge, concerning the history and the inmates of which there is much of real interest, not to be narrated here. Farther along Cheyne Walk we turn into Lawrence Street, at the upper end of which, at the corner of Justice Walk, you may find in the cellars of "The Prince of Wales" tavern and of the adjoining houses the remains of the ovens and baking-rooms of the famous Chelsea china-factory. For it stood just here during the short forty years it existed, having been established in 1745. Why it failed, and why the factory was torn down, no one seems to know; for it produced extremely fine work, and its best ware — turned out from 1750 to 1765 — was equal to that of Sèvres. Skilled foreign workmen had been brought over, and an extraordinary specimen of unskilled native workman appeared in Dr. Samuel Johnson. The old scholar conceived the idea that he could make china as admirably as he could a dictionary; but he never mastered the secret of mixing it, and each piece of his cracked in the baking! He used to come out here twice a week, with his old housekeeper carrying the basket of food for the day's work, and was free of the whole factory, except the mixing-room. They presented him a full service of their own make, however, which he gave or bequeathed to Mrs. Piozzi, and which, at the

sale of Mrs. Piozzi's effects, was bought by Lord Holland. In Holland House, Kensington, I have seen it, carefully preserved among the other famed curios.

"This is Danvers street, begun in ye yeare 1696," says the quaint old lettering in the corner house of Cheyne Walk; and this street marks the site of Danvers House, which had formed part of More's property — perhaps the "new buildinge" which had gone to his son-in-law Roper. It came afterward to be owned by Sir John Danvers, a gentleman-usher of Charles I., and he made a superb place of it, of which the deep foundations and the fallen columns now lie under Paulton Square, at the upper end of the street. Sir John Danvers was the second husband of a woman notable for her famous family of boys; her first son was that strong and strange original, Lord Herbert of Cherbury; her fifth son was George Herbert, of undying memory. The poet lived here for a while. Donne, the preacher, then at Oxford, used to stop here on his visits to London; and when he became vicar of St. Dunstan's-in-the-West, in the Strand, near Isaac Walton's old shop in Chancery Lane, he converted the gentle angler, and these two certainly strolled often out here together. Donne preached Lady Danvers's funeral sermon in the old Chelsea church in 1627 — one of his most touching sermons, it is said.

In the embankment gardens we have passed a statue recently placed there: a man seated in a chair, uncouth of figure, with bent brow and rugged face. And in the wall of the corner house behind we stop to look at a small memorial tablet, still more recently placed, a medallion portrait of the same face, and beneath this inscription: "Thomas Carlyle lived at 24 Cheyne Row, 1834-81." For this is not the house in which he lived, and the tablet is fixed here with queer common sense, his own being in Chancery! It is to be found farther up in this little dull street running from Cheyne Walk here, in which there is nothing that is not commonplace, save the little cottage covered with vines, in the wall above which is a stone with odd old-fashioned lettering, "This is Gt. Cheyne Row, 1708." About the middle of the row of small dreary brick houses, the one once numbered 5, now 24, is that in which he dwelt for nearly fifty years, and wherein he wrote his commination service large on all mankind, talking more eloquently, and more loquaciously withal, in praise of silence than any man who ever scolded all through life in honor of the strong arm and the silent tongue. The view across the narrow street from his front windows — "looks out mainly into trees," he wrote to Sir William Hamilton soon after moving here —

shows now nothing but a long, low, dreary wall, above which rises a many-windowed model dwelling-house, and is surely one of the least inspiring in all London; while from the back he could see nothing of interest except the last piece of the old wall of Henry VIII.'s manor-house garden, which still stands here. It gave him a hint in his pamphlet, "Shooting Niagara," wherein, speaking with contempt of modern bricks and bricklayers, he refers to this sixteenth century wall, still so sound and solid.

Long before his day there had lived, almost on this same spot, another "hermit of Chelsea," in the person of Dr. Tobias Smollett, who came here to live in retirement in 1750, fresh from the fame of his "Roderick Random," seeking such seclusion partly on account of his daughter's health and his own, and partly for the sake of his work. Here he wrote "Ferdinand Count Fathom," finished Hume's "History of England," and began his translation of "Don Quixote"; and here took place those Sunday dinners, the delicious description of which, and of the guests, he has put into the mouth of young Jerry Melford in "Humphrey Clinker." Here were spent some of his happiest days with his work and his friends from town, Johnson, Garrick, Sterne, John Wilkes, John Hunter, — the last probably coming from Earl's Court, Kensington, where his place — mansion, museum, and menagerie in one — is still standing. Smollett was as well known in the streets of Chelsea in his day as Carlyle in ours — "a good-sized, strongly made man, graceful, dignified, and pleasant."

It was a fine old place, with extensive grounds, which Smollett took — being the ancient manor-house of the Lawrences, once owned by Henry VIII., as we have seen. The house stood exactly on the site of the block of two-storied brick cottages called "Little Cheyne Row," between Great Cheyne Row and Lawrence Street. Its history has little that need detain us, until, in 1714, it became Monmouth House, from its new owner, the Duchess of Monmouth and Buccleuch, who came here with Gay as her domestic steward or secretary, and who lived to the age of ninety. Faulkner, writing in 1829, says that Monmouth House was then "a melancholy scene of desolation and ruin"; and it was finally torn down and carted away in 1834.

The grounds of Monmouth House must have stretched back to those of the rectory of St. Luke's, a step to the northward. The rectory is an irregular brick building, delightful to the eye, set in an old-fashioned lawn with great trees, its tranquillity assured by a high brick wall. It is a very old house, built

by the Marquis of Winchester, and granted by him to the parish on May 6, 1566, at the request of Queen Elizabeth. Glebe Place, just at hand, shows the sight of the glebe land given in her time in exchange for the older parsonage, which stood still farther west behind Millman's Row.

The historic interest of this Chelsea rectory, however, is dwarfed by its personal appeal to all of us, for it was the home of three notable boys, in the order of their ages, Charles, George, and Henry Kingsley. They came here in the year 1836, their father, the Rev. Charles Kingsley, having received the living of St. Luke's, Chelsea, from Lord Cadogan. So their beloved west-country life was exchanged for the prim, parochial prosiness which made such a doleful difference to them all; for these boys were born, it seems to me, with the instant love of life and movement in their blood. Charles has shown it in almost everything he wrote; Henry gave utterance to it in his books, only in a less degree, because it found vent in his years of wandering; while George—better known as "The Doctor"—appears at spasmodic intervals at his home on Highgate Hill for a little while, then plunges into space again, and is vaguely heard of, now yachting in the South Seas, now conversing delightfully in a mining camp of Colorado. Henry, the youngest, was a sensitive, shy lad, delicate in health, and the old dames in this neighborhood tell of his quiet manner and modest bearing. Henry was born in 1830, studied at King's College, London, for a little over two years, 1844-6; his name was entered at Worcester College, Oxford, March 6, 1850, where he kept ten terms, leaving at Easter, 1853, without taking his degree. The Australian "gold-digging fever" was then raging, and he started for that country with two friends. There he did all sorts of things: tried mining, tried herding, became a stockman, was in the mounted police, and after five years of these varied vocations returned to England with no gold in his pockets. It was all in his brain: a precious possession of experience of life and of men, to be coined into the characters and the scenes which have passed current all over the globe. All his Australian stories are admirable, and "Geoffrey Hamlyn"—his first work, produced soon after his return, in 1859—is the best tale of colonial life ever written. His parents had intended that he should take holy orders and perhaps succeed his father in the living of old St. Luke's; but he felt himself unfitted for this profession, as he also found himself unfitted for that of the journalist, which he tried for a while when he came back to England, albeit as a correspondent he displayed dash enough, and after the

surrender of Sedan was the first man to enter within the French lines. He found his proper place as an essayist and a novelist, and in all his works there is to me a strange and nameless charm—a quaint humor, a genuine sentiment, an atmosphere all his own, breezy, buoyant, boyish, seeming to show a personality behind all his creations, that of their creator, a fair, frank, fresh-hearted man. He had true artistic talent, too, inherited from his grandfather, and he may have been just in judging himself capable of gaining far greater reputation as a painter than as a novelist even. His skill in drawing was amazing, and the few water-colors and oils left to his family—and unknown outside of its members—are masterpieces. On his return from Australia he lived with his mother at "The Cottage" at Eversley, never caring for Chelsea after the death of his father. He was married in 1864 by Charles Kingsley and Gerald Blunt, the present rector of Chelsea. On May 24, 1876, "on the vigil of the Ascension," only forty-six years of age, he died at Cuckfield, Sussex, which quiet retreat he had chosen twelve months before.

Henry Kingsley especially appeals to us, just here, for that he has given us, in "The Hillyars and Burtons," so vivid a picture of modern Chelsea: its streets and by-ways, its old houses, and its venerable church, in delightful detail, as he saw them when a boy. The Hillyar family is a romantic reproduction of that ancient Chelsea family, the Lawrences. In the Burtons he gives us his reminiscence of the Wyatt household, living at Wargrave, Henley-on-Thames. The brave girl, Emma Burton, is a portrait of Emma Wyatt. The old home of the Burtons—"the very large house which stood by itself, as it were, fronting the buildings opposite our forge, which contained twenty-five rooms, some of them very large, and which was called by us, indifferently, Church Place, or Queen Elizabeth's Place"—*this* was the only one of the grand mansions of Chelsea left standing when the Kingsleys came there. "It had been in reality the palace of the young Earl of Essex, a very large three-storied house of old brick, with stone-mullioned windows and doorways." You may see a print of it in "kind old Mr. Faulkner's" book, as he found it in 1830, dilapidated then, and let out to many tenants. Later, it sank lower still; and finally the grand old fabric, "which had been trodden often enough by the statesmen and dandies of Queen Elizabeth's court, and most certainly by the mighty woman herself," was demolished between 1840 and 1842.

From this ancient site I often walk down old Church Lane, now Church Street, to where,

at its foot, stands "Chelsea Old Church" — rather a delightful old church, if you sit here of an autumn afternoon, the sun streaming in from the south-west, slanting on the stone effigies, and the breeze breathing in through the little door beside More's monument, shaking the grass outside, and the noble river sparkling beyond the embankment garden. To me it has more of fascination than any church in London. Its entire absence of architectural effect, in its varying styles; its retention to this day of the simplicity of the village church, even as when built; its many monuments and mural tablets, each one a page of English history; its family escutcheons; its tattered battle-flags hung above; the living memories that are built in with every dead stone — all these combine to make it the quaintest, the most impressive, the most lovable of churches. Sir Thomas More's black marble slab, set deep under a plain gray Gothic arch, is placed on the chancel wall, just where he used to stand in his "surplisse"; above it is his crest, a moor's head on a shield; and on it is cut his own long Latin inscription, sent by him to his friend Erasmus, who thought it worth printing in his collection of "Tracts and Letters, Antwerp, 1534." Twice have the characters been recut, and each time has care been taken, for his memory's sake, to leave blank the last word of the line, which describes him as "troublesome to thieves, murderers, and *heretics*." To the sturdy old Catholic these were all equal — all criminals to be put out of the way. The irony of chance has placed a tablet on the wall close beside his tomb which keeps alive the name of a Tyndale, of the family of that one whose books More burnt, and whose body he would probably have liked to burn also! His two wives are buried here, as well as others of his family; but whether his body lies here, or in a Tower grave, no one knows.

Three of Chelsea's grandest ladies lie under monuments in the church: Lady Dacre and her husband Gregory, with their dogs at their feet; Lady Jane Cheyne and her worthy husband Charles (notably did she benefit this church, towards the rebuilding of which she gave largely); and the great Duchess of Northumberland, mother of Elizabeth's Leicester, grandmother of Sir Philip Sidney.

In the Lawrence chapel we see a strange survival of a common custom of the pre-Reformation times, when a great family was wont to build and own its private chapel in the parish church, using it for worship during life, for burial in death, and deeding or bequeathing it as they did any other real estate. When Sir Thomas Lawrence became lord of the manor, he partly bought and

partly built this chapel; and now, although it forms the entire east end of the north aisle, it has not been modernized, like the rest of the church, but retains its high-backed pews and other ancient peculiarities unchanged since the church was repaired in 1667. Here is the quaint monument, in the Lawrence chapel, where, under a little arch, supported by columns, kneel wife and husband face to face, he in his armor, his three simple-seeming sons in ruffs kneeling behind him; she in her heavy stiff dress, six daughters on their knees in a dutiful row, and two dead babies on the cushion before her. It is still private property, belonging to the family to whom it has descended from the Lawrences, and to them goes the income from its pews.

Outside, the tiny graveyard is filled with slabs and monuments, many of them ugly, some curious, a few fine; from the stately tomb of Sir Hans Sloane and his wife — an urn entwisted with Æsculapian serpents, under a marble canopy — to the simple slab of Dr. Chamberlayne and his family, worn with wind and weather — whose daughter Anne, more famous than any of her brothers, "long declining wedlock, and aspiring above her sex and age, fought under her brother with arms and manly attire, in a fire-ship, against the French, on the 30th June, 1690 — a maiden heroine"! She was then but twenty-three, and did not grow in courage with her years, for she soon after consented to marry one Spraggs, and then died! Among many unknown ones buried here are Magdalen Herbert, Shadwell, the poet laureate, Woodfall, the publisher of "Junius," and Sir John Fielding, the blind magistrate of Bow Street, half-brother of the novelist.

As we stand here, the broad embankment, with its gay gardens, stretches between us and the river, spanned just above by old Battersea Bridge, the only wooden bridge left to the Thames here since that of Putney has gone. For centuries there had been a ferry just here, granted by James I. to some of his "dear relations" for forty pounds. In 1771 this bridge was built for foot-passengers only at first, enlarged later, and now comes to be used again only by foot-passengers, for it is condemned for carriage traffic, and is soon to be pulled down. Its rude and reverend timbers are already propped up here and there. Stand midway on it with me, while the ceaseless stream of men flows by, caring nothing for that which we are looking at.

On our right, along the southern shore, stretches Battersea Park, fringed with its great masses of cool foliage, where not long ago were marshes and meadows, and the barren, bleak Battersea fields.

Beyond the bridge, back of us, rises the square, squat tower of St. Mary's, Battersea, buildd in the best church-warden style, and otherwise notable for that therein was married Blake the madman; that therein Turner loved to sit at the vestry window and sketch; and that therein lie the remains and stand the monuments of St. John Bolingbroke, and of his second wife, niece of Madame de Maintenon—both their epitaphs written by him. Not far from the church, next to the mill, on the river-bank, still stands one wing of Bolingbroke House, in which St. John was born, to which he returned from his stormy exile to pass his remaining days in study, and there to die. Through its many old-time rooms, with famous "sprawling" Verrio's ceiling paintings, I will lead you into the historic cedar-room, on the river-front, Bolingbroke's favorite sitting-room, whose four walls, all of cedar from floor to ceiling, are still as redolent as when Pope, Bolingbroke's guest, began in it his "Essay on Man"; and these two used to sit here with those other two—Chesterfield and Swift—of that brilliant quartette who hated and attacked Walpole. His house—Sir Robert's—forms part of the great mass of Chelsea Hospital, dim in the distance before us; between stretches the old Dutch front of Cheyne Walk, which near at hand resolves itself into most ancient houses, with quaint windows in their sloping roofs, their red tiles, and chocolate-colored bricks dark behind the green of the old lime-trees. Farther beyond the bridge are two buildings which bring the old and the new also close together: the "World's End Tavern," at the end of the passage of that name, famous three centuries ago as a rendezvous for improper parties, introduced in Congreve's "Love for Love" in that connection; and just west of the sedate little "public," "The Aquatic Stores," are two tiny houses set back from the embankment; stone steps lead down to their minute front gardens; on one of them vines clamber up to an iron balcony on the roof. That balcony was put there for his convenience by Turner the painter, and in that house, No. 119 Cheyne Walk, he lived for many years, and in that front room he died, on the 18th December, 1851. To that upper window, no longer able to paint, too feeble to

walk, he was wheeled every morning during his last days, that he might lose no light of the December sun on his beloved Thames. In Battersea church you may sit in the little vestry window wherein he was wont to sketch. The story of his escape from his grand and gloomy mansion in Queen Anne street is well known; he never returned to it, but made his home here with the burly Mrs. Booth. After long hunting, his aged housekeeper, in company with another decrepit dame, found him in hiding only the day before his death. The barber's son of Maiden Lane lies in the great cathedral of St. Paul's, and the evil that he did is buried with him—his eccentricity, his madness if you will; but he lives for all time as the greatest landscape-painter England has known.

The autumn day is waning, and the western sky, flaming with fading fires, floods broad Chelsea Reach with waves of dusky gold. The evening mist rises slowly, as yet hiding nothing, but transforming even commonplace objects in a weird, unwonted way. Those pretentious blocks of new mansions loom almost lordly now; the distant railway bridge is a ghost of graceful glimmering arches; money-making factory chimneys and commercial wharves pretend to picturesque possibilities; clumpish barges, sprawling on the mud, are no longer ugly; and a broad-bottomed coasting schooner, unloading stone at a dock, is just what we would select to see there. And here at the end of the bridge is a fragment of "real old Chelsea," left intact for our delectation: a clump of drooping trees on the bank, an unaccountable boat-house, stone steps leading down to a bit of beach, whereon are skiffs drawn up, and cordage lying about, and sail-wrapped spars. Out in the Reach there is but little movement: the river steamboats are anchored in a dark mass near the shore, and the last one edges up to its mooring beside them for the night; a burly barge drifts slowly under its dusky brown sails, or a "dumb-barge" floats with the tide, its crew of one man busied with his long sculls and his not-dumb blasphemy; a puffing tug with a red light in its nose drags anxiously a long line of tarpaulin-covered canal-boats. And each of these moving objects breaks the burnished waves into a golden gloom.

THE END.

Benjamin Ellis Martin.

SONGS OF CHRISTMAS.

I. CHRISTMAS EVE.

A legend tells us that on Christmas Eve the Christ-child, after visiting mortals, goes to Fairy-land, and there stays till morning light. If any of the fairy folk choose to follow him, he takes them with him; they are born on earth as human beings, and if faithful are saved.

“HASTEN, brothers, hasten!
Ringing sweet and clear,
Fairy bells are chiming,
Christmas Eve is near!
Then the dear Child Jesus,
All in robes of white,
Dances with us gayly
Till the morning light!”

Down the mountains tumbling,
Laughing in their glee,
Sliding on the ice-bridge
O'er the Baltic Sea,
Scamp'ring thro' the valleys,—
Rubezahl ahead,—
See! the Trolls are coming,
All with caps of red.

Here the Gnomes are leaping
Down the mountain-side,
Springing from the caverns
Where they always hide.
Hasting through the forest
Now the Elves are seen;
Hear their bridles jingle!
See their plumes of green!

Riding on the snow-flakes,
Sailing down the streams,
Racing o'er the ice-plains
With their fairy teams,
Led by Queen Titania,
Fairest of the fair,
See the merry wee folk
Trooping through the air.

“Hasten, brothers, hasten!
Ringing sweet and clear,
Fairy bells are chiming,
Christmas Eve is here!
Now the dear Child Jesus,
All in robes of white,
Dances with us gayly
Till the morning light.”

II. NOËL.

Being what *might* have been sung in the days of Fra Angelico.

NOËL! Noël!
Hail to the day when Christ was born!
All in the early, early morn
Meek Mary Mother
Her baby kist:
The wond'ring oxen
I ween were whist.
Oh, but the babe was fair to see!

Noël! Noël!
“Jesu, my son, what aileth thee?
Why dost thou look with tears on me?
Thy Mother Mary,
I hold thee warm,
Thy head is pillowed
Upon my arm.”
Oh, but the tears ran down his face!

Noël! Noël!
“Mother, thy breast, my resting-place,
Soon shall I pierce; God grant thee grace.
For Adam's children
Thy only son
Must suffer anguish
Till life is done.
Oh, but my tears run down for thee!”

Noël! Noël!
“Jesu, my son, alas, I see
Dolor and scorn for thee and me.
Yet bless thy mother
A little while,
And smile, my baby,
Upon me smile.
Oh, but I'll love thee, tho' I mourn!”

Noël! Noël!
Hail to the day when Christ was born!
All in the early, early morn
Slept Mary Mother
And Jesu sweet,
While angels watching
Knelt at their feet.
Oh, but the stable shone that morn!

Noël! Noël!
Hail to the day when Christ was born!
Gentles and dames, on Christmas morn

Came down the Saviour
Of sinful men;
Now give him welcome
To earth again.
Noël! Noël!

Sing with us all, our Lord is born!
Noël! Noël

III. CHRISTMAS MORNING.

Being what some might think almost any Christmas day in our own time.

KEEN blew the wind across the naked wold,
Glimmered the snow-fields white;
Aweary with my longing, doubt, and pain,
I watched the silent night.

Ah me! joy comes and goes, but grief remains;
My days small comfort bring.
But hark! upon the frosty winter air
The Christmas chimings ring,

And like a guilty ghost at breath of dawn,
My coward moanings fly;
Echoes again th' adoring song that woke
Beneath Judæa's sky.

And sweeter, clearer, louder, chime on chime,
Ring out, O happy bells!
For every peal, with jubilant refrain,
The wondrous tidings tells:—

The wondrous tidings, old yet ever new,
That hallow Christmas mirth,
For on the blessed day when Christ was born
Joy comes to all on earth.

O hearts so weary with the pain of life,
That fain your bleeding feet
Would seek the gates of death to stop and rest—
Lo! rest and comfort sweet.

And ye who lift your happy brows to heaven
Joy-crowned this Christmas day,
Still brighter beams your earthly bliss, aglow
With that celestial ray.

O Star, that lit the dreary dark of sin!
O Babe, that bade us live!—
O God, who, moved by pity and by love,
The precious Babe didst give!—

O Love divine! dear Babe! Almighty God!
What praises can we sing?
How shall our voices faint thy beauty tell,
Our Saviour, Brother, King!

The laughter of the happy children sounds;
They know not what they say;
They only feel they love us for the joy
We give them Christmas day.

And so, albeit we have no power to speak
The thoughts that in us move,
Dear Father, though we are so low, so weak,
We love Thee for thy love.

Louise Both-Hendriksen.

THE FOOD QUESTION IN AMERICA AND EUROPE;

OR THE PUBLIC VICTUALING DEPARTMENT.

IN the year 1865 the average production of grain to each inhabitant of the United States, man, woman, and child, was thirty-two and one-half bushels, consisting of Indian corn, wheat, oats, barley, rye, and buckwheat.

In the year 1885 the average product was fifty-two and one-half bushels, an increase of more than sixty per cent.

The gain in the production of hay, of meat, of dairy products, of fruit and other articles of food cannot be accurately measured, but has doubtless been equal to the *per capita* increase of grain.

If objection be taken that the agricultural statistics of 1865 were incomplete, because taken so soon after the war, reference may be

made to the average of the decade 1865 to 1874 inclusive, in which years the crop of grain averaged $37\frac{85}{100}$ bushels per head, as against the average of $48\frac{16}{100}$ bushels per head in the years 1875 to 1885—a gain of over twenty-seven per cent. *per capita*. The gain is really greater than is indicated by this percentage, because the proportion of our population which was engaged in agriculture was less in the second period than it was in the first.

In 1861 the railway service between the East and the West had for the first time become a unit, by the completion of various sections of railway connecting the whole system at many points. The importance of this fact in its connection with the power of the North to concentrate its armed forces, and to supply them with food during the civil war, has yet to be treated. It was an important factor in

the power of the North to maintain the integrity of the nation.

It was not until 1869 that the first consolidation took place of a through line under one management, from Chicago to the seaboard. This was then accomplished by the late Cornelius Vanderbilt.

In 1865 the average charge for moving a ton of produce from Chicago to the seaboard, and for moving general merchandise from the East to the West, was at the rate of three cents and forty-five hundredths per ton per mile. In 1885 it was sixty-eight hundredths of a cent for the same service.

If we take certain typical quantities of flour, beef, pork, corn, dairy products, and of fleece wool, weighing thirteen tons, their value at the market prices for export in the city of New York in the year 1865 was \$1,124.33, either for export or for domestic consumption, and they remained substantially at this value during the years 1866, '67, and '68—the period of paper inflation. The cost of moving thirteen tons one thousand miles over the New York Central Railroad and its connections in 1865 was \$448.63, leaving to the producer or his agent in Chicago the net sum of \$675.70 in paper money, equal to \$475.76 in gold. The same quantities of the same articles were worth in the city of New York in June, 1885, \$575.98 in gold. The cost of moving them a thousand miles was \$88.40, leaving to the producer or his agent \$487.58 in gold. But in the interval the efficiency of the farmer, measured by the increase in the grain crop *per capita*, had increased by sixty per cent., so that he could have placed twenty tons in New York in 1885, as against thirteen tons in 1865, the value of which, after deducting the freight, was \$780.13. These figures may explain facts which are of common observation. The old mortgage debts have all been paid, and the rate of interest on capital in the West now differs little from that in the East on the same security.

Thus it appears that, notwithstanding a reduction of price by one-half, the increased efficiency of the railway service and the restoration of the gold standard of value have enabled the farmer of the West to grow rich on the low price of produce, where he would have inevitably become poor under the former system of paper money, high prices, and heavy railway charges.

If we apply the rates at the two periods to flour, as an example of the average food of the people, at ten barrels per ton of 2000 pounds,—which is within a fraction of the true quantity,—the cost of moving a barrel of flour 1000 miles in 1865 was \$3.45. In 1885 it was 68 cents. The average ration of wheat-

flour to each adult person in the United States is well ascertained to be one barrel each year. Our population is now computed at somewhat over 58,000,000, or, if we rate two children of ten years old or under as one adult, we number in our consuming power 50,000,000 adults, each requiring one barrel of wheat-flour a year, all of which is moved on the average at least 1000 miles from the producer to the consumer. Before railways were constructed, grain which was 150 miles distant from a waterway could not be moved that distance without an expenditure about equal to its value. If wheat had been subject in 1885 to the charge of 1865, the cost of moving 50,000,000 barrels of flour 1000 miles would have been \$172,500,000. At the actual charge of 1885 over the New York Central line, at the average traffic charge of the year on all merchandise, of 68 cents, the cost was \$34,000,000, a difference of \$138,500,000 on the flour only.

Bread, however, is a less important factor in the subsistence of the people of this meat-consuming country than it is in other countries. In the Eastern and Middle States recent investigations of the Bureaus of Statistics of Labor—especially in Massachusetts—sustain the substantial accuracy of previous computations made by the writer from the accounts of factory boarding-houses as to the average standard daily ration, or cost and quantity of the daily supply of food materials of adults who are occupied in the actual work of every-day life as artisans, mechanics, factory operatives, or laborers. The average in the factory boarding-houses—the occupants being mostly adult women—comes to 24 cents a day. A fair average cost of food for men and women engaged in manufacturing and mechanical arts appears to be 25 cents a day, varying in some measure in respect to the proportions, as the dietary of men varies somewhat from that of women, workingmen consuming more animal food than the average of factory operatives, who are mostly women.

This daily ration consists of the following elements:

Meat (including poultry and fish, a half to one pound, according to kind and quantity) at an average cost of.....	10	cents
Milk (half pint to one pint), butter (1 to 1½ ounces), and a scrap of cheese....	5	"
Eggs (one every other day) at 12 cents a dozen.....	½	"
<hr/>		
Total cost of animal food.....	15½	cents
Bread (about ¾ of a pound).....	2½	"
Vegetables (green and dry).....	2-2½	"
Sugar and syrup.....	2	"
Tea and coffee.....	1	"
Fruit (green and dry).....	½	"
Salt, spices, ice, and sundries.....	1½-1	"
<hr/>		
Average cost of daily ration.....	25	cents

The proportions vary somewhat under different conditions, but they may be taken as a fair average standard ration for adult workmen and women.

In the West the prices of meat and grain are less; the prices of groceries somewhat higher; but, on the whole, the same quantity of food can be purchased at somewhat less cost. In the South the habits of the people—especially of the colored race—are very different. Dairy products are much less used, and with the negro corn-bread and bacon (hog and hominy) take the place of most other varieties of food. On the whole, however, the proportion of wheat-bread to the other elements of the daily ration may probably be established at the proportion of one-tenth of the whole ration. If we, then, save \$138,500,000 per year in the cost of transportation on our bread-bill only, do we save tenfold on our whole food supply? Is our food, on the average, moved a thousand miles, either by railway or by waterway? No exact reply can be given to this question. We find, however, that the tonnage which was moved over all the railways of the United States in the year 1883 represented, on the average, a fraction over seven tons to each inhabitant, man, woman, or child, moved an average distance of 110 miles. In 1884 this quantity was slightly reduced *per capita*, but the distance was a little greater. The charge for this service in 1884 was \$8.75 per head of the whole population. In 1885 the quantity was a little more, the average rate per ton a little less, and the gross charge per person was \$8.88. The largest single item of this traffic—probably one-half—consisted of food for man or beast. When to this is added merchandise moved by waterways and by wagon, and when consideration is given to the fact that all these materials must be sorted, converted, reconverted, and finally distributed in small parcels by wagon or by hand, so that every adult person may be sure to have from three to five pounds of solid food and one to two pounds of liquids, together with the necessary modicum of fuel, clothing, and shelter, the mere mechanism of subsistence can be comprehended, and the relative importance of the victualing department may be fully realized.

The average cost of the food materials in the Eastern and Middle States has been given. The people of these sections are even more dependent on the mechanism of distribution than any others. Their proportion of the railway tonnage must be double, in respect to distance, that of the inhabitants of other sections; and yet such is the perfection of the railway service at the present day that one day's wages of a common mechanic—or one

holiday in a year devoted to work—in Massachusetts will pay the cost of moving a year's supply of bread and meat from the prairies of the West to the center of Eastern manufactures. This fact cannot be too often repeated.

In view of these data, if the gain compassed in twenty years in the cost of moving bread alone has been \$138,500,000 for one year, how much do we now save on all the necessities of life? No absolute reply will be attempted; but it may be remembered that by way of the railway, waterway, and steamship the whole world has been converted into a neighborhood. Within the lives of very many men now living, each little area of this country practically depended upon its own labor for its own food. To-day the wheat of Oregon and of California is carried around Cape Horn to England at a fraction of its value, while half the people of Great Britain derive their food from India, Australia, and America, or from fields which are from six to thirteen thousand miles away. A cube of coal which would pass through the rim of a quarter of a dollar will drive a ton of food and its proportion of the steamship two miles upon its way from the producer to the consumer. The great hotels of New York run special railway cars for carrying eggs from Michigan to New York, and yet we import hens' eggs in considerable quantity from Denmark and from Holland. If each adult in the United States consumes one egg every other day, at only twelve cents a dozen, which is the proportion of the factory operatives of New England, the value of our hens' eggs is \$91,250,000 per year, or twice the value of the product of silver bullion, 25 per cent. more than the value of our wool-clip, and greater than the value of the entire product of our iron furnaces, even if we increase the product of pig-iron this year to 5,000,000 tons at \$17 a ton, at the furnace, or \$85,000,000 in the aggregate; at which figures our iron industry would greatly prosper.

I may venture to give once more a table which shows statistically the food-bill of the people of this country, upon the assumption that each average adult ought to enjoy as good a supply of food as the adult factory operatives, mechanics, and artisans of New England and the Middle States:

	Per day.	Aggregate per year.
Meat, fish, and poultry	10 cts.	\$825,000,000
Milk, butter, and cheese	5 "	912,500,000
Eggs (one every other day)	½ "	91,250,000
<hr/>		
Animal food	15½ cts.	\$2,828,750,000
Bread (¾ lb. per day)	2½ "	456,250,000
Vegetables	2½ "	456,250,000
Sugar and syrup	2 "	365,000,000
Tea and coffee	1 "	182,500,000

	Per day.	Aggregate per year.
<i>Amounts bro't forw'd</i>	23½ cts.	\$4,288,750,000
Fruit (green and dry)	½ cts.	91,250,000
Salt, spice, ice, and sundries	1 "	182,500,000
	25 cts.	\$4,562,500,000

Deduct probable excess on sugar, tea, coffee, and dairy products 262,500,000

\$4,300,000,000

Add spirits and fermented liquors at the average between the estimates of Mr. D. A. Wells and the advocates of prohibition, about 700,000,000

Probable price of food and drink constituting the victualing department for one year at the present time. \$5,000,000,000

These figures are, as to each separate item, greatly in excess of ordinary computations, very few persons ever daring to estimate the entire dairy product of the country at over two-thirds the sum which is given in this table. In explanation of this discrepancy, I may state that few persons comprehend the great cost of distributing food in small parcels at retail. Perhaps the most difficult problem in the victualing department is to reduce this element of the cost of food. For instance, in the foregoing dietary the estimate for bread is three-quarters of a pound per day, at a cost of two and a half cents, which would be at the rate of three and one-third cents per pound of bread, a quantity corresponding to the ration of one barrel of flour per year to each adult, each barrel yielding two hundred and eighty pounds of bread. Now, there is only one place within my knowledge where good bread can be purchased at so low a price as three and one-third cents per pound: that is in the shops of the Howe National Bakery in New York. In Boston I find the average price of bread which is sold in the bakers' and grocers' shops to be more than five cents per pound, at which price the larger portion of the population of this city is served. At five cents per pound the bread-bill of the people of the United States would come to \$700,000,000, in place of \$456,250,000. It therefore follows that if the food-bill of the people is not in quantity what this standard calls for, the reason is that the average dietary is not up to this standard, even after making the admitted deduction for the excess of tea, coffee, sugar, and dairy products which is consumed in the East, as compared to other parts of the country.

In order that some idea may be gained as to the accuracy of the proportions which are given in this dietary, I have been enabled, by the courtesy of Mr. McHugh, Chief of the Bureau of Labor Statistics in Ohio, to give the average cost of the daily rations of the inmates

of the insane asylums and of the reformatory institutions of Ohio. It is as follows:

Meat (including fish and poultry)	cents 6.40
Milk, butter, and cheese	" 3.30
Eggs	" .30

Animal food " 10.00

Sugar, syrup, salt, spice, and other groceries (including beans and lard) " 2.50

Bread " 2.10

Vegetables and fruit (green and dry) " 2.00

Tea and coffee " .60

Total per day " 17.20

Number of persons subsisted for one year . . 6256

Many other comparisons might be made from the excellent reports of other bureaus; but this will suffice to establish the proportions of the victualing department.

It is admitted that the ration of sugar, tea, coffee, and dairy products in the previous table is too high; but if, after making deductions for these elements of subsistence, the price of whisky and beer be added at the average between the lowest computation of the skilled economist, Mr. David A. Wells, say about \$500,000,000, and the estimate of prohibition advocates, \$900,000,000, there can be no question that the total cost of food of the people of the United States is \$5,000,000,000; and at this estimate it doubtless represents one-half the price of life measured in money to at least ninety per cent. of the population who do the actual physical work of the whole community.

It is a well-established fact that, with respect to the more thrifty and prosperous classes of mechanics, artisans, and other so-called working classes, as well as in regard to the larger proportion of salaried classes, one-half the cost of living is the price of materials for food. As we go down in the grade of work to the level of the common laborer, who can earn but from 80 cents to \$1.25 per day, the proportionate cost of food materials rises to 60 and even 70 per cent. of the income of the family.

Thus it appears that, notwithstanding the improvement in the mechanism of distribution, and in spite of the enormous increase in the *per capita* product of grain and other food, great numbers of persons, even in this country, can barely obtain their daily bread, while want exists in the midst of plenty. Why is this? Is it not because we waste enough in ignorant buying and in bad cooking to sustain another nation as numerous, and because no common attention has yet been given to what may be called the Art of Nutrition? The writer only ventures to refer to this art in anticipation of a series of articles upon the

Science of Food, which are to be given in future numbers of THE CENTURY by Professor W. O. Atwater, to which this article may serve as an introduction.

It is important to determine the causes of these false conditions in the United States. More difficult yet are the problems in such countries as Ireland and Egypt, each name representing one of the most productive areas of the earth's surface, capable of sustaining a greater population than exists in almost any other country in proportion to area, and yet both stricken with poverty, almost with famine. Why are fertile districts of northern Italy devastated by the *pellagra*, a loathsome disease which is induced by insufficient nutrition? Why has the Government of Germany undertaken to instruct the people in the art of nutrition, lest the sordid condition of great districts should end in socialism, nihilism, and violent revolution? What is the most important department in the political questions of Europe to-day? Is it not the Victualing Department?

It must be remembered that, in the nature of things, there must be a substantial equality in the daily supply of food, so far as weight and the elements of nutrition are concerned. If the masses of the people are to be well nourished, each adult person must have the due proportion of protein or nitrogenous material, of fats, and of carbohydrates or starchy materials, because if either one is deficient vital force cannot be sustained. Neither can there be any true mental vigor or spiritual life when the body is not well nourished. "*Non est animus cui non est corpus.*" So far as any disparity can be admitted, the workingman or common laborer requires more than any one else. His food is his fuel, and his physical exertion must be sustained by a sufficient supply with the same regularity and certainty that the boiler of the steam-engine must be fed with coal; and, in fact, it will appear in Professor Atwater's future treatment of this subject that, although the standard rations which have been established as necessary to sustain a workingman in full vigor by several leading authorities in Germany, France, and England vary somewhat in the relative proportions of protein, fats, and carbohydrates, yet when reduced to calories, or mechanical units, or equivalents of heat, they correspond almost exactly each to the other. He will also show that it has been found expedient for the employers of labor in certain brickyards of Massachusetts and Connecticut to serve their workmen with a supply of the best food which represents in its chemical proportions, as well as in its calories, twice the ration which is served to the soldier of the German army when upon a forced march, or when engaged in the most arduous struggle

of active service in war, in order to promote the largest production of brick per man at the lowest cost to the employer.

The actual production of the principal element of food in the United States, to wit, the grain crop, has been given. Attention has also been called to the perfection to which the mechanism of distribution has been brought.

A few words may now be given to the use of land—the source of nearly all our food. The arable portion of the United States is computed at more than one-half the total area of 3,000,000 square miles, omitting Alaska. Of this portion only 265,500 square miles are yet put to actual use in the production of grain, hay, roots, or other articles of food, omitting only that proportion of animal food which beasts derive from pastures. The several areas of arable, pasture, and mountain land are given below, and in the portion set off as pasture-land are given the areas which might suffice for a much larger production of beef, dairy products, mutton, and wool than we now enjoy, if known methods of agriculture were intelligently applied to these arts.

In the accompanying diagram the outer square indicates the total area of this country, omitting Alaska, substantially 3,000,000 square miles. This square has been subdivided into three parts. The upper half or section represents, in a rough-and-ready way, the arable land of the country. What is called arable land really constitutes a larger portion, but one-half at least may be called fairly good land.*

The lower half is divided into two sections. One of these sections fairly represents pasture or grazing land, too dry for agriculture without irrigation, but capable of sustaining great flocks and herds. The other portion is assigned to mountain and timber. But even this part has many fertile valleys, and much of it may be made use of for the production of food.

Within the lines of the upper half, certain proportions drawn on the same scale as the outer square, which represents the total area, will be observed. These smaller sections represent proportionately the actual cultivation, as it now is, in its ratio to the whole.

CORN AND PORK.

OUR average crop of Indian corn ranges from 1,800,000,000 to 2,000,000,000 bushels. At twenty-five to thirty bushels to the acre, the area of the corn-field is only 112,500 square miles, or less than four per cent. of the total area of the country. Our customary average

* The following analysis of the use of land has been previously submitted in "Bradstreet's" by the writer.

OUR NATIONAL DOMAIN.

WHAT WE HAVE DONE WITH IT, AND WHAT WE MIGHT DO WITH IT.

SECTION 1. ARABLE LAND—1,500,000 SQUARE MILES.	
IN ACTUAL USE.	
Corn and Pork. 1,900,000,000 bushels. 112,500 sq. miles.	Wheat. 500,000,000 bushels. 60,000 sq. miles.
	Hay. 40,000,000 tons. 50,000 sq. miles.
	Oats. 550,000,000 bushels. 30,000 sq. miles.
	Cotton.
	Miscellaneous.
302,500 square miles now produce all our grain, hay, cotton, sugar, rice, and garden vegetables.	
SECTION 2. PASTURE-LAND.	
WHAT MIGHT SUFFICE.	
Beef. 60,000 square miles.	Dairy. 60,000 square miles.
	Sheep. 60,000 square miles.
(A square mile = 640 acres.)	
SECTION 3.	
MOUNTAIN AND TIMBER.	

Compiled from the records of the Agricultural Department and other sources.

is less than thirty bushels, but on the best land fifty bushels are commonly produced, and sometimes one hundred. Corn may be reduced to pork at the ratio of about one bushel to ten pounds, including waste.

WHEAT.

ABOUT 60,000 square miles are all that are required or are now under cultivation in wheat. At only thirteen bushels to the acre, this little patch, constituting but two per cent. of our total area, would yield 500,000,000 bushels of wheat. This quantity, after setting aside enough for seed, would supply 80,000,000 people with their customary average of one barrel of flour per year.

HAY.

A HAY crop of 40,000,000 tons, at the average of a good season, one and a quarter tons per acre, calls for less than two per cent., or 50,000 square miles.

OATS.

THE oat crop of between 500,000,000 and 600,000,000 bushels, at thirty bushels to the acre, calls for one per cent., or 30,000 square miles.

COTTON.

WHILE the cotton crop has never reached 20,000 square miles, or two-thirds of one per cent. of the entire area of the country (less than two and a half per cent. of the area of the strictly cotton States), yet on this little patch, at the beggarly crop of one-half to three-fifths of a bale to the acre, 6,000,000 to 7,000,000 bales can be made each year.

MISCELLANEOUS.

LASTLY, all our miscellaneous crops of barley, hay, potatoes and other roots, of rice, sugar, tobacco, hemp, and garden vegetables, are raised on one per cent. of our area, or 30,000 square miles.

POSSIBILITIES.

It is perfectly safe to affirm that were a reasonably skillful mode of agriculture generally applied to these crops, the area now under cultivation would yield all that could be required by double the present population of the United States, and would yet leave over as much as we now export.

In the square which has been set aside to represent pasture-land certain subdivisions have been made which represent what *might* be done with the land, not what *is* done with it. Our cattle truly roam over a thousand hills and over wide plains, under the worst possible conditions for the best production of meat, or even of dairy products. When an intelligent and an intensive system of farming shall have been adopted, and when each one of the Eastern States (with the possible exception of Delaware and Rhode Island) shall produce within its own limits all its own meat and its own dairy products (as may soon happen), the area set off for beef, dairy, mutton, and wool will more than suffice.

BEEF.

THE area assigned to beef is 60,000 square miles. This would yield each year one two-year-old steer to every two acres. It is now admitted, as has been frequently proved, that sufficient green fodder can be made and saved in pits, under the name of ensilage, to carry two steers to one acre. The additional nutriment — meal from Indian corn, cottonseed meal, or hay — has been already provided for in the area set off for these crops. At the rate of one two-year-old steer taken off each two acres, each adult inhabitant of the United States, counting two children of ten years or under as one adult, could be served with very nearly one pound of dressed beef per day.

DAIRIES.

THE area set aside for dairy products is also 60,000 square miles. At the ratio of one cow to each two acres, fed on ensilage, cottonseed meal, and a modicum of hay, there would be a yield of fifty per cent. more milk, butter, and cheese than the people of the United States now enjoy; while the eggs, valued at the present time at not less than \$90,000,000 a year, and probably at \$120,000,000, could also be doubled in the same area.

MUTTON AND WOOL.

To a similar area of 60,000 square miles mutton and wool are assigned. Were sheep folded and fed as they are in England and in

some parts of this country, protected from cur dogs and properly nourished, wool to the amount of 500,000,000 pounds a year (which is more than our present entire production and import) could be readily produced from this little patch, together with a greater secondary product of mutton and lamb than we now consume.

CONCLUSIONS.

It may therefore be inferred that, for the present at least, there will be no danger of starvation within the limits of this country, or of the exhaustion of our land. No one yet knows the productive capacity of a single acre of land anywhere. When land is treated as a laboratory and not as a mine, subsistence may become more of a science than it now is, and neither prosperity nor adversity may then be attributed either to abundance or to lack of land.

In this connection it may be well to say that the distribution of the farm-lands of the United States is one of the most important factors in the social order. In 1880 the census disclosed the following facts:

Total number of farms.....	4,008,907
Cultivated by owners.....	2,984,306
Rented on shares.....	702,244
Rented for money payments.....	322,357
Average size of farm, acres.....	134
Farms of 50 acres or less.....	1,175,564
Farms over 50 and not exceeding 500 acres.....	2,728,973
Farms of over 500 acres.....	104,550

From these facts it may appear that if there is want in the midst of plenty in our own land, and if there is any difficulty in procuring daily food, it may not be attributed either to lack of land, want of capital, or scarcity of laborers. The modern miracle of the loaves is this: One man working the equivalent of three hundred days in the year, or three men working one hundred days in the harvest season on the far plains of Dakota in the production of wheat, aided by one man working three hundred days in milling and barreling the flour, and supplemented by two men working three hundred days in moving wheat and flour from Dakota to New York, and in keeping all the mechanism of the farm, the mill, and the railroad in good repair — four men's work for one year places one thousand barrels of flour at the mouth of the baker's oven in the city of New York — a yearly ration of bread for one thousand men and women.

What, then, is needed in order that all alike may have their necessary equal share of food — their three to five pounds per day of grain, meat, vegetables, and products of the dairy, and the like? Is it not a knowledge of the alphabet of food? Is not the missing factor

in our material welfare to-day the want of a common knowledge of what food to buy, and how to cook it? Half the mere price of life in money is the price of food. If we add to this the household labor in its proportion, the measure of the cost of food in terms of labor is far more than half the work of life. How many eight- and ten-hour men have fourteen-hour wives, whose work is toilsome and continuous, day in and day out, almost night and day, for the support of their families!

Although the food question is one of grave importance, even in this country, there can be with us no possible scarcity of food. Nearly one-fifth part of the products of agriculture (including cotton) is exported to feed and clothe the people of other lands. In return for these exports — the grain which we could not consume, and the cotton which we could not spin, and the oil which we could not burn, because there is enough and to spare besides what we export — we receive our great volume of imports, which has been divided into the following proportions by the measure of value in money, according to the average of recent years:

Articles of food and live animals.....	\$200,000,000
Articles in a crude condition, which are necessary in the processes of domestic industry.....	160,000,000
Articles fully or in part manufactured, which are used in the domestic arts or manufactures.....	75,000,000
Total.....	\$435,000,000
Manufactured goods ready for final consumption.....	\$130,000,000
Articles of voluntary use which may be classed as luxuries.....	65,000,000
	195,000,000
Total.....	\$630,000,000

The proportion of the product of agriculture exported varies year by year. If the declared value of exports be compared with the valuation of all crops at the farms, it ranges from twenty to twenty-five per cent. A fairer comparison is to extend the farm values to the final values at wholesale in the principal markets. The writer applied this method to the census figures of 1880 with the aid of other experts. The conclusion was that the wholesale value of all crops at the centers of wholesale distribution in the census year was a little less than \$4,000,000,000. Of this quantity somewhat

over \$700,000,000 worth was exported, or over seventeen per cent.; the proportion is now less.

In the production and movement of the crops to the centers of distribution 8,000,000 men were occupied, of whom seventeen per cent. or more, say 1,360,000, depended on a foreign market. In return we received imports classified as above, of which more than two-thirds consisted of articles of necessity or common comfort. It is in this way that the interdependence of nations asserts itself in spite of the obstructions of time, distance, and taxes, and that in all true commerce men and nations serve each other, both parties making a gain in every exchange of product for product.

The enormous export demand, especially of European countries, upon us for food, which is brought into notice by the fact of our large exports, brings into conspicuous observation the urgency of the demands of the victualing department, especially upon the continent of Europe; while the simple fact that several European states have obstructed the import of provisions from this country by heavy duties, or have absolutely prohibited the import of our pork upon the false pretense that it is especially unwholesome, bears witness also that, although the wages of labor in these countries are very low, yet the cost of the production of food, as measured by labor or in money, is very high. Where the product of agriculture is relatively small in proportion to the population and to the demand or purchasing power, it follows of necessity that the wages of labor must be very low, and the subsistence of the people inadequate. Only one or two examples can be given within the limits of this article.

I am permitted to give the following data, which have been furnished me by one of the most intelligent official observers in Germany, Consul J. S. Potter of Crefeld, Germany, in a report on the condition of German agriculture.* From this report I find that the income of a Prussian farm laborer, employed as a first hand upon a large farm, whose family consisted of himself, his wife, and five children, all under thirteen years old, averaged as follows in a recent year:

Wages of husband.....	\$142.80
Wages of wife in harvest time.....	11.90
Value of pork and potatoes raised and consumed.....	47.60
Value of goat's milk and vegetables sold....	26.18
Total income.....	\$228.48

* These reports and others of equal value have since been published among the consular reports issued by the State Department. Attention may well be called to these reports. At the request of the Secretary of State, the representatives of the great industries of the country prepared very careful forms of interrogatory

in respect to the several arts on which reports were desired, including agriculture. Responses to these questions thus prepared by experts are now being published, so that the reports of such consuls as have the capacity to report facts are becoming of great value to the student of social science.

EXPENSES.

Wheat-bread.....	\$ 7.14
Rye black bread.....	24.75
Pork and potatoes (valued as before).....	47.60
Cheese.....	4.95
Syrup.....	5.00
Coffee.....	3.71
Salt, pepper, and sundries.....	1.24

Total food for seven persons for one year \$94.39

This makes a cost of three cents and seven-tenths per day per person. If the five children under thirteen be computed as two and one-half adults, making the family equal to four and one-half adults, the average per day is only five and three-quarter cents.

In my investigations of the food question I have found no statement of the food supply of a thrifty workingman and his family so meager as this, or at so low a cost *per capita*.

It may be interesting to give the other items of expenditure of this thrifty German peasant:

Clothing.....	\$39.97
Rent of house and three-quarters of an acre of land.....	35.75
Fuel and lights.....	14.24
Oil, soap, etc.....	3.71
Meal for goat and pig.....	16.66
Beer and tobacco.....	7.14
Sundries.....	14.28

Making a total expenditure for a family of seven persons..... \$226.14

In this same neighborhood, which is one of the most fertile parts of Prussia, the wages of other farm laborers who are supplied with food by their employers are as follows:

First laborer per year, \$71.50 with board.	
Second " " " 39.25 " "	
Third " " " 26.18 " "	

Average wages per year, \$44.25, or less than \$4 per month with board.

But when we turn to the production of a first-class Prussian farm and its cost, we find the product of a fraction less than ninety-one acres of land, which had been cultivated in a most skillful and intelligent manner, valued in all at \$3,942.47. Part of this product consisted of wheat, the cost of which is given at eighty-four cents per bushel of sixty pounds. Another portion consisted of rye, the cost of which is computed at sixty-eight cents per bushel of fifty-eight pounds.

It will be observed that although the wages of the farm laborer in this section average less than four dollars a month, with board added, the money cost of a bushel of wheat is set at eighty-four cents. In our great wheat-producing States and territories of the Far West wages are four- to five-fold, with board, and yet the cost

of a bushel of wheat in some places is not over one-half, or forty-two cents a bushel. It may be alleged that this is because we are converting the original fertility of a virgin soil into wheat, and thereby exhausting the land; but the rule holds true in only a little different proportion in the wheat-producing counties of New York and Pennsylvania, where fertilizers are as much required as in Germany. Wages in these sections are as high as those in the Far West, while the cost of wheat in money is not over two-thirds of that given as the cost in Germany at the farm.

It is interesting to consider the dietary of this prosperous Prussian farmer. The food is nearly one-half black bread made of rye. The proportion of meat is very small, as compared with the rations of this country. His family consisted of nine persons, three being children of over fourteen years of age. Their total living expenses for the year were \$736.28, divided as follows:

Food.....	\$300.41
Clothing.....	119.00
Fuel and light.....	23.89
Beer, wine, and spirits.....	71.40
Cigars, tobacco, and entertainments.....	47.60
Sundries.....	29.75
School expenses, and maintenance of son in army.....	144.23
Total.....	\$736.28

The cost of food per person each day is nine and a quarter cents.*

It is singular to compare the school expenses, the support of the son in the army, and the beer, wine, and spirits with the food bill. The food supply of this farmer, whose book accounts appear to have been kept with the accuracy of a merchant, and whose method of cultivation, as described, might serve as a lesson anywhere in scientific agriculture, is less in quantity and variety, and less in cost by at least one-third, as compared with the rations which are served in the prisons of Massachusetts.

The significant item in this expense account is the maintenance of the son in the army.

There are, of course, many other causes, aside from the military system of Europe, for the differences which are to be found in the subsistence of the people, which cannot be treated in the limits of this article. For instance, the relative area and population of European states, aside from Russia and Turkey, enter into the consideration. The area is about one-half that of the United States, while the population is little more than eight-

* For further comparisons of the food supply of working people in different countries, reference may be made to the first report of the National Bureau of the Statistics of Labor, by Hon. Carroll D. Wright.

fold, the ratio to the square mile being a little less than twenty in this country and one hundred and sixty in Europe.

This area is divided into fifteen empires, kingdoms, or states, omitting the petty states of eastern Europe, which are separated from each other by differences of race, creed, and language. Their commerce is obstructed among themselves by as many different systems of duties upon imports as there are states. The natural outlet for the crowded population of central Europe might be in southern Russia and in the fertile sections of Asiatic Turkey, were the relations of these several states to the eastern country the same as those of the Eastern States of this country to those of the West. There is land enough, and to spare; but the armies of Europe are sustained in order to prevent this very expansion of the people; and the misgovernment of the Turk, which renders Asia Minor almost a howling wilderness, is protected by the mutual jealousies of these very states, which are thus being destroyed by their own standing armies.

As war becomes more scientific, it becomes more costly. Victory rests not only on powder and iron, but yet more on bread and beef. It may have been the German sausage by which France was beaten, quite as much as the German rifle.

The food question in Europe may be one of possible revolution and repudiation of national debts, and of the disruption of nations as they now exist; and to this branch of the victualing department attention may well be called, because its conditions are so greatly in contrast to those of the United States; but this phase of the question will be treated separately in a subsequent article. May we not find in these costly armies, excessive debts, and excessive taxes not only the cause of pauper wages, but also the cause of the ineffectual and costly quality of so-called "pauper labor"? May there not also be found in these figures the incentives to socialism, to communism, and to anarchy? What hope for men and women, the whole of whose product would barely suffice for subsistence, when ten, twenty, and perhaps even thirty per cent. is diverted from their own use, and even food is denied them sufficient to maintain health and strength, in order that these great armies may be sustained?

The victualing department is therefore presented in these three phases:

First. In our own country the only question is how to save the waste of our abundance, and how to teach not only the working people, but even the prosperous, the right methods of obtaining a good and wholesome subsistence at less cost in money than they now spend for a poor and dyspeptic one.

Second. In Great Britain and Ireland the victualing department underlies a system of land tenure which is now on its trial, and which has led to such artificial conditions that great areas of good land have been thrown entirely out of cultivation, while half the people are being fed from fields from five thousand to fifteen thousand miles distant.

Third. Upon the continent of Europe the victualing department stands face to face with a forced method of distributing and wasting a food-product which, as a whole, is insufficient to maintain the whole population in vigor and health even if it were evenly distributed, as food must be equally distributed by weight if not by quality, in order that men and women may be equally well nourished.

When a famished democracy becomes conscious of its power, what will be the end of privileges which are not founded on rights, and of national debts which have been incurred by dynasties without the consent of the people who are now oppressed by them? How will standing armies be disbanded, which now seem to be as incapable of being sustained as they are impossible of being disarmed?

Such are some of the appalling questions to which we are led when we attempt to analyze the way in which men, women, and children now obtain the modicum of meat and bread which they must have every day in order to exist, and that daily ration of dairy products, of fruit, of sugar, and of spice which is needed for common comfort.

There is but one element of life which all have in common, and that is Time. Who can teach us how to use our time so as to obtain the substantially even weight of food which is necessary to the adequate nutrition and to the common welfare of rich and poor alike?

The writer can only put these questions, and report the facts and figures which he has given. Some of them may be already familiar to the readers of *THE CENTURY*; but their true significance he himself hardly comprehended until they had been grouped together under the title of "The Food Question."

Edward Atkinson.

The Hand of Lincoln.

Look on this cast and know the hand
That bore a nation in its hold;
From this mute witness understand
What Lincoln was — how large of mould
The man who sped the woodman's team,
And deeper sunk the ploughman's share,
And pushed the laden raft astream,
Of fate before him unaware.

x x x x x
Lo, as I gaze, the statured man,
Built up from your large hand, appears:
A type that Nature wills to plan
But once in all a people's years.

What better than this voiceless cast
To tell of such a one as he,
Since through its living semblance passed
The thought that bade a race be free!

R. COLLINS del.

ABRAHAM LINCOLN : A HISTORY.*

BY JOHN G. NICOLAY AND JOHN HAY, PRIVATE SECRETARIES TO THE PRESIDENT.

LINCOLN AS SOLDIER, SURVEYOR, AND POLITICIAN.

NEW SALEM CONTINUED.—THE VOYAGE OF
THE *TALISMAN*.

We have anticipated a score of years in speaking of Mr. Lincoln's relations to his family. It was in August of the year 1831 that he finally left his father's roof, and

swung out for himself into the current of the world to make his fortune in his own way. He went down to New Salem again to assist Offutt in the business that lively speculator thought of establishing there. He was more punctual than either his employer or the merchandise, and met with the usual reward of punctuality in being forced to waste his time in waiting for the tardy ones. He seemed to the New Salem people to be "loafing";

† Mrs. Lizzie H. Bell writes of this incident: "My father, Menton Graham, was on that day, as usual, appointed to be a clerk, and Mr. McNamee, who was to be the other, was sick and failed to come. They were looking around for a man to fill his place when my father noticed Mr. Lincoln and asked if he could write. He answered that 'he could make a few rabbit tracks.'"

several of them have given that description of him. He did one day's work, acting as clerk of a local election, a lettered loafer being pretty sure of employment on such an occasion.† He

RUTLEDGE'S DAM AND MILL, NEW SALEM, ILLINOIS.

also piloted a boat down the Sangamon for one Dr. Nelson, who had had enough of New Salem and wanted to go to Texas. This was probably a task not requiring much pilot-craft, as the river was much swollen, and navigators had in most places two or three miles of channel to count upon. But Offutt and his goods

He said that Abe knew more than any man in the United States; and he was certainly not warranted in making such an assertion, as his own knowledge of the actual state of science in America could not have been exhaustive. He also said that Abe could beat any man in the county running, jumping, or

CABIN ON GOOSE-NEST PRAIRIE, NEAR FARMINGTON, ILLINOIS, WHERE THOMAS LINCOLN LIVED AND DIED.

arrived at last, and Lincoln and he got them immediately into position, and opened their doors to what commerce could be found in New Salem. There was clearly not enough to satisfy the volatile mind of Mr. Offutt, for he soon bought Cameron's mill at the historic dam, and made Abraham superintendent also of that branch of the business.

It is to be surmised that Offutt never inspired his neighbors and customers with any deep regard for his solidity of character. One of them says of him, with injurious pleonasm, that he "talked too much with his mouth." A natural consequence of his excessive fluency was soon to be made disagreeably evident to his clerk. He admired Abraham beyond measure, and praised him beyond prudence.

"wrestling." This proposition, being less abstract in its nature, was more readily grasped by the local mind, and was not likely to pass unchallenged.

Public opinion at New Salem was formed by a crowd of ruffianly young fellows who were called the "Clary's Grove Boys." Once or twice a week they descended upon the village and passed the day in drinking, fighting, and brutal horse-play. If a stranger appeared in the place, he was likely to suffer a rude initiation into the social life of New Salem at the hands of these jovial savages. Sometimes he was nailed up in a hogshead and rolled down hill; sometimes he was insulted into a fight and then mauled black and blue; for despite their pretensions to chivalry they had no

MENTON GRAHAM. (FROM A DAGUERRETYPE IN POSSESSION OF HIS DAUGHTER, MRS. LIZZIE H. BELL.)

scruples about fair play or any such superstitions of civilization. At first they did not seem inclined to molest young Lincoln. His appearance did not invite insolence; his reputation for strength and activity was a greater protection to him than his inoffensive good-nature. But the loud admiration of Offutt gave them umbrage. It led to dispute, contradictions, and finally to a formal banter to a wrestling-match. Lincoln was greatly averse to all this "wooling and pulling," as he called it. But Offutt's indiscretion had made it necessary for him to show his mettle. Jack Armstrong, the leading bully of the gang, was selected to

from any he had heretofore engaged with. Seeing he could not manage the tall stranger, his friends swarmed in, and by kicking and tripping nearly succeeded in getting Lincoln down. At this, as has been said of another hero, "the spirit of Odin entered into him," and putting forth his whole strength, he held the pride of Clary's Grove in his arms like a child, and almost choked the exuberant life out of him. For a moment a general fight seemed inevitable; but Lincoln, standing undismayed with his back to the wall, looked so formidable in his defiance that an honest admiration took the place of momentary fury, and his initiation was over. As to Armstrong, he was Lincoln's friend and sworn brother as soon as he recovered the use of his larynx, and the bond thus strangely created lasted through life. Lincoln had no further occasion to fight his own battle while Armstrong was there to act as his champion. The two friends, although so widely different, were helpful to each other afterwards in many ways, and Lincoln made ample amends for the liberty his hands had taken with Jack's throat, by saving, in a memorable trial, his son's neck from the halter.

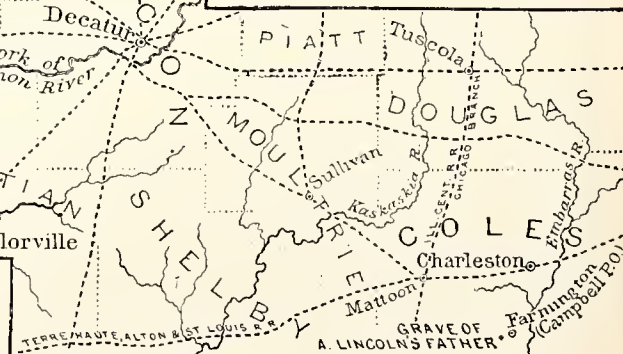

This incident, trivial and vulgar as it may seem, was of great importance in Lincoln's life. His behavior in this ignoble scuffle did the work of years for him, in giving him the position he required in the community where his lot was cast. He became from that moment, in a certain sense, a personage, with a name and standing of his own. The verdict of Clary's Grove was unanimous that he was "the cleverest fellow that had ever broke into the settlement." He did not have to be constantly scuffling to guard his self-respect, and at the same time he gained the good-will of the better sort by his evident peaceableness and integrity.

He made on the whole a satisfactory clerk for Mr. Offutt, though his downright honesty must have seemed occasionally as eccentric in that position as afterwards it did to his

MAP OF NEW SALEM AND VICINITY.

throw him, and expected an easy victory. But he soon found himself in different hands

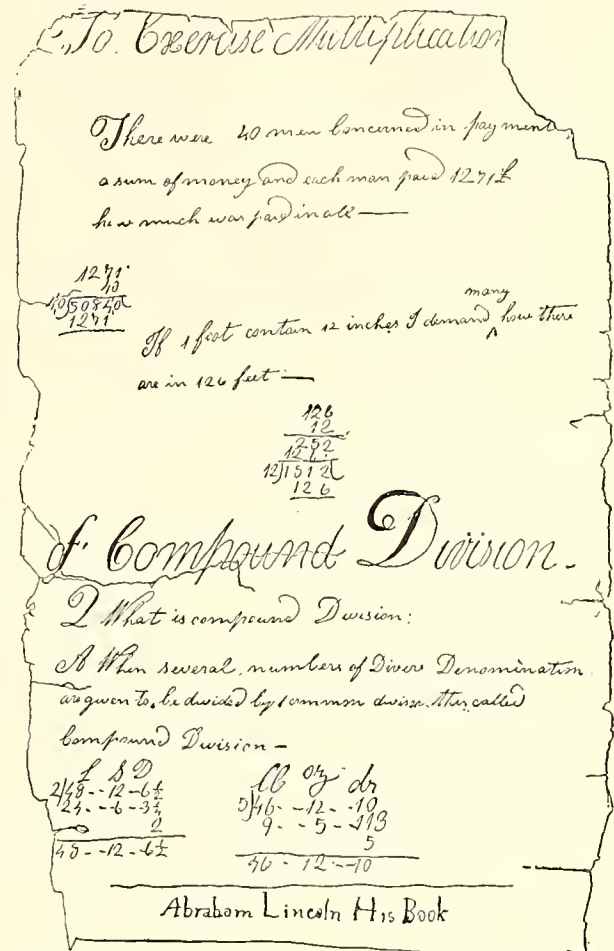

associates at the bar. Dr. Holland has preserved one or two incidents of this kind, which have their value. Once, after he had sold a woman a little bill of goods and received the money, he found on looking over the account again that she had given him six and a quarter cents too much. The money burned in his hands until he locked the shop and started on a walk of several miles in the night to make restitution before he slept. On another occasion, after weighing and delivering a pound of tea, he found a small weight on the scales. He immediately weighed out the quantity of tea of which he had innocently defrauded his customer and went in search of her, his sensitive conscience not permitting any delay. To show that the young merchant was not too good for this world, the same writer gives an incident of his shop-keeping experience of a different character. A rural bully having made himself especially offensive one day, when women were present, by loud profanity, Lincoln requested him to be silent. This was of course a cause of war, and the young clerk was forced to follow the incensed ruffian into the street, where the combat was of short duration. Lincoln threw him at once to the ground, and gathering a handful of the dog-fennel with which the roadside was plentifully bordered, he rubbed the ruffian's face and eyes with it until he howled for mercy. He did not howl in vain, for the placable giant, when his discipline was finished, brought water to bathe the culprit's smarting face, and doubtless improved the occasion with quaint admonition.

A few passages at arms of this sort gave Abraham a redoubtable reputation in the neighborhood. But the principal use he made of his strength and his prestige was in the capacity of peacemaker, an office which soon devolved upon him by general consent. Whenever old feuds blossomed into fights by Offutt's door, or the chivalry of Clary's Grove attempted in its energetic way to take the conceit out of some stranger, or a canine duel spread contagion of battle among the masters of the beasts, Lincoln usually appeared upon the scene, and with a judicious mixture of force and reason and invincible good-nature restored peace.

While working with Offutt his mind was turned in the direction of English grammar. From what he had heard of it he thought it a matter within his grasp, if he could once fall in with the requisite machinery. Consulting with Menton* Graham, the schoolmaster, in

regard to it, and learning the whereabouts of a vagrant "Kirkham's Grammar," he set off at once and soon returned from a walk of a dozen miles with the coveted prize. He devoted himself to the new study with that peculiar intensity of application which always remained his most valuable faculty, and soon knew all that can be known about it from rules. He seemed surprised, as others have been, at the meager dimensions of the science he had acquired and the ease with which it yielded all there was of it to the student. But it seemed no slight achievement to the New Salemites,

LEAF REDUCED IN SIZE FROM ABRAHAM LINCOLN'S EXERCISE BOOK, WRITTEN ABOUT HIS SEVENTEENTH YEAR. PRESENTED BY WILLIAM H. HERNDON, ESQ., TO KEYES LINCOLN MEMORIAL COLLECTION.

and contributed not a little to the impression prevalent of his learning.

His name is prominently connected with an event which just at this time caused an excitement and interest in Salem and the neighboring towns entirely out of proportion to its importance. It was one of the articles of faith of most of the settlers on the banks of the Sangamon River that it was a navigable stream, and the local politicians found that they could in no way more easily hit the fancy of their hearers than by discussing this assumed fact, and the logical corollary derived from it, that it was the duty of the State or the nation to

* This name has been always written in Illinois "Minter," but a letter from Mr. Graham's daughter, Mrs. Bell, says that her father's name is as given in the text.

GRAVE OF THOMAS LINCOLN, NEAR FARMINGTON, ILLINOIS.

clear out the snags and give free course to the commerce which was waiting for an opportunity to pour along this natural highway. At last one Captain Vincent Bogue, of Springfield, determined to show that the thing could be done by doing it. The first promise of the great enterprise appears in the "Sangamon Journal" of January 26, 1832, in a letter from the Captain, at Cincinnati, saying he would ascend the Sangamon by steam on the breaking up of the ice. He asked that he might be met at the mouth of the river by ten or twelve men, having axes with long handles, to cut away the overhanging branches of the trees on the banks. From this moment there was great excitement,—public meetings, appointment of committees, appeals for subscriptions, and a scattering fire of advertisements of goods and freight to be bargained for,—which sustained the prevailing interest. It was a day of hope and promise when the advertisement reached Springfield from Cincinnati that "the splendid upper-cabin steamer *Talisman*" would positively start for the Sangamon on a given day. As the paper containing this joyous intelligence also complained that no mail had reached Springfield from the east for three weeks, it is easy to understand the desire for more rapid and regular communications. From week to week the progress of the *Talisman*, impeded by bad weather and floating ice, was faithfully recorded, until at last the party with long-handled axes went down to Beardstown to welcome her. It is needless to state that

Lincoln was one of the party. His standing as a scientific citizen of New Salem would have been enough to insure his selection even if he had not been known as a bold navigator. He piloted the *Talisman* safely through the windings of the Sangamon, and Springfield gave itself up to extravagant gayety on the event that proved she "could no longer be considered an inland town." Captain Bogue announced "fresh and seasonable goods just received per steamboat *Talisman*," and the local poets illuminated the columns of the "Journal" with odes on her advent. The joy was short-lived. The *Talisman* met the natural fate of steamboats a few months later, being burned at the St. Louis wharf. Neither State nor nation has ever removed the snags from the Sangamon, and no subsequent navigator of its waters has been found to eclipse the fame of those earliest ones.

LINCOLN IN THE BLACK HAWK WAR.

A NEW period in the life of Lincoln begins with the summer of 1832. He then obtained his first public recognition, and entered upon the course of life which was to lead him to a position of prominence and great usefulness.

The business of Offutt had gone to pieces, and his clerk was out of employment, when Governor Reynolds issued his call for volunteers to move the tribe of Black Hawk across the Mississippi. For several years the raids of the old Sac chieftain upon that portion of his patrimony which he had ceded to the United States had kept the settlers in the neighborhood of Rock Island in terror, and menaced the peace of the frontier. In the spring of 1831 he came over to the east side of the river with a considerable band of warriors, having been encouraged by secret promises of coöperation from several other tribes. These failed him, however, when the time of trial arrived, and an improvised force of State volunteers, assisted by General Gaines and his detachment, had little difficulty in compelling the Indians to recross the Mississippi, and to enter into a solemn treaty on the 30th of June by which the former treaties were ratified and Black Hawk and his leading warriors bound themselves never again to set foot on the east side of the river, without express permission from the President or the Governor of Illinois.

But Black Hawk was too old a savage to learn respect for treaties or resignation under fancied wrongs. He was already approaching the allotted term of life. He had been king of his nation for more than forty years. He had scalped his first enemy when scarcely more than a child, having painted on his blanket the blood-red hand which marked his

EBENEZER PECK. (SEE PAGE 269.) FROM A PAINTING BY HEALY, IN 1864, IN POSSESSION OF CHARLES F. PECK, ESQ.

nobility at fifteen years of age. Peace under any circumstances would doubtless have been irksome to him, but a peace which forbade him free access to his own hunting-grounds and to the graves of his fathers was more than he could now school himself to endure. He had come to believe that he had been foully wronged by the treaty which was his own act; he had even convinced himself that "land cannot be sold,"* a proposition in political economy which our modern socialists would be puzzled to accept or confute. Besides this, the tenderest feelings of his heart were outraged by this exclusion from his former domain. He had never passed a year since the death of his daughter without mak-

ing a pilgrimage to her grave at Oquawka and spending hours in mystic ceremonies and contemplation.† He was himself prophet as well as king, and had doubtless his share of mania, which is the strength of prophets. The promptings of his own broken heart readily seemed to him the whisperings of attendant spirits; and day by day these unseen incitements increased around him, until they could not be resisted even if death stood in the way.

He made his combinations during the winter, and had it not been for the loyal attitude of Keokuk, he could have brought the entire nation of the Sacs and Foxes to the war-path. As it was, the flower of the young men came with him when, with the opening spring, he

BLACK HAWK.

crossed the river once more. He came this time, he said, "to plant corn," but as a preliminary to this peaceful occupation of the land he marched up the Rock River, expecting to be joined by the Winnebagoes and Pottawatomies. But the time was past for honorable alliances among the Indians. His oath-bound confederates gave him little as-

sistance, and soon cast in their lot with the stronger party.

This movement excited general alarm in the State. General Atkinson, commanding the United States troops, sent a formal summons to Black Hawk to return; but the old chief was already well on his way to the lodge of his friend, the prophet Wabokishick, at Proph-

etstown, and treated the summons with contemptuous defiance. The Governor immediately called for volunteers, and was himself astonished at the alacrity with which the call was answered. Among those who enlisted at the first tap of the drum was Abraham Lincoln, and equally to his surprise and delight he was elected captain of his company. The volunteer organizations of those days were conducted on purely democratic principles. The company assembled on the green, an election was suggested, and three-fourths of the men walked over to where Lincoln was standing; most of the small remainder joined themselves to one Kirkpatrick, a man of some substance and standing from Spring Creek. We have the word of Mr. Lincoln for it, that no subsequent success ever gave him such unmixed pleasure as this earliest distinction. It was a sincere, unsought tribute of his equals to those physical and moral qualities which made him the best man of his hundred, and as such was accepted and prized.

At the Beardstown rendezvous, Captain Lincoln's company was attached to Colonel Samuel Thompson's regiment, the Fourth Illinois, which was organized at Richland, Sangamon County, on the 21st of April, and moved on the 27th, with the rest of the command under General Whiteside, for Yellow Banks, where the boats with provisions had been ordered to meet them. It was arduous marching. There were no roads and no bridges, and the day's work included a great deal of labor. The third day out they came to the Henderson River, a stream some fifty yards wide, swift and swollen with the spring thaws, with high and steep banks. To most armies this would have seemed a serious obstacle, but these backwoodsmen swarmed to the work like beavers, and in less than three hours* the river was crossed with the loss of only one or two horses and wagons. When they came to Yellow Banks, on the Mississippi, the provision-boats had not arrived, and for three days they waited there literally without food; very uncomfortable days for Governor Reynolds, who accompanied the expedition, and was forced to hear the outspoken comments of two thousand hungry men on his supposed inefficiency. But on the 6th of May the *William Wallace* arrived, and "this sight," says the Governor with characteristic sincerity, "was, I presume, the most interesting I ever beheld." From there they marched to the mouth of Rock River, and thence General Whiteside proceeded with his volunteers up the river some ninety miles to Dixon, where they halted to await the arrival of General Atkinson with the regular troops and

provisions. There they found two battalions of fresh horsemen, under Majors Stillman and Bailey, who had as yet seen no service and were eager for the fray. Whiteside's men were tired with their forced march, and besides, in their ardor to get forward, they had thrown away a good part of their provisions and left their baggage behind. It pleased the Governor, therefore, to listen to the prayers of Stillman's braves, and he gave them orders to "proceed to the head of Old Man's Creek, where it was supposed there were some hostile Indians, and coerce them into submission." "I thought," says the Governor in his memoirs, "they might discover the enemy."

The supposition was certainly well founded. They rode merrily away, came to Old Man's Creek, thereafter to be called Stillman's Run, and encamped for the night. By the failing light a small party of Indians was discovered on the summit of a hill a mile away, and a few courageous gentlemen hurriedly saddled their horses, and, without orders, rode after them. The Indians retreated, but were soon overtaken, and two or three of them killed. The volunteers were now strung along a half mile of hill and valley, with no more order or care than if they had been chasing rabbits. Black Hawk, who had been at supper when the running fight began, hastily gathered a handful of warriors and attacked the scattered whites. The onset of the savages acted like an icy bath on the red-hot valor of the volunteers; they turned and ran for their lives, stampeding the camp as they fled. There was very little resistance — so little that Black Hawk, fearing a ruse, tried to recall his warriors from the pursuit, but in the darkness and confusion could not enforce his orders. The Indians killed all they caught up with; but the volunteers had the fleetest horses, and only eleven were overtaken. The rest reached Dixon by twos and threes, rested all night, and took courage. General Whiteside marched out to the scene of the disaster the next morning, but the Indians were gone. They had broken up into small parties, and for several days they reaped the bloody fruit of their victory in the massacre of the peaceful settlements in the adjacent districts.

The time of enlistment of the volunteers had now come to an end, and the men, seeing no prospect of glory or profit, and weary of the work and the hunger which were the only certain incidents of the campaign, refused in great part to continue in service. But it is hardly necessary to say that Captain Lincoln was not one of these homesick soldiers. Not even the trammels of rank, which are usually so strong among the trailers of the saber, could restrain him from what he considered his sim-

A SOLDIER'S DISCHARGE FROM THE BLACK HAWK WAR, SIGNED BY A. LINCOLN, CAPTAIN.
 (IN POSSESSION OF O. H. OLDROYD, ESQ., SPRINGFIELD, ILLINOIS.)

ple duty. As soon as he was mustered out of his captaincy, he reenlisted on the same day, May 27, as a private soldier. Several other officers did the same, among them General Whiteside and Major Stuart. Lincoln became a member of Captain Elijah Iles's company of mounted volunteers, sometimes called the "Independent Spy Battalion," an organization unique of its kind, if we may judge from the account given by one of its troopers. It was not, says Mr. George W. Harrison, "under the control of any regiment or brigade, but received orders directly from the Commander-in-Chief, and always, when with the army, camped within the lines, and had many other privileges, such as having no camp duties to perform and drawing rations as much and as often as we pleased," which would seem to liken this battalion as nearly as possible to the fabled "regiment of brigadiers." With this *élite* corps Lincoln served through his second enlistment, though it was not his fortune to take part in either of the two engagements in which General Henry broke and destroyed forever the power of Black Hawk and the British band of Sacs and Foxes at the Wisconsin Bluffs and the Bad Axe.

After Lincoln was relieved of the weight of dignity involved in his captaincy, the war became a sort of holiday, and the tall private from New Salem enjoyed it as much as any one. He entered with great zest into the athletic sports with which soldiers love to beguile

the tedium of camp. He was admitted to be the strongest man in the army, and, with one exception, the best wrestler. Indeed his friends never admitted the exception, and severely blamed Lincoln for confessing himself defeated on the occasion when he met the redoubtable Thompson, and the two fell together on the turf. His popularity increased from the beginning to the end of the campaign, and those of his comrades who still survive always speak with hearty and affectionate praise of his character and conduct in those rough yet pleasantly remembered days.

The Spy Battalion formed no part of General Henry's forces when, by a disobedience of orders as prudent as it was audacious, he started with his slender force on the fresh trail which he was sure would lead him to Black Hawk's camp. He found and struck the enemy at bay on the bluffs of the Wisconsin River on the 21st of July, and inflicted upon them a signal defeat. The broken remnant of Black Hawk's power then fled for the Mississippi River, the whole army following in close pursuit—General Atkinson in front and General Henry bringing up the rear. Fortune favored the latter once more, for while Black Hawk with a handful of men was engaging and drawing away the force under Atkinson, General Henry struck the main trail, and brought on the battle of the Bad Axe, if that could be called a battle which was an easy slaughter of the weary and discouraged sav-

ages, fighting without heart or hope, an army in front and the great river behind. Black Hawk escaped the fate of his followers, to be captured a few days later through the treachery of his allies. He was carried in triumph to Washington and presented to President Jackson, to whom he made this stern and defiant speech, showing how little age or disaster could do to tame his indomitable spirit: "I am a man, and you are another. I did not expect to conquer the white people. I took up the hatchet to avenge injuries which could no longer be borne.* Had I borne them longer my people would have said: 'Black Hawk is a squaw; he is too old to be a chief; he is no Sac.' This caused me to raise the war-whoop. I say no more of it; all is known to you." He returned to Iowa, and lived to a great age. When he died he received the supreme honors paid only to mighty men of war among his people, and was buried on the high bank of the Mississippi, in arms and in war-paint, facing the rising sun.

It was on the 16th of June, a month before the slaughter of the Bad Axe, that the battalion to which Lincoln belonged was finally mustered out, at Whitewater, Wisconsin. His final release from the service was signed by a young lieutenant of artillery, Robert Anderson, who, twenty-nine years later, in one of the most awful crises in our annals, was to sustain to Lincoln relations of prodigious importance, on a scene illuminated by the flash of the opening guns of the civil war.† The men started home the next day in high spirits, like

*It is a noteworthy coincidence that President Lincoln's proclamation at the opening of the war calls for troops "to redress wrongs already long enough endured."

† A story to the effect that Lincoln was mustered into service by Jefferson Davis has for a long time been current, but the strictest search in the records fails to confirm it. We are indebted to General R. C. Drum, Adjutant-General of the Army, for an interesting letter giving all the known facts in relation to this story. General Drum says: "The company of the Fourth Regiment Illinois Mounted Volunteers, commanded by Mr. Lincoln, was with others called out by Governor Reynolds, and was organized at Richland, Sangamon County, Illinois, April 21, 1832. The muster-in roll is not on file, but the records show that the company was mustered out at the mouth of Fox River, May 27, 1832, by Nathaniel Buckmaster, Brigade-Major to General Samuel Whiteside, Illinois Volunteers. On the muster-roll of Captain Elijah Iles's company, Illinois Mounted Volunteers, A. Lincoln (Sangamon County) appears as a private from May 27, 1832, to June 16, 1832, when the company was mustered out of service by Lieutenant Robert Anderson, Third United States Artillery and Colonel (Assistant Inspector-General) Illinois volunteers. Brigadier-General Henry Atkinson, in his report of May 30, 1832, stated that the Illinois Volunteers were called out by the Governor of that State, but in haste and for no definite period of service. On their arrival at Ottawa they became clamorous for their discharge, which the Governor granted, retaining—of those who were

school-boys for their holidays. Lincoln had need, like Horatio, of his good spirits, for they were his only outfit for the long journey to New Salem, he and his mess-mate Harrison‡ having had their horses stolen the day before by some patriot over-anxious to reach home. But, as Harrison says, "I laughed at our fate, and he joked at it, and we all started off merrily. The generous men of our company walked and rode by turns with us, and we fared about equal with the rest. But for this generosity our legs would have had to do the better work; for in that day this dreary route furnished no horses to buy or to steal; and whether on horse or afoot, we always had company, for many of the horses' backs were too sore for riding." It is not hard to imagine with what quips and quirks of native fancy Lincoln and his friends beguiled the way through forest and prairie. With youth, good health, and a clear conscience, and even then the dawn of a young and undefiled ambition in his heart, nothing was wanting to give zest and spice to this long, sociable walk of a hundred leagues. One joke is preserved, and this one is at the expense of Lincoln. One chilly morning he complained of being cold. "No wonder," said some facetious cavalier, "there is so much of you on the ground."§ We hope Lincoln's contributions to the fun were better than this, but of course the prosperity of these jests lay rather in the liberal ears that heard them than in the good-natured tongues that uttered them.

Lincoln and Harrison could not have been discharged and volunteered for a further period of twenty days—a sufficient number of men to form six companies, which General Atkinson found at Ottawa on his arrival there from Rock River. General Atkinson further reports that these companies and some three hundred regular troops, remaining in position at Rock River, were all the force left him to keep the enemy in check until the assemblage of the three thousand additional Illinois militia called out by the Governor upon his (General A.'s) requisition, to rendezvous at Ottawa, June 12–15, 1832.

"There can be no doubt that Captain Iles's company, mentioned above, was one of the six which served until June 16, 1832, while the fact is fully established that the company of which Mr. Lincoln was a member was mustered out by Lieutenant Robert Anderson, who, in April, 1861, was in command of Fort Sumter. There is no evidence to show that it was mustered in by Lieutenant Jefferson Davis. Mr. Davis's company (B, First United States Infantry) was stationed at Fort Crawford, Wisconsin, during the months of January and February, 1832, and he is borne on the rolls as 'absent on detached service at the Dubuque mines by order of Colonel Morgan.' From March 26 to August 18, 1832, the muster-rolls of his company report him as absent on furlough."

‡ George W. Harrison, who gives an entertaining account of his personal experiences in Lamon, p. 116.

§ Dr. Holland gives this homely joke, p. 71, but transfers it to a time four years later, when Lincoln had permanently assumed shoes and had a horse of his own.

altogether penniless, for at Peoria they bought a canoe and paddled down to Pekin. Here the ingenious Lincoln employed his hereditary talent for carpentry by making an oar for the frail vessel while Harrison was providing the commissary stores. The latter goes on to say: "The river, being very low, was without current, so that we had to pull hard to make half the speed of legs on land; in fact, we let her float all night, and on the next morning always found the objects still visible that were beside us the previous evening. The water was remarkably clear for this river of plants, and the fish appeared to be sporting with us as we moved over or near them. On the next day after we left Pekin we overhauled a raft of saw-logs, with two men afloat on it to urge it on with poles and to guide it in the channel. We immediately pulled up to them and went on the raft, where we were made welcome by various demonstrations, especially by an invitation to a feast on fish, corn-bread, eggs, butter, and coffee, just prepared for our benefit. Of these good things we ate almost immoderately, for it was the only warm meal we had made for several days. While preparing it, and after dinner, Lincoln entertained them, and they entertained us for a couple of hours very amusingly." Kindly human companionship was a luxury in that green wilderness, and was readily appreciated and paid for.

The returning warriors dropped down the river to the village of Havana—from Pekin to Havana in a canoe! The country is full of these geographical nightmares, the necessary result of freedom of nomenclature bestowed by circumstances upon minds equally destitute of taste or education. There they sold their boat,—no difficult task, for a canoe was a staple article in any river-town,—and again set out "the old way, over the sand-ridges, for Petersburg. As we drew near home, the impulse became stronger and urged us on amazingly. The long strides of Lincoln, often slipping back in the loose sand six inches every step, were just right for me; and he was greatly diverted when he noticed me behind him stepping along in his tracks to keep from slipping." Thus the two comrades came back from their soldierings to their humble homes, from which Lincoln was soon to start on the way marked out for him by Providence, with strides which no comrade, with whatever good-will, might hope to follow.

He never took his campaigning seriously.

* We are aware that all former biographers have stated that Lincoln's candidacy for the Legislature was subsequent to his return from the war, and a consequence of his service. But his circular is

The politician's habit of glorifying the petty incidents of a candidate's life always seemed absurd to him, and in his speech, made in 1848, ridiculing the effort on the part of General Cass's friends to draw some political advantage from that gentleman's respectable but obscure services on the frontier in the war with Great Britain, he estopped any future eulogist from painting his own military achievements in too lively colors. "Did you know, Mr. Speaker," he said, "I am a military hero? In the days of the Black Hawk war I fought, bled, and came away. I was not at Stillman's defeat, but I was about as near it as General Cass was to Hull's surrender; and, like him, I saw the place very soon afterwards. It is quite certain I did not break my sword, for I had none to break, but I bent my musket pretty badly on one occasion. If General Cass went in advance of me picking whortleberries, I guess I surpassed him in charges on the wild onions. If he saw any live fighting Indians, it was more than I did, but I had a good many bloody struggles with the mosquitoes; and although I never fainted from loss of blood, I can truly say I was often very hungry. Mr. Speaker, if ever I should conclude to doff whatever our Democratic friends may suppose there is of black-cockade Federalism about me, and thereupon they shall take me up as their candidate for the Presidency, I protest that they shall not make fun of me, as they have of General Cass, by attempting to write me into a military hero."

AN UNSUCCESSFUL CANVASS.

THE discharged volunteer arrived in New Salem only ten days before the August election, in which he had a deep personal interest. Before starting for the wars he had announced himself, according to the custom of the time, by a handbill circular, as a candidate for the Legislature from Sangamon County.* He had done this in accordance with his own natural bent for public life and desire for usefulness and distinction, and not without strong encouragement from friends whose opinion he valued. He had even then considerable experience in speaking and thinking on his feet. He had begun his practice in that direction before leaving Indiana, and continued it everywhere he had gone. Mr. William Butler tells us that on one occasion, when Lincoln was a farm-hand at Island Grove, the famous circuit-rider, Peter Cart-

dated March 9, 1832, and the "Sangamon Journal" mentions his name among the candidates in July, and apologizes for having accidentally omitted it in May.

A. LINCOLN'S SURVEYING INSTRUMENTS AND SADDLE-BAG.
(IN POSSESSION OF LINCOLN MONUMENT COLLECTION.)

wright, came by, electioneering for the Legislature, and Lincoln at once engaged in a discussion with him in the cornfield, in which the great Methodist was equally astonished at the close reasoning and the uncouth figure of Mr. Brown's extraordinary hired man. At another time, after one Posey, a politician in search of office, had made a speech in Macon, John Hanks, whose admiration of his cousin's oratory was unbounded, said that "Abe could beat it." He turned a keg on end, and the tall boy mounted it and made his speech. "The subject was the navigation of the Sangamon, and Abe beat him to death," says the loyal Hanks. So it was not with all the tremor of a complete novice that the young man took the stump during the few days left him between his return and the election.

He ran as a Whig. As this has been denied on authority which is generally trustworthy, it is well enough to insist upon the fact. In one of the few speeches of his which, made at this time, have been remembered and reported, he said: "I am in favor of a national bank; I am in favor of the internal improvement system, and of a high protective tariff. These are my sentiments and political principles." Nothing could be more unqualified or outspoken than this announcement of his adhesion to what was then and for years afterwards called "the American System" of Henry Clay. Other testimony is not wanting to the same effect. Both Major Stuart and Judge Logan* say that Lincoln ran in 1832 as a Whig, and that his speeches were unequivocally in defense of the principles of that party. Without discussing the merits of the party or its purposes, we may insist that his adopting them thus openly at the outset of his career was an extremely characteristic act, and marks thus early the scrupulous conscientiousness which shaped every action of his life. The State of Illinois was by a large majority Democratic,

hopelessly attached to the person and policy of Jackson. Nowhere had that despotic leader more violent and unscrupulous partisans than there. They were proud of their very servility, and preferred the name of "whole-hog Jackson men" to that of Democrats. The Whigs embraced in their scanty ranks the leading men of the State, those who have since been most distinguished in its history, such as S. T. Logan, Stuart, Browning, Dubois, Hardin, Breese, and many others. But they were utterly unable to do anything except by dividing the Jackson men, whose very numbers made their party unwieldy, and by throwing their votes with the more decent and conservative portion of them. In this way, in the late election, they had secured the success of Governor Reynolds—the Old Ranger—against Governor Kinney, who represented the vehement and proscriptive spirit which Jackson had just breathed into the party. He had visited the General in Washington, and had come back giving out threatenings and slaughter against the Whigs in the true Tennessee style, declaring that "all Whigs should be whipped out of office like dogs out of a meat-house"; the force of south-western simile could no farther go.† But the great popularity of Reynolds and the adroit management of the Whigs carried him through successfully. A single fact will show on which side the people who could read were enlisted. The "whole-hog" party had one newspaper, the opposition five. Of course it would have been impossible for Reynolds to poll a respectable vote if his loyalty to Jackson had been seriously doubted. As it was, he lost many votes through a report that he had been guilty of saying that "he was as strong for Jackson as any reasonable man should be." The Governor himself, in his naïve account of the canvass, acknowledges the damaging nature of this accusation, and comforts himself with quoting an indiscretion of Kinney's, who opposed a projected canal on the ground that "it would flood the country with Yankees."

It showed some moral courage, and certainly an absence of the shuffling politician's fair-weather policy, that Lincoln, in his friendless and penniless youth, at the very beginning of his career, when he was not embarrassed by antecedents or family connections, and when, in fact, what little social influence he knew would have led him the other way, chose to oppose a furiously intolerant majority,

* The Democrats of New Salem worked for Lincoln out of their personal regard for him. That was the general understanding of the matter here at the time. In this he made no concession of principle whatever. He was as stiff as a man could be in his

Whig doctrines. They did this for him simply because he was popular—because he was Lincoln.

July 6, 1875.

STEPHEN T. LOGAN.

† Reynolds's "My Own Times," p. 291.

and to take his stand with the party which was doomed to long-continued defeat in Illinois. The motives which led him to take this decisive course are not difficult to imagine. The better sort of people in Sangamon County were Whigs, though the majority were Democrats, and he preferred through life the better sort to the majority. The papers he read were the Louisville "Journal" and the "Sangamon Journal," both Whig. Reading the speeches and debates of the day, he sided with Webster against Calhoun, and with Clay against anybody. Though his notions of politics, like those of any ill-educated young man of twenty-two, must have been rather crude, and not at all sufficient to live and to die by, he had adopted them honestly and sincerely, with no selfish regard to his own interests; and though he ardently desired success, he never abated one jot or tittle of his convictions for any possible personal gain, then or thereafter.

In the circular in which he announced his candidacy he made no reference to national politics, but confined himself mainly to a discussion of the practicability of improving the navigation of the Sangamon, the favorite hobby of the place and time. He had no monopoly of this "issue." It formed the burden of nearly every candidate's appeal to the people in that year. The excitement occasioned by the trip of the *Talisman* had not yet died away, although the little steamer was now dust and ashes, and her bold commander had left the State to avoid an awkward meeting with the sheriff. The hope of seeing Springfield an emporium of commerce was still lively among the citizens of Sangamon County, and in no one of the handbills of the political aspirants of the season was that hope more judiciously encouraged than in the one signed by Abraham Lincoln. It was a well-written circular, remarkable for its soberness and reserve when we consider the age and the limited advantages of the writer. It concluded in these words:

"Upon the subjects of which I have treated, I have spoken as I have thought. I may be wrong in regard to any or all of them; but holding it a sound maxim that it is better only sometimes to be right than at all times wrong, so soon as I discover my opinions to be erroneous, I shall be ready to renounce them. . . . Every man is said to have his peculiar ambition. Whether it be true or not, I can say, for one, that I have no other so great as that of being truly esteemed of my fellow-men, by rendering myself worthy of their esteem. How far I shall succeed in gratifying this ambition is yet to be developed. I am young, and unknown to many of you. I was born and have ever remained in the most humble walks of life. I have no wealthy or powerful relations or friends to recommend me. My case is thrown exclusively upon the independent voters of the county; and, if elected, they will

have conferred a favor upon me, for which I shall be unremitting in my labors to compensate. But if the good people in their wisdom shall see fit to keep me in the background, I have been too familiar with disappointments to be very much chagrined."

This is almost precisely the style of his later years. The errors of grammar and construction which spring invariably from an effort to avoid redundancy of expression remained with him through life. He seemed to grudge the space required for necessary parts of speech. But his language was at twenty-two, as it was thirty years later, the simple and manly attire of his thought, with little attempt at ornament and none at disguise. There was an intermediate time when he sinned in the direction of fine writing; but this ebullition soon passed away, and left that marvelously strong and transparent style in which his two inaugurals were written.

Of course, in the ten days left him after his return from the field, a canvass of the county, which was then some thousands of square miles in extent, was out of the question. He made a few speeches in the neighborhood of New Salem, and at least one in Springfield. He was wholly unknown there except by his few comrades in arms. We find him mentioned in the county paper only once during the summer, in an editorial note adding the name of Captain Lincoln to those candidates for the Legislature who were periling their lives on the frontier and had left their reputations in charge of their generous fellow-citizens at home. On the occasion of his speaking at Springfield, most of the candidates had come together to address a meeting there to give their electors some idea of their quality. These were severe ordeals for the rash aspirants for popular favor. Besides those citizens who came to listen and judge, there were many whose only object was the free whisky provided for the occasion, and who, after potations pottle-deep, became not only highly unparliamentary but even dangerous to life and limb. This wild chivalry of Lick Creek was, however, less redoubtable to Lincoln than it might be to an urban statesman unacquainted with the frolic brutality of Clary's Grove. Their gambols never caused him to lose his self-possession. It is related that once, while he was speaking, he saw a ruffian attack a friend of his in the crowd, and the rencontre not resulting according to the orator's sympathies, he descended from the stand, seized the objectionable fighting man by the neck, "threw him some ten feet," then calmly mounted to his place, and finished his speech, the course of his logic undisturbed by this athletic parenthesis. Judge Logan saw Lincoln for the first time on the day when he came up to Spring-

field on his canvass this summer. He thus speaks of his future partner: "He was a very tall, gawky, and rough-looking fellow then; his pantaloons didn't meet his shoes by six inches. But after he began speaking I became very much interested in him. He made a very sensible speech. His manner was very much the same as in after life; that is, the same peculiar characteristics were apparent then, though of course in after years he evinced more knowledge and experience. But he had then the same novelty and the same peculiarity in presenting his ideas. He had the same individuality that he kept through all his life."

There were two or three men at the meeting whose good opinion was worth more than all the votes of Lick Creek to one beginning life: Stephen T. Logan, a young lawyer who had recently come from Kentucky with the best equipment for a *nisi prius* practitioner ever brought into the State; Major Stuart, whom we have met in the Black Hawk war, once commanding a battalion and then marching as a private; and William Butler, afterwards prominent in State politics, at that time a young man of the purest Western breed in body and character, clear-headed and courageous, and ready for any emergency where a friend was to be defended or an enemy punished. We do not know whether Lincoln gained any votes that day, but he gained what was far more valuable, the active friendship of these able and honorable men, all Whigs and all Kentuckians like himself.

The acquaintances he made in his canvass, the practice he gained in speaking, and the added confidence which this experience of measuring his abilities with those of others gave, were all the advantages which Lincoln derived from this attempt. He was defeated, for the only time in his life, in a contest before the people. The fortunate candidates were E. D. Taylor, J. T. Stuart, Achilles Morris, and Peter Cartwright, the first of whom received 1127 votes and the last 815.* Lincoln's position among the eight defeated candidates was a very respectable one. He had 657 votes, and there were five who fared worse, among them his old adversary Kirkpatrick. What must have been especially gratifying to him was the fact that he received the almost unanimous vote of his own neighborhood, the precinct of New Salem, 277 votes against 3, a result which showed more strongly than any words could do the extent of the attachment and the confidence which his genial and upright character had inspired among those who knew him best.

* "Sangamon Journal," August 11, 1832.

STOREKEEPER, POSTMASTER AND SURVEYOR.

HAVING been, even in so slight a degree, a soldier and a politician, he was unfitted for a day laborer; but being entirely without means of subsistence, he was forced to look about for some suitable occupation. It is said by Dr. Holland that he thought seriously at this time of learning the trade of a blacksmith, and using in that honest way the sinew and brawn which nature had given him. But an opening for another kind of business occurred, which prevented his entering upon any merely mechanical occupation. Two of his most intimate friends were the brothers Herndon, called, according to the fashion of the time, which held it unfriendly to give a man his proper name, and arrogant for him to claim it, "Row" and "Jim." They kept one of those grocery stores in which everything salable on the frontier was sold, and which seem to have changed their occupants as rapidly as sentry-boxes. "Jim" sold his share to an idle and dissolute man named Berry, and "Row" soon transferred his interest to Lincoln. It was easy enough to buy, as nothing was ever given in payment but a promissory note. A short time afterwards, one Reuben Radford, who kept another shop of the same kind, happened one evening to attract the dangerous attention of the Clary's Grove boys, who, with their usual prompt and practical facetiousness, without a touch of malice in it, broke his windows and wrecked his store. The next morning, while Radford was ruefully contemplating the ruin, and doubtless concluding that he had had enough of a country where the local idea of neighborly humor found such eccentric expression, he hailed a passer-by named Greene, and challenged him to buy his establishment for four hundred dollars. This sort of trade was always irresistible to these Western speculators, and Greene at once gave his note for the amount. It next occurred to him to try to find out what the property was worth, and doubting his own skill, he engaged Lincoln to make an invoice of it. The young merchant, whose appetite for speculation had just been whetted by his own investment, undertook the task, and finding the stock of goods rather tempting, offered Greene two hundred and fifty dollars for his bargain, which was at once accepted. Not a cent of money changed hands in all these transactions. By virtue of half a dozen signatures, Berry and Lincoln became proprietors of the only mercantile establishment in the village, and the apparent wealth of the community was increased by a liberal distribution of their notes among the Herndons, Radford, Greene, and a Mr. Rutledge whose business they had also bought.

PLAN OF ROAD SURVEYED

Fortunately for Lincoln and for the world, the enterprise was not successful. It was entered into without sufficient reflection, and from the very nature of things was destined to fail. To Berry the business was merely the refuge of idleness. He spent his time in gossip and drank up his share of the profits, and it is probable that Lincoln was far more interested in politics and general reading than

in the petty traffic of his shop. In the spring of the next year, finding that their merchandise was gaining them little or nothing, they concluded to keep a tavern in addition to their other business, and the records of the County Court of Sangamon County show that Berry took out a license for that purpose on the 6th of March, 1833.* But it was even then too late for any expedients to save the

* The following is an extract from the court record: "March 6, 1833. Ordered that William F. Berry, in the name of Berry and Lincoln, have license to keep a tavern in New Salem, to continue twelve months from this date, and that they pay one dollar in addition to six dollars heretofore prepaid as per Treasurer's receipt, and that they be allowed the following rates,

viz.: French brandy, per pint, 25; Peach, 18¾; Apple, 12; Holland gin, 18¾; Domestic, 12½; Wine, 25; Rum, 18¾; Whisky, 12½; Breakfast, dinner, or supper, 25; Lodging for night, 12½; Horse for night, 25; Single feed, 12½; Breakfast, dinner, or supper, for stage passengers, 37½.

"Who gave bond as required by law."

To the County Commissioners court for the County of Sangamon at its June term 1834.

We the undersigned being appointed to view and locate a road. Beginning at Musick's ferry on Salt creek. (Via) New Salem to the County line in the direction to Jacksonville. respectfully report that we have performed the duties of said view and location as required by law and that we have made the location on good ground and believe the establishment of the same to be necessary and proper.

moribund partnership. The tavern was never opened, for about this time Lincoln and Berry were challenged to sell out to a pair of vagrant brothers named Trent, who, as they had no idea of paying, were willing to give their notes to any amount. They soon ran away, and Berry expired, extinguished in rum. Lincoln was thus left loaded with debts, and with no assets except worthless notes of Berry and the Trents. It is greatly to his credit that he never thought of doing by others as others had done by him. The morality of the frontier was deplorably loose in such matters, and most of these people would have concluded that the failure of the business expunged its liabilities. But Lincoln made no effort even to compromise the claims against him. He promised to pay when he could, and it took the labor of years to do it; but he paid at last every farthing of the debt, which seemed to him and his friends so large that it was called among them "the national debt."

He had already begun to read elementary books of law, borrowed from Major Stuart and other kindly acquaintances. Indeed, it is quite possible that Berry and Lincoln might have succeeded better in business if the junior member of the firm had not spent so much of his time reading Blackstone and Chitty in the shade of a great oak just outside the door, while the senior quietly fuddled himself within. Eye-witnesses still speak of the grotesque youth, habited in homespun tow, lying on his back with his feet on the trunk of the tree, and poring over his book by the hour, "grinding around with the shade," as it shifted from north to east. After his store, to use his own expression, had "winked out," he applied himself with more continuous energy to his reading, doing merely what odd jobs came to his hand to pay his current expenses, which were of course very slight. He sometimes helped his friend Ellis in his store; sometimes went into the field and renewed his exploits as a farm-hand, which had gained him a traditional fame in Indiana; sometimes employed his clerkly hand in straightening up a neglected ledger. It is probable that he worked for his board oftener than for any

other compensation, and his hearty friendliness and vivacity, as well as his industry in the field, made him a welcome guest in any farmhouse in the county. His strong arm was always at the disposal of the poor and needy; it is said of him, with a graphic variation of a well-known text, "that he visited the fatherless and the widow and chopped their wood."

In the spring of this year, 1833, he was appointed Postmaster of New Salem, and held the office for three years. Its emoluments were slender and its duties light, but there was in all probability no citizen of the village who could have made so much of it as he. The mails were so scanty that he was said to carry them in his hat, and he is also reported to have read every newspaper that arrived; it is altogether likely that this formed the leading inducement to his taking the office. His incumbency lasted until New Salem ceased to be populous enough for a post-station and the mail went by to Petersburg. Dr. Holland relates a sequel to this official experience which illustrates the quaint honesty of the man. Several years later, when he was a practicing lawyer, an agent of the Post-office Department called upon him, and asked for a balance due from the New Salem office, some seventeen dollars. Lincoln rose, and opening a little trunk which lay in a corner of the room, took from it a cotton rag in which was tied up the exact sum required. "I never use any man's money but my own," he quietly remarked. When we consider the pinching poverty in which these years had been passed, we may appreciate the self-denial which had kept him from making even a temporary use of this little sum of government money.

John Calhoun, the Surveyor of Sangamon County, was at this time overburdened with work. The principal industry then was speculation in land. Every settler of course wanted his farm surveyed and marked out for him, and every community had its syndicate of leading citizens who cherished a scheme of laying out a city somewhere. In many cases the city was plotted, the sites of the principal buildings, including a court-house and a university, were determined, and a sonorous

name was selected out of Plutarch, before its location was even considered. For this latter office the intervention of an official surveyor was necessary, and therefore Mr. Calhoun had more business than he could attend to without assistance. Looking about for a young man of good character, intelligent enough to learn surveying at short notice, his attention was soon attracted to Lincoln. He offered young

Abraham a book containing the elements of the art, and told him when he had mastered it he should have employment. The offer was a flattering one, and Lincoln, with that steady self-reliance of his, accepted it, and armed with his book went out to the schoolmaster's (Menton Graham), and in six weeks' close application made himself a surveyor.*

It will be remembered that Washington in

Know all men by these presents that we Thomas Lincoln and Richard Berry are held and firmly bound unto his Excellency the governor of Kentucky his heirs and full sum of fifty pounds current money to the payment of which well and truly to be made to the said governor and his successors we bind our selves our heirs & jointly and severally firmly by these presents sealed with our seals and dated this 10th day of June 1806. The condition of the above obligation is such that whereas there is an arranged & jointly intended between the above bound Thomas Lincoln and Nancy Banks for which license has issued now if there be no lawful cause to obstruct the said marriage then this obligation to be void unless to remain in full force & virtue in law

MARRIAGE BOND OF THOMAS LINCOLN.

* There has been some discussion as to whether Lincoln served as deputy under Calhoun or Neale. The truth is that he served under both of them. Calhoun was surveyor in 1833, when Lincoln first learned the business. Neale was elected in 1835, and immediately appointed Lincoln and Calhoun as his deputies. The "Sangamon Journal" of Sept. 12, 1835, contains the following official advertisement:

SURVEYOR'S NOTICE.—I have appointed John B. Watson, Abram Lincoln, and John Calhoun deputy surveyors for Sangamon County. In my absence from town, any persons wishing their lands surveyed will do well to call at the Recorder's office and enter his or their names in a book left for that purpose, stating township and range in which they respectively live, and their business shall be promptly attended to.

T. M. NEALE.

An article by Colonel G. A. Pierce, printed April 21, 1881, in the Chicago "Inter-Ocean," describes an interview held in that month with W. G. Green, of Menard County, in which this matter is referred to. But Mr. Green relies more on the document in his

possession than on his recollection of what took place in 1833. "Where did Lincoln learn his surveying?" I asked. "Took it up himself," replied Mr. Green, "as he did a hundred things, and mastered it too. When he acted as surveyor here he was a deputy of T. M. Neale, and not of Calhoun, as has often been said. There was a dispute about this, and many sketches of his life gave Calhoun (Candle-box Calhoun, as he was afterwards known during the Kansas troubles and election frauds) as the surveyor, but it was Neale." Mr. Green turned to his desk and drew out an old certificate, in the handwriting of Lincoln, giving the boundaries of certain lands, and signed, "T. M. Neale, Surveyor, by A. Lincoln, Deputy," thus settling the question. Mr. Green was a Democrat, and has leaned towards that party all his life, but what he thought and thinks of Lincoln can be seen by an indorsement on the back of the certificate named, which is as follows:

Preserve this, as it is from the noblest of God's creation — A. Lincoln, the 2d preserver of his country. May 3, 1865.— Penned by W. G. Green, who taught Lincoln the English grammar in 1831.

his youth adopted the same profession, but there were few points of similarity in the lives of the two greatest of our Presidents, in youth or later manhood. The Virginian had every social advantage in his favor, and was by nature a man of more thrift and greater sagacity in money matters. He used the knowledge gained in the practice of his profession so wisely that he became rather early in life a large land-holder, and continually increased his possessions until his death. Lincoln, with almost unbounded opportunities for the selection and purchase of valuable tracts, made no use whatever of them. He employed his skill and knowledge merely as a bread-winner, and made so little provision for the future that when Mr. Van Bergen, who had purchased the Radford note, sued and got judgment on it, his horse and his surveying instruments were taken to pay the debt, and only by the generous intervention of a friend was he able to redeem these invaluable means of living. He was, nevertheless, an excellent surveyor. His portion of the public work executed under the directions of Mr. Calhoun and his successor, T. M. Neale, was well performed, and he soon found his time pretty well employed with private business which came to him from Sangamon and the adjoining counties. Early in the year 1834 we find him appointed one of three "viewers" to locate a road from Salt Creek to the county line in the direction of Jacksonville. The board seems to have consisted mainly of its chairman, as Lincoln made the deposit of money required by law, surveyed the route, plotted the road, and wrote the report.*

Though it is evident that the post-office and the surveyor's level were not making a rich man of him, they were sufficient to enable him to live decently, and during the year he greatly increased his acquaintance and his influence in the county. The one followed the other naturally; every acquaintance he made became his friend, and even before the end of his unsuccessful canvass in 1832 it had be-

come evident to the observant politicians of the district that he was a man whom it would not do to leave out of their calculations. There seemed to be no limit to his popularity nor to his aptitudes, in the opinion of his admirers. He was continually called on to serve in the most incongruous capacities. Old residents say he was the best judge at a horse-race the county afforded; he was occasionally second in a duel of fisticuffs, though he usually contrived to reconcile the adversaries on the turf before any damage was done; he was the arbiter on all controverted points of literature, science, or woodcraft among the disputatious denizens of Clary's Grove, and his decisions were never appealed from. His native tact and humor were invaluable in his work as a peacemaker, and his enormous physical strength, which he always used with a magnanimity rare among giants, placed his off-hand decrees beyond the reach of contemptuous question. He composed differences among friends and equals with good-natured raillery, but he was as rough as need be when his wrath was roused by meanness and cruelty. We hardly know whether to credit some of the stories, apparently well-attested by living witnesses, of his prodigious muscular powers. He is said to have lifted, at Rutledge's mill, a box of stones weighing over half a ton. It is also related that he could raise a barrel of whisky from the ground and drink from the bung—but the narrator adds that he never swallowed the whisky. Whether these traditions are strictly true or not, they are evidently founded on the current reputation he enjoyed among his fellows for extraordinary strength, and this was an important element in his influence. He was known to be capable of handling almost any man he met, yet he never sought a quarrel. He was everybody's friend, and yet used no liquor or tobacco. He was poor and had scarcely ever been at school, yet he was the best-informed young man in the village. He had grown up on the frontier, the utmost

* As this is probably the earliest public document extant written and signed by Lincoln, we give it in full:

March 3, 1834. Reuben Harrison presented the following petition: We, the undersigned, respectfully request your honorable body to appoint viewers to view and locate a road from Musick's ferry on Salt Creek, via New Salem, to the county line in the direction of Jacksonville.

And Abram Lincoln deposited with the clerk \$10, as the law directs. Ordered, that Michael Killion, Hugh Armstrong, and Abram Lincoln be appointed to view said road, and said Lincoln to act as surveyor.

To the County Commissioners' Court for the county of Sangamon, at its June term, 1834. We, the undersigned, being appointed to view and locate a road, beginning at Musick's ferry on Salt Creek, via New Salem, to the county line in the direction to

Jacksonville, respectfully report that we have performed the duties of said view and location, as required by law, and that we have made the location on good ground, and believe the establishment of the same to be necessary and proper.

The inclosed map gives the courses and distances as required by law. Michael Killion, Hugh Armstrong, A. Lincoln.

(Indorsement in pencil, also in Lincoln's handwriting:)

A. Lincoln, 5 days at \$3.00, \$15.00. John A. Kelsoe, chain-bearer, for 5 days, at 75 cents, \$3.75. Robert Lloyd, at 75 cents, \$3.75. Hugh Armstrong, for services as axeman, 5 days at 75 cents, \$3.75. A. Lincoln, for making plot and report, \$2.50.

(On Map.)

Whole length of the road, 26 miles and 70 chains. Scale, 2 inches to the mile.

fringe of civilization, yet he was gentle and clean of speech, innocent of blasphemy or scandal. His good qualities might have excited resentment if displayed by a well-dressed stranger from an Eastern State, but the most uncouth ruffians of New Salem took a sort of proprietary interest and pride in the decency and the cleverness and the learning of their friend and comrade, Abe Lincoln.

It was regarded, therefore, almost as a matter of course that Lincoln should be a candidate for the Legislature at the next election, which took place in August, 1834. He was sure of the united support of the Whigs, and so many of the Democrats also wanted to vote for him that some of the leading members of that party came to him and proposed they should give him an organized support. He was too loyal a partisan to accept their overtures without taking counsel from the Whig candidates. He laid the matter before Major Stuart, who at once advised him to make the canvass. It was a generous and chivalrous action, for by thus encouraging the candidacy of Lincoln he was endangering his own election. But his success two years before, in the face of a vindictive opposition led by the strongest Jackson men in the district, had made him somewhat confident, and he perhaps thought he was risking little by giving a helping hand to his comrade in the Spy Battalion. Before the election Lincoln's popularity developed itself in rather a portentous manner, and it required some exertion to save the seat of his generous friend. At the close of the poll, the four successful candidates held the following relative positions: Lincoln, 1376; Dawson, 1370; Carpenter, 1170; and Stuart, at that time probably the most prominent young man in the district, and the one marked out by the public voice for an early election to Congress, 1164.

LEGISLATIVE EXPERIENCE.—MEETING WITH
STEPHEN A. DOUGLAS.—THE
“LONG NINE.”

THE election of Mr. Lincoln to the Legislature may be said to have closed the pioneer portion of his life. He was done with the wild carelessness of the woods, with the jolly ruffianism of Clary's Grove, with the petty chaffering of grocery stores, with odd jobs for daily bread, with all the uncouth squalor of the frontier poverty. It was not that his pecuniary circumstances were materially improved. He was still, and for years continued to be, a very poor man, harassed by debts which he was always working to pay, and sometimes in distress for the means of decent subsistence. But from this time forward his asso-

ciations were with a better class of men than he had ever known before, and a new feeling of self-respect must naturally have grown up in his mind from his constant intercourse with them—a feeling which extended to the minor morals of civilized life. A sophisticated reader may smile at the mention of anything like social ethics in Vandalia in 1834; but, compared with Gentryville and New Salem, the society which assembled in the winter at that little capital was polished and elegant. The State then contained nearly two hundred and fifty thousand inhabitants, and the members of the Legislature, elected purely on personal grounds, nominated by themselves or their neighbors without the intervention of party machinery, were necessarily the leading men, in one way or another, in their several districts. Among the colleagues of Lincoln at Vandalia were young men with destinies only less brilliant than his own. They were to become governors, senators, and judges; they were to organize the Whig party of Illinois, and afterwards the Republican; they were to lead brigades and divisions in two great wars. Among the first persons he met there—not in the Legislature proper, but in the lobby, where he was trying to appropriate an office then filled by Colonel Hardin—was his future antagonist, Stephen A. Douglas. Neither seemed to have any presentiment of the future greatness of the other. Douglas thought little of the raw youth from the Sangamon timber, and Lincoln said the dwarfish Vermonter was “the least man he had ever seen.” To all appearance, Vandalia was full of better men than either of them—clever lawyers, men of wit and standing, some of them the sons of provident early settlers, but more who had come from older States to seek their fortunes in these fresh fields.

During his first session Lincoln occupied no especially conspicuous position. He held his own respectably among the best. One of his colleagues tells us he was not distinguished by any external eccentricity; that he wore, according to the custom of the time, a decent suit of blue jeans; that he was known simply as a rather quiet young man, good-natured and sensible. Before the session ended he had made the acquaintance of most of the members, and had evidently come to be looked upon as possessing more than ordinary capacity. His unusual common-sense began to be recognized. His name does not often appear in the records of the year. He introduced a resolution in favor of securing to the State a part of the proceeds of the sales of public lands within its limits; he took part in the organization of the ephemeral “White”

party, which was designed to unite all the anti-Jackson elements under the leadership of Hugh L. White, of Tennessee; he voted with the minority in favor of Young against Robinson for senator, and with the majority that passed the Bank and Canal bills, which were received with such enthusiasm throughout Illinois, and which were only the precursors of those gigantic and ill-advised schemes that came to maturity two years later, and inflicted such incalculable injury upon the State.

Lincoln returned to New Salem, after this winter's experience of men and things at the little capital, much firmer on his feet than ever before. He had had the opportunity of measuring himself with the leading men of the community, and had found no difficulty whatever in keeping pace with them. He continued his studies of the law and surveying together, and became quite indispensable in the latter capacity—so much so that General Neale, announcing in September, 1835, the names of the deputy surveyors of Sangamon County, places the name of Lincoln before that of his old master in the science, John Calhoun. He returned to the Legislature in the winter of 1835-6, and one of the first important incidents of the session was the election of a senator to fill the vacancy occasioned by the death of Elias Kent Kane. There was no lack of candidates. A journal of the time says: "This intelligence reached Vandalia on the evening of the 26th December, and in the morning nine candidates appeared in that place, and it was anticipated that a number more would soon be in, among them 'the lion of the North,' who, it is thought, will claim the office by preëmption."* It is not known who was the roaring celebrity here referred to, but the successful candidate was General William L. D. Ewing, who was elected by a majority of one vote. Lincoln and the other Whigs voted for him, not because he was a "White" man, as they frankly stated, but because "he had been proscribed by the Van Buren party." Mr. Semple, the candidate of the regular Democratic caucus, was beaten simply on account of his political orthodoxy.

A minority is always strongly in favor of independent action and bitterly opposed to caucuses, and therefore we need not be surprised at finding Mr. Lincoln, a few days later in the session, joining in hearty denunciation of the convention system, which had already become popular in the East, and which General Jackson was then urging upon his faithful followers. The missionaries of this new system in Illinois were the shifty young lawyer from Morgan County, who had just

* "Sangamon Journal," January 2.

succeeded in having himself made circuit attorney in place of John J. Hardin, Stephen A. Douglas, recently from Vermont, and a man who was then regarded in Vandalia as a far more important and dangerous person than Douglas, Ebenezer Peck, of Chicago. He was looked upon with distrust and suspicion for several reasons, all of which seemed valid to the rural legislators assembled there. He came from Canada, where he had been a member of the provincial parliament, and was therefore imagined to be permeated with secret hostility to republican institutions; his garb, his furs, were of the fashion of Quebec; and he passed his time indoctrinating the Jackson men with the theory and practice of party organization, teachings which they eagerly absorbed, and which seemed sinister and ominous to the Whigs. He was showing them, in fact, the way in which elections were to be won; and though the Whigs denounced his system as subversive of individual freedom and private judgment, it was not long before they were also forced to adopt it, or be left alone with their virtue. The organization of political parties in Illinois really takes its rise from this time, and in great measure from the work of Mr. Peck with the Vandalia Legislature. There was no man more dreaded and disliked than he was by the stalwart young Whigs against whom he was organizing that solid and disciplined opposition. But a quarter of a century brings wonderful changes. Twenty-five years later Mr. Peck stood shoulder to shoulder with these very men who then reviled him as a Canadian emissary of tyranny and corruption,—with S. T. Logan, Browning, and Dubois,—organizing a new party for victory under the name of Abraham Lincoln.

The Legislature adjourned on the 23d of January, having made a beginning, it is true, in the work of improving the State by statute, though its modest work, incorporating canal and bridge companies and providing for public roads, bore no relation to the ambitious essays of its successor. Among the bills passed at this session was an Apportionment act, by which Sangamon County became entitled to seven representatives and two senators, and early in the spring nine statesmen of the county were ready for the field. It seems singular to us of a later day that just nine prominent men should have offered themselves for these places, without the intervention of any primary meetings. Such a thing, if we mistake not, was never known again in Illinois. The convention system was afterwards seen to be an absolute necessity to prevent the disorganization of parties through the restless vanity of obscure and insubordinate aspirants. But the nine who "took the stump" in San-

gamon in the summer of 1836 were supported as loyally and as energetically as if they had been nominated with all the solemnity of modern days. They became famous in the history of the State, partly for their stature and partly for their influence in legislation. They were called the "Long Nine"; their average height was over six feet, and their aggregate altitude was said to have been fifty-five feet. Their names were Abraham Lincoln, John Dawson, Dan Stone, Ninian W. Edwards, William F. Elkin, R. L. Wilson, Andrew McCormick: these were candidates for the House of Representatives, and Job Fletcher and Archer Herndon for the State Senate.

Mr. Lincoln began his canvass with the following circular:

"NEW SALEM, June 13, 1836.

"To the Editor of the 'Journal.'

"In your paper of last Saturday I see a communication over the signature 'Many Voters' in which the candidates who are announced in the 'Journal' are called upon to 'show their hands.' Agreed. Here's mine.

"I go for all sharing the privileges of the Government who assist in bearing its burdens. Consequently I go for admitting all whites to the right of suffrage who pay taxes or bear arms (by no means excluding females).

"If elected, I shall consider the whole people of Sangamon my constituents, as well those that oppose as those that support me.

"While acting as their representative I shall be governed by their will on all subjects upon which I have the means of knowing what their will is, and upon all others I shall do what my own judgment teaches me will best advance their interests. Whether elected or not, I go for distributing the proceeds of the sales of the public lands to the several States, to enable our State, in common with others, to dig canals and construct railroads without borrowing money and paying interest on it.

"If alive on the first Monday in November, I shall vote for Hugh L. White for President.*

"Very respectfully,
"A. LINCOLN."

It would be hard to imagine a more audacious and unqualified declaration of principles and intentions. But it was the fashion of the hour to promise exact obedience to the will of the people, and the two practical questions touched by this circular were the only ones then much talked about. The question of suffrage for aliens was a living problem in the State, and Mr. Lincoln naturally took liberal ground on it; and he was also in favor of getting from the sale of public lands a portion of the money he was ready to vote for internal improvements. This was good Whig doctrine at that time, and the young politician did not fancy he could go wrong in following in such a matter the lead of his idol, Henry Clay.

* This phrase seems to have been adopted as a formula by the anti-Jackson party. The "cards" of several candidates contain it.

He made an active canvass, and spoke frequently during the summer. He must have made some part of the campaign on foot, for we find in the county paper an advertisement of a horse which had strayed or been stolen from him while on a visit to Springfield. It was not an imposing animal, to judge from the description; it was "plainly marked with harness," and was "believed to have lost some of his shoes"; but it was a large horse, as suited a cavalier of such stature, and "trotted and paced" in a serviceable manner. In July a rather remarkable discussion took place at the county seat, in which many of the leading men on both sides took part. Mr. Ninian Edwards, son of the late Governor, is said to have opened the debate with much effect. Mr. Early, who followed him, was so roused by his energetic attack that he felt his only resource was a flat contradiction, which in those days meant mischief. In the midst of great and increasing excitement Dan Stone and John Calhoun made speeches which did not tend to pour oil on the waters of contention, and then it came to Mr. Lincoln's turn. An article in the "Journal" states that he seemed embarrassed in his opening, for this was the most important contest in which he had ever been engaged. But he soon felt his easy mastery of his powers come back to him, and finished by making what was universally regarded as the strongest speech of the day. One of his colleagues says that on this occasion he used in his excitement for the first time that singularly effective clear tenor tone of voice which afterwards became so widely known in the political battles of the West.

The canvass was an energetic one throughout, and excited more interest in the district than even the presidential election which occurred some months later. Mr. Lincoln was elected at the head of the poll by a majority greatly in excess of the average majority of his friends, which shows conclusively how his influence and popularity had increased. The Whigs in this election effected a revolution in the politics of the county. By force of their ability and standing they had before managed to divide the suffrages of the people, even while they were unquestionably in the minority; but this year they completely defeated their opponents and gained that control of the county which they never lost as long as the party endured.

BEDLAM LEGISLATION.

If Mr. Lincoln had no other claims to be remembered than his services in the Legislature of 1836-7, there would be little to say in his favor. Its history is one of disaster to the

State. Its legislation was almost wholly unwise and hurtful. The most we can say for Mr. Lincoln is that he obeyed the will of his constituents, as he promised to do, and labored with singular skill and ability to accomplish the objects desired by the people who gave him their votes. The especial work intrusted to him was the subdivision of the county, and the project for the removal of the capital of the State to Springfield.* In both of these he was successful. In the account of errors and follies committed by the Legislature to the lasting injury of the State, he is entitled to no praise or blame beyond the rest. He shared in that sanguine epidemic of financial and industrial quackery which devastated the entire community, and voted with the best men of the country in favor of schemes which appeared then like a promise of an immediate millennium, and seem now like midsummer madness.

He entered political life in one of those eras of delusive prosperity which so often precede great financial convulsions. The population of the State was increasing at the enormous rate of two hundred per centum in ten years. It had extended northward along the lines of the wooded valleys of creeks and rivers in the center to Peoria; on the west by the banks of the Mississippi to Galena; on the east with wide intervals of wilderness to Chicago.† The edge of the timber was everywhere pretty well occupied, though the immigrants from the forest States of Kentucky and Tennessee had as yet avoided the prairies. The rich soil and equable climate were now attracting an excellent class of settlers from the older States, and the long-neglected northern counties were receiving the attention they deserved. The war of Black Hawk had brought the country into notice; the utter defeat of his nation had given the guarantee of a permanent peace; the last lodges of the Pottawatomies had disappeared from the country in 1833.‡ The money spent by the General Government during the war, and paid to the volunteers at its close, added to the common prosperity. There was a brisk trade in real estate, and there was even a beginning in Chicago of that passion for speculation in town lots which afterwards became a frenzy.

It was too much to expect of the Illinois Legislature that it should understand that the best thing it could do to forward this prosperous tendency of things was to do nothing; for this is a lesson which has not yet been learned by any legislature in the world. For several years they had been tinkering, at first modestly and tentatively, at a scheme of

internal improvements which should not cost too much money. In 1833 they began to grant charters for railroads, which remained in embryo, as the stock was never taken. Surveys for other railroads were also proposed, to cross the State in different directions; and the project of uniting Lake Michigan with the Illinois River by a canal was of too evident utility to be overlooked. In fact, the route had been surveyed, and estimates of cost made, companies incorporated, and all preliminaries completed many years before, though nothing further had been done, as no funds had been offered from any source. But at the special session of 1835 a law was passed authorizing a loan of half a million dollars for this purpose; the loan was effected by Governor Duncan the following year, and in June a board of canal commissioners having been appointed, a beginning was actually made with pick and shovel.

A restless feeling of hazardous speculation seemed to be taking possession of the State. "It commenced," says Governor Ford, in his admirable chronicle,§ "at Chicago, and was the means of building up that place in a year or two from a village of a few houses to be a city of several thousand inhabitants. The story of the sudden fortunes made there excited at first wonder and amazement; next, a gambling spirit of adventure; and lastly, an all-absorbing desire for sudden and splendid wealth. Chicago had been for some time only one great town-market. The plots of towns for a hundred miles around were carried there to be disposed of at auction. The Eastern people had caught the mania. Every vessel coming west was loaded with them, their money and means, bound for Chicago, the great fairy-land of fortunes. But as enough did not come to satisfy the insatiable greediness of the Chicago sharpers and speculators, they frequently consigned their wares to Eastern markets. In fact, lands and town lots were the staple of the country, and were the only articles of export." The contagion spread so rapidly, towns and cities were laid out so profusely, that it was a standing joke that before long there would be no land left in the State for farming purposes.

The future of the State for many years to come was thus discounted by the fervid imaginations of its inhabitants. "We have every requisite of a great empire," they said, "except enterprise and inhabitants," and they thought that a little enterprise would bring the inhabitants. Through the spring and summer of 1836 the talk of internal improve-

* Lincoln was at the head of the project to remove the seat of government to Springfield; it was entirely intrusted to him to manage. The members were all

elected on one ticket, but they all looked to Lincoln as the head.—STEPHEN T. LOGAN. † Ford, p. 102.

‡ Reynolds's "Life and Times." § Ford, p. 181.

ments grew more general and more clamorous. The candidates for office spoke about little else, and the only point of emulation among the parties was which should be the more reckless and grandiose in its promises. When the time arrived for the assembling of the Legislature, the members were not left to their own zeal and the recollection of their campaign pledges, but meetings and conventions were everywhere held to spur them up to the fulfillment of their mandate. The resolutions passed by the principal body of delegates who came together in December directed the Legislature to vote a system of internal improvements "commensurate with the wants of the people," a phrase which is never lacking in the mouth of the charlatan or the demagogue.

These demands were pressed upon a not reluctant Legislature. They addressed themselves at once to the work required of them, and soon devised, with reckless and unreasoning haste, a scheme of railroads covering the vast uninhabited prairies as with a gridiron. There was to be a railroad from Galena to the mouth of the Ohio River; from Alton to Shawneetown; from Alton to Mount Carmel; from Alton to the eastern State boundary—by virtue of which lines Alton was to take the life of St. Louis without further notice; from Quincy to the Wabash River; from Bloomington to Pekin; from Peoria to Warsaw;—in all, one thousand three hundred and fifty miles of railway. Some of these terminal cities were not in existence except upon neatly designed surveyors' maps. The scheme provided also for the improvement of every stream in the State on which a child's shingle-boat could sail; and to the end that all objections should be stifled on the part of those neighborhoods which had neither railroads nor rivers, a gift of two hundred thousand dollars was voted to them, and with this sop they were fain to be content and not trouble the general joy. To accomplish this stupendous scheme, the Legislature voted eight million dollars, to be raised by loan.* Four millions were also voted to complete the canal. These sums, monstrous as they were, were still ridiculously inadequate to the purpose in view. But while the frenzy lasted there was no consideration of cost or of possibilities. These vast works were voted without estimates, without surveys, without any rational consideration of their necessity. The voice of reason seemed to be silent in the Assembly; only the utterances of fervid prophecy found listeners. Governor Ford speaks of one orator who insisted, amid enthusiastic plaudits, that the State could well afford to borrow one hundred millions for internal im-

provements. The process of reasoning, or rather predicting, was easy and natural. The roads would raise the price of land; the State could enter large tracts and sell them at a profit; foreign capital would be invested in land, and could be heavily taxed to pay bonded interest; and the roads, as they were built, could be operated at a great profit to pay for their own construction. The climax of the whole folly was reached by the provision of law directing that work should be begun at once at the termini of all the roads and the crossings of all rivers.

It is futile and disingenuous to attempt, as some have done, to fasten upon one or the other of the political parties of the State the responsibility of this bedlam legislation. The Governor and a majority of the Legislature were elected as Jackson Democrats, but the Whigs were as earnest in passing these measures as their opponents; and after they were adopted, the superior wealth, education, and business capacity of the Whigs had their legitimate influence, and they filled the principal positions upon the boards and commissions which came into existence under the acts. The bills were passed by a large majority, and the news was received by the people of the State with the most extravagant demonstrations of delight. The villages were illuminated; bells were rung in the rare steeples of the churches; "fire-balls," bundles of candle-wick soaked in turpentine, were thrown by night all over the country. The day of payment was far away, and those who trusted the assurances of the sanguine politicians thought that in some mysterious way the scheme would pay for itself.

Mr. Lincoln is continually found voting with his friends in favor of this legislation, and there is nothing to show that he saw any danger in it. He was a Whig, and as such in favor of internal improvements in general and a liberal construction of constitutional law in such matters. As a boy, he had interested himself in the details of local improvements of rivers and roads, and he doubtless went with the current in Vandalia in favor of this enormous system. He took, however, no prominent part in the work by which these railroad bills were passed. He considered himself as specially commissioned to procure the removal of the State capital from Vandalia to Springfield, and he applied all his energies to the accomplishment of this work. The enterprise was hedged around with difficulties; for although it was everywhere agreed, except at Vandalia, that the capital ought to be moved, every city in the State, and several which existed only on paper, demanded to be made the seat of government. The ques-

* Ford's "History," p. 184.

tion had been submitted to a popular vote in 1834, and the result showed about as many cities desirous of opening their gates to the Legislature as claimed the honor of being the birth-place of Homer. Of these Springfield was only third in popular estimation, and it was evident that Mr. Lincoln had need of all his wits if he were to fulfill the trust confided to him. It is said by Governor Ford that the "Long Nine" were not averse to using the hopes and fears of other members in relation to their special railroads to gain their adherence to the Springfield programme, but this is by no means clear. We are rather inclined to trust the direct testimony of Mr. Jesse K. Dubois, that the success of the Sangamon County delegation in obtaining the capital was due to the adroit management of Mr. Lincoln — first in inducing all the rival claimants to unite in a vote to move the capital from Vandalia, and then in carrying a direct vote for Springfield through the joint convention by the assistance of the southern counties. His personal authority accomplished this in great part. Mr. Dubois says, "He made Webb and me vote for the removal, though we belonged to the southern end of the State. We defended our vote before our constituents by saying that necessity would ultimately force the seat of government to a central position. But in reality we gave the vote to Lincoln because we liked him, because we wanted to oblige our friend, and because we recognized him as our leader." To do this, they were obliged to quarrel with their most intimate associates, who had bought a piece of waste land at the exact geographical center of the State and were striving to have the capital established there in the interest of their own pockets and territorial symmetry.

The bill was passed only a short time before the Legislature adjourned, and the "Long Nine" came back to their constituents, wearing their well-won laurels. They were complimented in the newspapers, at public meetings, and even at subscription dinners. We read of one at Springfield, at the "Rural Hotel," to which sixty guests sat down, where there were speeches by Browning, Lincoln, Douglas (who had resigned his seat in the Legislature to become Register of the Land Office at the new capital), S. T. Logan, Baker, and others, whose wit and wisdom were lost to history through the absence of reporters. Another dinner was given them at Athens a few weeks later. Among the toasts on these occasions were two which we may transcribe:

VOL. XXXIII.—36.

HON. O. H. BROWNING. (FROM A PHOTOGRAPH BY WAIDE.)

"Abraham Lincoln: He has fulfilled the expectations of his friends, and disappointed the hopes of his enemies"; and "A. Lincoln: One of Nature's noblemen."

THE LINCOLN-STONE PROTEST.

ON the 3d of March, the day before the Legislature adjourned, Mr. Lincoln caused to be entered upon its records a paper which excited but little interest at the time, but which will probably be remembered long after the good and evil actions of the Vandalia Assembly have faded away from the minds of men. It was the authentic record of the beginning of a great and momentous career.

The following protest was presented to the House, which was read and ordered to be spread on the journals, to wit:

"Resolutions upon the subject of domestic slavery having passed both branches of the General Assembly at its present session, the undersigned hereby protest against the passage of the same.

"They believe that the institution of slavery is founded on both injustice and bad policy, but that the promulgation of abolition doctrines tends rather to increase than abate its evils.

"They believe that the Congress of the United States has no power under the Constitution to interfere with the institution of slavery in the different States.

"They believe that the Congress of the United States has the power, under the Constitution, to abolish slavery in the District of Columbia, but that the

JUDGE STEPHEN T. LOGAN. (FROM THE PORTRAIT IN POSSESSION OF HIS DAUGHTER, MRS. L. H. COLEMAN.)

power ought not to be exercised, unless at the request of the people of the District.

"The difference between these opinions and those contained in the above resolutions is their reason for entering this protest.

(Signed)

"DAN STONE,
"A. LINCOLN,"

"Representatives from the county of Sangamon."

It may seem strange to those who shall read these pages that a protest so mild and cautious as this should ever have been considered either necessary or remarkable. We have gone so far away from the habits of thought and feeling prevalent at that time that it is difficult to appreciate such acts at their true value. But if we look a little carefully into the state of politics and public opinion in Illinois in the first half of this century, we shall see how much of inflexible conscience and reason there was in this simple protest.

The whole of the North-west Territory had, it is true, been dedicated to freedom by the ordinance of 1787, but in spite of that famous prohibition slavery existed in a modified form throughout that vast territory wherever there was any considerable population. An act legalizing a sort of slavery by indenture was

passed by the Indiana territorial Legislature in 1807,* and this remained in force in the Illinois country after its separation. Another act providing for the hiring of slaves from Southern States was passed in 1814, for the ostensible reason that "mills could not be successfully operated in the territory for want of laborers, and that the manufacture of salt could not be successfully carried on by white laborers."† Yet, as an unconscious satire upon such pretenses, from time to time the most savage acts were passed to prohibit the immigration of free negroes into the territory which was represented as pining for black labor. Those who held slaves under the French domination, and their heirs, continued to hold them and their descendants in servitude after Illinois had become nominally a free territory and a free State, on the ground that their vested rights of property could not have been abrogated by the ordinance, and under the rule of the civil law *partus sequitur ventrem*.

But this quasi-toleration of the institution

* Edwards, p. 179.

† Edwards, p. 180.

was not enough for the advocates of slavery. Soon after the adoption of the State Constitution, which prohibited slavery "hereafter," it was evident that there was a strong undercurrent of desire for its introduction into the State. Some of the leading politicians, exaggerating the extent of this desire, imagined they saw in it a means of personal advancement, and began to agitate the question of a convention to amend the Constitution. At that time there was a considerable emigration setting through the State from Kentucky and Tennessee to Missouri. Day by day the teams of the movers passed through Illinois settlements, and wherever they halted for rest and refreshment they would affect to deplore the short-sighted policy which, by prohibiting slavery, had prevented their settling in that beautiful country. When young bachelors came from Kentucky on trips of business or pleasure, they dazzled the eyes of the women and excited the envy of their male rivals with their black retainers. The early Illinoisians were perplexed with a secret and singular sense of inferiority to even so new and raw a community as Missouri, because of its possession of slavery. Governor Edwards, complaining so late as 1829 of the superior mail facilities afforded to Missouri, says: "I can conceive of no reason for this preference, unless it be supposed that because the people of Missouri have negroes to work for them they are to be considered as gentlefolks entitled to higher consideration than us plain 'free-State' folks who have to work for ourselves."

The attempt was at last seriously made to open the State to slavery by the Legislature of 1822-3. The Governor, Edward Coles of Virginia, a strong anti-slavery man, had been

Elijah P. Lovejoy

(FROM SILHOUETTE IN POSSESSION OF HIS SISTER.)

elected by a division of the pro-slavery party, but came in with a Legislature largely against him. The Senate had the requisite pro-slavery majority of two-thirds for a convention. In the House of Representatives there was a contest for a seat upon the result of which the two-thirds majority depended. The seat was claimed by John Shaw and Nicholas Hanson, of Pike County. The way in which the contest was decided affords a curious illustration of the moral sense of the advocates of slavery. They wanted at this session to elect a senator and provide for the convention. Hanson would vote for their senator and not for the convention. Shaw would vote for the convention, but

HON. JOHN T. STUART.
(FROM THE DAGUERRETYPE IN POSSESSION OF HIS WIFE.)

not for Thomas, their candidate for senator. In such a dilemma they determined not to choose, but impartially to use both. They gave the seat to Hanson, and with his vote elected Thomas; they then turned him out, gave the place to Shaw, and with his vote carried the act for submitting the convention question to a popular vote. They were not more magnanimous in their victory than scrupulous in the means by which they had gained it. The night after the vote was taken they formed in a wild and drunken procession, and visited the residences of the Governor and the other free-State leaders, with loud and indecent demonstrations of triumph.

They considered their success already assured; but they left out of view the value of the moral forces called into being by their insolent challenge. The better class of people in the State, those heretofore unknown in politics, the schoolmasters, the ministers, immediately prepared for the contest, which became one of the severest the State has ever known. They established three newspapers, and sustained them with money and contributions. The Governor gave his entire salary for four years to the expenses of this contest, in

which he had no personal interest whatever. The anti-slavery members of the Legislature made up a purse of a thousand dollars. They spent their money mostly in printer's ink and in the payment of active and zealous colporteurs. The result was an overwhelming defeat for the slave party. The convention was beaten by eighteen hundred majority, in a total vote of 11,612, and the State saved forever from slavery.

But these supreme efforts of the advocates of public morals, uninfluenced by considerations of personal advantage, are of rare occurrence, and necessarily do not survive the exigencies that call them forth. The apologists of slavery, beaten in the canvass, were more successful in the field of social opinion. In the reaction which succeeded the triumph of the anti-slavery party, it seemed as if there had never been any anti-slavery sentiment in the State. They had voted, it is true, against the importation of slaves from the South, but they were content to live under a code of Draconian ferocity, inspired by the very spirit of slavery, visiting the immigration of free negroes with penalties of the most savage description.

Even Governor Coles, the public-spirited and popular politician, was indicted and severely fined for having brought his own freedmen into the State and having assisted them in establishing themselves around him upon farms of their own. The Legislature remitted the fine, but the Circuit Court declared it had no constitutional power to do so, though the Supreme Court afterwards overruled this decision. Any mention of the subject of slavery was thought in the worst possible taste, and no one could avow himself opposed to it without the risk of social ostracism. Every town had its one or two abolitionists, who were regarded as harmless or dangerous lunatics, according to the energy with which they made their views known.

From this arose a singular prejudice against New England people. It was attributable partly to the natural feeling of distrust of strangers which is common to ignorance and provincialism, but still more to a general suspicion that all Eastern men were abolitionists. Mr. Cook, who so long represented the State in Congress, used to relate with much amusement how he once spent the night in a farmer's cabin, and listened to the honest man's denunciations of that — Yankee Cook. Cook was a Ken-

tuckian, but his enemies could think of no more dreadful stigma to apply to him than that of calling him a Yankee. Senator McDougal once told us that although he made no pretense of concealing his Eastern nativity, he never could keep his ardent friends in Pike County from denying the fact and fighting any one who asserted it. The great preacher, Peter Cartwright, used to denounce Eastern men roundly in his sermons, calling them "imps who lived on oysters" instead of honest corn-bread and bacon. The taint of slavery, the contagion of a plague they had not quite escaped, was on the people of Illinois. They were strong enough to rise once in their might and say they would not have slavery among them. But in the petty details of every day, in their ordinary talk, and in their routine legislation, their sympathies were still with the slave-holders. They would not enlist with them, but they would fight their battles in their own way.

Their readiness to do what came to be called later, in a famous speech, the "dirty work" of the South was seen in the tragic death of Lovejoy, which occurred in this very year of 1837. He had for some years been publishing a religious newspaper in St. Louis, but finding the atmosphere of that city becoming dangerous to him on account of the freedom of his comments upon their institutions, he moved to Alton, in Illinois, a few miles further up the river. His arrival excited an immediate tumult in that place; a mob gathered there on the day of his arrival — it was Sunday, and the good people were at leisure — and threw his press into the Mississippi. Having thus expressed their determination to vindicate the law, they held a meeting, and cited him before it to declare his intentions. He said they were altogether peaceful and legal; that he intended to publish a religious newspaper and not meddle with politics. This seemed satisfactory to the people, and he was allowed to fish out his press, buy new types, and set up his paper. But Mr. Lovejoy was a predestined martyr. He felt there was a "woe" upon him if he held his peace against the wickedness across the river. He wrote and published what was in his heart to say, and Alton was again vehemently moved. A committee appointed itself to wait upon him; for this sort of outrage is usually accomplished with a curious formality which makes it seem to the participants legal and orderly. The preacher met them with an undaunted front and told them he must do his duty as it appeared to him; that he was amenable to law, but nothing else; he even spoke in condemnation of mobs. Such language "from a minister of the gospel" shocked and

infuriated the committee and those whom they represented. "The people assembled," says Governor Ford, "and quietly took the press and types and threw them into the river." We venture to say that the word "quietly" never before found itself in such company. It is not worth while to give the details of the bloody drama that now rapidly ran to its close. There was a futile effort at compromise, which to Lovejoy meant merely surrender, and which he firmly rejected. The threats of the mob were answered by defiance from the little band that surrounded the abolitionist. A new press was ordered, and arrived, and was stored in a warehouse, where Lovejoy and his friends shut themselves up, determined to defend it with their lives. They were there besieged by the infuriated crowd, and after a short interchange of shots Lovejoy was killed, his friends dispersed, and the press once more — and this time finally — thrown into the turbid flood.

These events took place in the autumn of 1837, but they indicate sufficiently the temper of the people of the State in the earlier part of the year. There was no sympathy nor even toleration for any public expression of hostility to slavery. The zeal of the followers of Jackson, although he had ceased to be President, had been whetted by his public denunciations of the anti-slavery propaganda; little more than a year before he had called upon Congress to take measures to "prohibit under severe penalties" the further progress of such incendiary proceedings as were "calculated to stimulate the slaves to insurrection and to produce all the horrors of civil war." But in spite of all this, the people with uneasy consciences continued to write and talk and petition Congress against slavery, and most of the State Legislatures began to pass resolutions denouncing them. Those passed by the Illinois Legislature have not been recorded, but they were doubtless as vehement as possible, for a Legislature so deeply engaged in financial legerdemain as this never fails to denounce with especial energy anything likely to injure the prospects of trade. The resolutions went the way of all buncombe; the sound and fury of them have passed away into silence; but they woke an echo in one sincere heart which history will be glad to perpetuate.

There was no reason that Abraham Lincoln should take especial notice of these resolutions, more than another. He had done his work at this session in effecting the removal of the capital. He had only to shrug his shoulders at the violence and untruthfulness of the majority, vote against them, and go back to his admiring constituents, to his dinners and his toasts. But his conscience

and his reason forbade him to be silent; he felt a word must be said on the other side to redress the distorted balance. He wrote his protest, saying not one word he was not ready to stand by then and thereafter, wasting not a syllable in rhetoric or feeling, keeping close to law and truth and justice. When he had finished it he showed it to some of his colleagues for their adhesion; but one and all refused, except Dan Stone, who was not a candidate for reelection, having retired from politics to a seat on the bench. The risk was too great for the rest to run. Lincoln was twenty-eight years old; after a youth of singular privations and struggles he had arrived at an enviable position in the politics and the society of the State. His intimate friends, those whom he loved and honored, were Browning, Butler, Logan, and Stuart,—Kentuckians all, and strongly averse to any discussion of the question of slavery. The public opinion of his county, which was then little less than the breath of his life, was all the same way. But all these considerations could not withhold him from performing a simple duty—a duty which no one could have blamed him for leav-

ing undone. The crowning grace of the whole act is in the closing sentence: "The difference between these opinions and those contained in the said resolutions is their reason for entering this protest." Reason enough for the Lincolns and Luthers.

He had many years of growth and development before him. There was a long distance to be traversed between the guarded utterances of this protest and the heroic audacity which launched the proclamation of emancipation. But the young man who dared declare, in the prosperous beginning of his political life, in the midst of a community imbued with slave-State superstitions, that "he believed the institution of slavery was founded both on injustice and bad policy,"—attacking thus its moral and material supports, while at the same time recognizing all the constitutional guarantees which protected it,—had in him the making of a statesman and, if need be, a martyr. His whole career was to run in the lines marked out by these words, written in the hurry of a closing session, and he was to accomplish few acts, in that great history which God reserved for him, wiser and nobler than this.

THE SECOND DAY AT GETTYSBURG.

BY THE CHIEF OF ARTILLERY OF THE ARMY OF THE POTOMAC.

ON June 30th General Meade at Taneytown received information that the enemy was advancing on Gettysburg, and corps commanders were at once instructed to hold their commands in readiness to march against him. The next day, July 1st, Meade wrote to Reynolds that telegraphic intelligence from Couch, and the movements reported by Buford, indicated a concentration of the enemy's army either at Chambersburg, or at some point on a line drawn from that place through Heidlersburg to York. Under these circumstances, Meade informed Reynolds that he had not yet de-

cided whether it was his best policy to move to attack before he knew more definitely Lee's point of concentration. He seems, however, soon to have determined not to advance until the movements or position of the enemy gave strong assurance of success; and that if the enemy took the offensive, he would withdraw his own army from its actual positions and form line of battle behind Pipe Creek, between Middleburg and Manchester. The considerations probably moving him to this are not difficult to divine. Examination of the map [see the November CENTURY]

tain passes. As Meade believed Lee's army to be at least equal to his own, all the elements of the problem were in favor of the Pipe Creek line. But Meade's orders for July 1st, drawing his corps towards the threatened flank, carried Reynolds to

will show that such a line would cover Baltimore and Washington in all directions from which Lee could advance and that Westminster, his depot, would be immediately behind him, with short railroad communication to Baltimore. It would, moreover, save much hard marching, and restore to the ranks the thousands of stragglers who did not reach Gettysburg.

From Westminster—which is in Parr's Ridge, the eastern boundary of the valley of the Monocacy—good roads led in all directions, and gave the place the same strategic value for Meade that Gettysburg had for Lee. The new line could not be turned by Lee without imminent danger to his own army, nor could he afford to advance upon Baltimore or Washington, leaving the Army of the Potomac intact behind and so near him;—that would be to invite the fate of Burgoyne. Meade then could safely select a good "offensive-defensive line" behind Pipe Creek and establish himself there, with perfect liberty of action in all directions. Without magazines or assured communications, Lee would have to scatter his army, more or less, in order to subsist it, and so expose it to Meade; or else keep it united, and so starve it, and Meade could compel the latter alternative by simple demonstrations. There would then be but two courses for Lee,—either to attack Meade in his chosen position or to retreat without a battle. The latter, neither the temper of his army nor that of his Government would probably permit. In case of a defeat Meade's line of retreat would be comparatively short, and easily covered, whilst Lee's would be for two marches through an open country before he could gain the moun-

UNION BREASTWORKS ON LITTLE ROUND TOP—BIG ROUND TOP IN THE DISTANCE.
(FROM WAR-TIME PHOTOGRAPHS.)

Gettysburg, and Buford's report hastened this movement. Reynolds, who probably never received the Pipe Creek circular, was eager for the conflict, and his collision with Heth assuming the dimension of a battle, caused an immediate concentration of both armies at Gettysburg. Prior to this, the assembling of Meade's army behind Pipe Creek would have been easy, and all fears of injuring thereby the *morale* of his troops were idle; the Army of the Potomac was of "sterner stuff" than that implies. The battle of July 1st changed the situation. Overpowered by numbers, the First and Eleventh corps had, after hard fighting and inflicting as well as incurring heavy losses, been forced back to Cemetery Hill, which they still held. To have withdrawn them now would have been a retreat, and might have discouraged the Federal, as it certainly would have elated the Confederate troops; especially as injurious reports unjust to both the corps named had been circulated. It would have been to acknowledge a defeat when there was no defeat. Meade therefore resolved to fight at Gettysburg. An ominous dispatch from General Halleck to Meade, that afternoon, suggesting that whilst his tactical arrangements were good, his strategy was

GENERAL G. K. WARREN AT THE SIGNAL STATION ON LITTLE ROUND TOP.
(FROM A SKETCH MADE BY A. R. WAUD AT THE TIME.)

at fault, that he was too far east, that Lee might attempt to turn his left, and that Frederick was preferable as a base to Westminster, probably confirmed Meade in this decision.

In pursuance of his instructions, I had that morning (July 1st) reconnoitered the country behind Pipe Creek for a battle-ground. On my return I found General Hancock at General Meade's tent. He informed me that Reynolds was killed, that a battle was going on at Gettysburg, and that he was under orders to proceed to that place. His instructions were to examine it and the intermediate country for a suitable field, and if his report was favorable the troops would be ordered forward. Before the receipt of Hancock's written report from Cemetery Hill, which was not very encouraging, General Meade had received from others information as to the state of affairs at the front, set his troops in motion towards Gettysburg, afterwards urged them to forced marches, and under his orders I gave the necessary instructions to the Artillery Reserve and Park for a battle there. The move was, under the circumstances, a bold one, and Meade, as we will see, took great risks. We left Taneytown towards eleven P. M., and reached Gettysburg after midnight. Soon after, General Meade, accompanied by General Howard and myself, inspected our lines so far as then occupied, after which he directed me to examine them again in the morning, and to see that the artillery was properly posted. He had thus recognized my "command" of the artillery; indeed, he did not know it had been suspended.

I resumed it, therefore, and continued it to the end of the battle.

At the close of July 1st, Johnson's and Anderson's divisions of the Confederate army were up. Ewell's corps now covered our front from Benner's Hill to the Seminary, his line

BRIGADIER-GENERAL STRONG VINCENT, MORTALLY WOUNDED,
JULY 2D, IN THE STRUGGLE FOR THE ROUND TOPS.
(FROM A PHOTOGRAPH BY BRADY.)

passing through the town—Johnson on the left, Early in the center, Rodes on the right. Hill's corps occupied Seminary Ridge, and early next morning extended its line from the Seminary south nearly to the Peach Orchard on the Emmettsburg road, Trimble—*vice* Pender, wounded—on the left, Anderson on the right, Pettigrew—*vice* Heth, wounded—in reserve. Of Longstreet's corps, McLaws's division and Hood's—except Law's brigade not yet up—camped that night on Marsh Creek, four miles from Gettysburg. His Reserve Artillery did not reach Gettysburg until nine A. M. of the 2d. Pickett's division had been left at Chambersburg as rear-guard, and joined the corps on the night of the 2d.

It had not been General Lee's intention to deliver a general battle whilst so far from his base unless attacked, but he now found himself by the mere force of circumstances committed to one. If it must take place, the sooner the better. His army was now nearly all on the ground, and delay, whilst it could not improve his own position, would certainly better that of his antagonist. Longstreet, indeed, urged General Lee instead of attacking to turn Meade's left, and by interposing between him and Washington, and threatening his communications, to force him to attack the Confederate army in position; but General Lee probably saw that Meade would be under no such necessity; would have no great difficulty in obtaining supplies, and—disregarding the clamor from Washington—could play a waiting game which it would be impossible for Lee to maintain in the open country. He could not advance on Baltimore or Washington with Meade in his rear, nor could his army subsist itself in a hostile region which would soon swarm with additional enemies. His communications could be cut off, for his recommendation to assemble even a small army at Culpepper to cover them and aid him had not been complied with.

A battle was a necessity to Lee, and a de-

feat would be more disastrous to Meade, and less so to himself, at Gettysburg than at any point east of it. With the defiles of the South Mountain range close in his rear, which could

MAJOR-GENERAL DANIEL E. SICKLES. (FROM A WAR-TIME PHOTOGRAPH.)

be easily held by a small force, a safe retreat through the Cumberland Valley was assured, so that his army, once through these passes, would be practically on the banks of the Potomac, at a point already prepared for crossing. Any position east of Gettysburg would deprive him of these advantages. It is more probable that General Lee was influenced by cool calculation of this nature than by hot blood, or that the opening success of a chance battle had thrown him off his balance. Whatever his reasons, he decided to accept the gage of battle offered by Meade, and to attack as soon as practicable. Ewell had made arrangements to take possession of Culp's Hill in the early morning, and his troops were under arms for the purpose by the time General Meade had finished the moonlight inspection

of his lines, when it was ascertained by a reconnoitering party sent out by Johnson, that the hill was occupied and its defenders on the alert; and further, from a captured dispatch from General Sykes to General Slocum, that the Fifth Corps was on the Hanover road only four miles off, and would march at four A. M. for Culp's Hill. Johnson thereupon deferred his attack and awaited Ewell's instructions.

General Lee had, however, during the night determined to attack the Federal left with Longstreet's corps, and now instructed Ewell, so soon as he heard Longstreet's guns, to make a diversion in his favor, to be converted, if opportunity offered, into a real attack.

Early on the morning of July 2d, when nearly all the Confederate army had reached Gettysburg or its immediate vicinity, a large

pecially the night marches, were trying and had caused much straggling.

All this morning Meade was busily engaged personally or by his staff in rectifying his lines, assigning positions to the commands as they came up, watching the enemy, and studying the field, parts of which we have described in general terms, and now refer the reader to the map (page 286) to aid our further description of some necessary even if tedious details. Near the western base of Cemetery Hill is Ziegler's Grove. From this grove the distance nearly due south to the base of the Little Round Top is a mile and a half. A well-defined ridge known as Cemetery Ridge follows this line from Ziegler's for nine hundred yards to another small grove, or clump of trees, where it turns sharply to the east for two hundred

TROSTLE'S FARM, THE SCENE OF THE HARD FIGHTING BY BIGELOW'S NINTH MASSACHUSETTS BATTERY. (FROM A PHOTOGRAPH.)

portion of the Army of the Potomac was still on the road. The Second Corps and Sykes, with two divisions of the Fifth, arrived about seven A. M., Crawford's division not joining until noon; Lockwood's brigade—two regiments from Baltimore—at eight; De Trobriand's and Burling's brigades of the Third Corps, from Emmettsburg, at nine, and the Artillery Reserve and its large ammunition trains from Taneytown at 10:30 A. M. Sedgwick's Sixth Corps, the largest in the army, after a long night march from Manchester, reached Rock Creek at four P. M. The rapidity with which the army was assembled was creditable to it and to its commander. The heat was oppressive, the long marches, es-

yards, then turns south again, and continues in a "direct line" towards Round Top, for seven hundred yards, to "George Weikert's." So far the ridge is smooth and open, in full view of Seminary Ridge opposite, and distant from fourteen hundred to sixteen hundred yards. At Weikert's, this ridge is lost in a large body of rocks, hills, and woods, lying athwart the "direct line" to Round Top, and forcing a bend to the east in the Taneytown road. This rough space also stretches for a quarter of a mile or more *west* of this "direct line," towards Plum Run. Towards the south it sinks into low marshy ground which reaches to the base of Little Round Top, half a mile or more from George Weikert's. The west side of this

MONUMENT OF BIGELOW'S NINTH MASSACHUSETTS BATTERY.
(FROM A PHOTOGRAPH BY TIPTON.)

broken ground was wooded through its whole extent from north to south. Between this wood and Plum Run is an open cleared space three hundred yards wide—a continuation of the open country in front of Cemetery Ridge; Plum Run flows south-easterly towards Little Round Top, then makes a bend to the south-west where it receives a small stream or “branch” from Seminary Ridge. In the angle between these streams is Devil's Den, a bold rocky hill, steep on its eastern face, and prolonged as a ridge to the west. It is five hundred yards due west of Little Round Top, and one hundred feet lower. The northern extremity is composed of huge rocks and boulders, forming innumerable crevices and holes, from the largest of which the hill derives its name. Plum Run valley is here marshy but strewn with similar boulders, and the slopes of the Round Tops are covered with them. These afforded lurking-places for a multitude of sharpshooters whom, from the difficulties of the ground, it was impossible to dislodge, and who were opposed by similar methods on our part; so that at the close

of the battle these hiding-places, and especially the “Den” itself, were filled with dead and wounded men. This kind of warfare was specially destructive to Hazlett's battery on Round Top, as the cannoneers had to expose themselves in firing, and in one case three were shot in quick succession, before the fourth succeeded in discharging the piece. A cross-road between the Taneytown and Emmettsburg roads runs along the northern base of Devil's Den. From its Plum Run crossing to the Peach Orchard is eleven hundred yards. For the first four hundred yards of this distance, there is a wood on the north and a wheat-field on the south of the road, beyond which the road continues for seven hundred yards to the Emmettsburg road along Devil's Den ridge, which slopes on the north to Plum Run, on the south to Plum “Branch.” From Ziegler's Grove the Emmettsburg road runs diagonally across the interval between Cemetery and Seminary ridges, crossing the latter two miles from Ziegler's Grove. From Peach Orchard to Ziegler's is nearly a mile and a half. For half a mile the road runs along a ridge at right angles to that of Devil's Den, which slopes back to Plum Run. The angle at the Peach Orchard is thus formed by the intersection of two bold ridges, one from Devil's Den, the other along the Emmettsburg road. It is distant about six hundred yards from the wood which skirts the whole length of Seminary Ridge and covers the movement of troops between it and Willoughby Run, half a mile beyond. South of the Round Top and Devil's Den ridge the country is open, and the principal obstacles to free movement are the fences—generally of stone—which surround the numerous fields.

TROSTLE'S HOUSE, NEAR WHICH BIGELOW'S BATTERY LOST EIGHTY OUT OF EIGHTY-EIGHT HORSES. (FROM A PHOTOGRAPH.)

SICKLES'S POSITION AT THE PEACH ORCHARD, VIEWED FROM THE EMMETTSBURG ROAD LOOKING SOUTH, THE ROUND TOPS ON THE LEFT.

(This and the other outline sketches were made recently by C. W. Reed, who, during the battle, was with Bigelow's Battery.)

As our troops came up they were assigned to places on the line: the Twelfth Corps, General A. S. Williams,—*vice* Slocum, commanding the right wing,—to Culp's Hill, on Wadsworth's right; Second Corps to Cemetery Ridge: Hays's and Gibbon's divisions, from Ziegler's to the clump of trees, Caldwell's to the short ridge to its left and rear. This ridge had been occupied by the Third Corps, which was now directed to prolong Caldwell's line to Round Top, relieving Geary's division, which had been stationed during the night on the extreme left, with two regiments at the base of Little Round Top. The Fifth Corps was placed in reserve near the Rock Creek crossing of the Baltimore pike; the Artillery Reserve and its large trains were parked in a central position on a cross-road from the Baltimore pike to the Taneytown road; Buford's cavalry, except Merritt's brigade at Emmetsburg, was near Round Top, from which it was ordered that morning to Westminster, thus uncovering our left flank; Kilpatrick's and Gregg's divisions were well out on the right flank, from which, after a brush with Stuart on the evening of the 2d, Kilpatrick was sent next morn-

ing to replace Buford, Merritt being also ordered up to our left.

The morning was a busy and in some respects an anxious one; it was believed that the whole Confederate army was assembled, that it was equal if not superior to our own in numbers, and that the battle would commence before our troops were up. There was a gap in Slocum's line awaiting a division of infantry, and as some demonstrations of Ewell about daylight indicated an immediate attack at that point, I had to draw batteries from other parts of the line—for the Artillery Reserve was just then starting from Taneytown—to cover it until it could be properly filled. Still there was no hostile movement of the enemy, and General Meade directed Slocum to hold himself in readiness to attack Ewell with the Fifth and Twelfth, so soon as the Sixth Corps arrived. After an examination Slocum reported the ground as unfavorable, in which Warren concurred and advised against an attack there. The project was then abandoned, and Meade postponed all offensive operations until the enemy's intentions should be more clearly developed. In the mean time he took precau-

THE "WHEAT-FIELD."

SICKLES'S POSITION AT THE PEACH ORCHARD, VIEWED FROM LONGSTREET'S POSITION ON THE EMMETTSBURG ROAD, LOOKING NORTH.

tionary measures. It was clearly now to his advantage to fight the battle where he was, and he had some apprehension that Lee would attempt to turn his flank, and threaten his communications, just what Longstreet had been advising. In this case it might be necessary to fall back to the Pipe Creek line if possible, or else to follow Lee's movement into the open country. In either case, or in that of a forced withdrawal, prudence dictated that arrangements should be made in advance, and General Meade gave instructions for examining the roads and communications, and to draw up an order of movement which General Butterfield, the chief of staff, seems to have considered an order-absolute for the withdrawal of the army without a battle.

These instructions must have been given early in the morning, for General Butterfield states that it was on his arrival from Taneytown, which place he left at daylight. An order was drawn up accordingly, given to the adjutant-general, and perhaps prepared for issue in case of necessity to corps commanders; but it was not recorded, nor issued, nor even a copy of it preserved. General Meade declared that he never contemplated the issue of such an order unless contingencies made it necessary; and his acts and dispatches during the day were in accordance with his statement. There is one

circumstance pertaining to my own duties which to my mind is conclusive, and I relate it because it may have contributed to the idea that General Meade intended to withdraw from Gettysburg. He came to me that morning before the Artillery Reserve had arrived, and, therefore, about the time that the order was in course of preparation, and informed me that one of the army corps had left its whole artillery ammunition train behind it and that others were also deficient, notwithstanding his orders on that subject. He was very much disturbed, and feared that, taking into account the large expenditure of the preceding day by the First and Eleventh Corps, there would not be sufficient to carry us through the battle. This was not the first nor the last time that I was called upon to meet deficiencies under such circumstances, and I was, therefore, prepared for this, having directed General Tyler, commanding the reserve artillery, whatever else he might leave behind, to bring up every round of ammunition in his trains, and I knew he would not fail me. I had, moreover, on my own responsibility, and unknown to General Hooker, formed a special ammunition column, attached to the Artillery Reserve, carrying twenty rounds per gun, over and above the authorized amount, for every gun in the army, in order to meet such emergencies.

SICKLES'S ANGLE AT THE PEACH ORCHARD, AS SEEN FROM THE ROAD LEADING FROM THE WHEAT-FIELD TO THE PEACH ORCHARD.

ridge [Cemetery] in rear which was also occupied"; and in a previous "outline" report he says: "In front of General Longstreet the enemy held a position [the salient angle at the Peach Orchard] from which, if he could be driven, it was thought our artillery could be used to advantage in assailing the more elevated ground beyond, and thus enable us to gain the crest of the ridge." It would appear from this that General Lee mistook the few troops on the Peach Orchard ridge in the morning for our main line, and that by taking it, and sweeping up the Emmettsburg road under cover of his batteries, he expected to "roll up" our lines to Cemetery Hill. That would be an "oblique order of battle," in which the attacking line, formed obliquely to its opponent, marches directly forward, constantly breaking in the end of his enemy's line and gaining his

rear. General Longstreet was ordered to form the divisions of Hood and McLaws, on Anderson's right, so as to envelop our left and drive it in. These divisions were only three miles off at daylight, and moved early, but there was great delay in forming them for battle, owing principally to the absence of Law's brigade, for which it would have been well to substitute Anderson's fresh division, which could have been replaced by Pettigrew's, then in reserve. There seems to have been no good reason why the attack should not have been made by eight or nine A. M. at the latest, when the Federal Third Corps was not yet all up, nor Crawford's division, nor the Artillery Reserve, nor the Sixth Corps, and our lines still very incomplete. This is one of the cheap criticisms, after all the facts on both sides are known; but it is apt for its purpose, as it shows how great a risk Meade took in abandoning his Pipe Creek line for Gettysburg, on the chances of Lee's army not being yet assembled; and also, that there was no lack of boldness and decision on Meade's part. Indeed his course, from the hour that he took command, had been marked by these qualities.

A suggestive incident is worth recording here. In the course of my inspection of the lines that morning, while passing along Culp's

Hill, I found the men hard at work intrenching, and in such fine spirits as at once to attract attention. One of them finally dropped his work, and, approaching me, inquired if the reports just received were true. On asking what he referred to, he replied that twice word had been passed along the line that General McClellan had been assigned to the command of the army, and the second time

OUTLINE SKETCH OF WEED'S POSITION ON LITTLE ROUND TOP, LOOKING IN THE DIRECTION OF THE PEACH ORCHARD.

it was added that he was on the way to the field and might soon be expected. He continued, "The boys are all jubilant over it, for they know that if *he* takes command everything will go right." I have been told recently by the commander of a Fifth Corps battery, that during the forced march of the preceding night the same report ran through that corps, excited great enthusiasm amongst the men, and renewed their vigor. It was probably from this corps—just arrived—that the report had spread along the line.

On my return to headquarters from this inspection General Meade told me that General Sickles, then with him, wished me to examine a new line, as he thought that assigned to him was not a good one, especially that he could not use his artillery there. I had been as far as Round Top that morning, noticed the unfavorable character of the ground, and, therefore, accompanied Sickles direct to the Peach Orchard, where he pointed out the ridges, already described, as his proposed line. They commanded all the ground behind, as well as in front of them, and together constituted a favorable position for *the enemy* to hold. This was one good reason for our taking possession of it. It would, it is true, in our hands present a salient angle, which generally exposes both

its sides to enfilade fires; but here the ridges were so high that each would serve as a "traverse" for the other, and reduce that evil to a minimum. On the other hand it would so greatly lengthen our line — which in any case must rest on Round Top, and connect with the left of the Second Corps — as to require a larger force than the Third Corps alone to hold it, and it would be difficult to occupy

to the front of the "direct line" than it appeared from the orchard itself. In fact there was a third line between them, which appears, as seen from the orchard, to be continuous with Cemetery Ridge, but is nearly six hundred yards in front of it. This is the open ground east of Plum Run already described, and which may be called the Plum Run line. Its left where it crosses the run abuts rather on

Devil's Den than Round Top; it was commanded by the much higher Peach Orchard crests, and therefore not an eligible line to occupy, although it became of importance during the battle.

As to the other two lines, the choice between them would depend on circumstances. The direct short line through the woods,

THE DEAD IN THE "WHEAT-FIELD," GATHERED FOR BURIAL.
(FROM PHOTOGRAPHS.)

and strengthen the angle if the enemy already held the wood in its front. At my instance General Sickles ordered a couple of companies to ascertain if the wood was occupied.

About this time a cannonade was opened at Cemetery Hill, which indicated an attack there, and as I had examined the Emmettsburg Ridge, I said I would not wait the result of the reconnoissance, but return to headquarters by way of Round Top, and examine that part of the proposed line. As I was leaving, General Sickles asked me if he should move forward his corps. I answered, "Not on my authority; I will report to General Meade for his instructions." I had not reached the Wheat-field when a sharp rattle of musketry showed that the enemy held the wood in front of the Peach Orchard angle.

As I rode back, a view from that direction showed how much farther Peach Orchard was

and including the Round Tops, could be occupied, intrenched, and made impregnable to a front attack. But, like that of Culp's Hill, it would be a purely defensive one, from which, owing to the nature of the ground and the enemy's commanding position on the ridges at the angle, an advance in force would be impracticable. The salient line proposed by General Sickles, although much longer, afforded excellent positions for our artillery; its occupation would cramp the movements of the enemy, bring us nearer his lines, and afford us facilities for taking the offensive. It was in my judgment the better line of the two, provided it were strongly occupied, for it was the only one on the field from which we could have passed from the defensive to the offensive with a prospect of decisive results. But General Meade had not, until the arrival of the Sixth Corps, a sufficient number of troops at his disposal to

risk such an extension of his lines; it would have required both the Third and Fifth Corps, and left him without any reserve. Had he known that Lee's attack would be postponed until four P. M., he might have occupied this line in the morning; but he did not know this, expected an attack at any moment, and in view of the vast interests involved, adopted a defensive policy, and ordered the occupation of the *safe* line. In taking risks, it would not be for his army alone, but also for Philadelphia, Baltimore, and Washington, with the political consequences of their capture. Gettysburg was not a good strategical position for us, and the circumstances under which our army was assembled limited us tactically to a strictly defensive battle.

After finishing my examination I returned to headquarters and briefly reported to General Meade that the proposed line was a good one in itself, that it offered favorable positions for artillery, but that its relations to other lines were such that I could not advise, and suggested that he examine it himself before ordering its occupation. He nodded assent, and I proceeded to Cemetery Hill.

The cannonade there still continued; it had been commenced by the enemy, and was accompanied by some movements of troops towards our right. As soon as I saw that it would lead to nothing serious, I returned direct to the Peach Orchard, knowing that its occupation would require large reinforcements of artillery. I was here met by Captain Randolph, the corps chief of artillery, who informed me that he had been ordered to place his batteries on the new line. Seeing Generals Meade and Sickles, not far off, in conversation, and supposing that General Meade had consented

BRIGADIER-GENERAL SAMUEL K. ZOOK, COMMANDING THE THIRD BRIGADE OF CALDWELL'S DIVISION, KILLED IN THE "WHEAT-FIELD" JULY 2D. (FROM A PHOTOGRAPH BY BRADY.)

to the occupation, I sent at once to the reserve for more artillery, and authorized other general officers to draw on the same source. Here perhaps I may be allowed to say *en passant* that this large reserve, organized by the wise forethought of General McClellan, sometimes threatened with destruction, and once actually broken up, was often, as at Malvern Hill, and now at Gettysburg, an invaluable resource in the time of greatest need. When in 1864 in the Rapidan campaign it was "got rid of," it reconstituted itself, without orders, and in a few weeks, through the necessities of the army, showing that "principles vindicate themselves."

When I arrived Birney's division was already posted on the crest from Devil's Den to the Peach Orchard, and along the Emmettsburg road, Ward's brigade on the left, Graham's at the angle, De Trobriand's connecting them by a thin line. Humphreys's division was on Graham's right, near the Emmettsburg road, Carr's brigade in the front line, about the Smith house, Brewster's in second line. Burling's, with the exception of Sewell's Fifth New Jersey Regiment, then in skirmish order at the front, was sent to reinforce Birney. Seeley's battery, at first posted on the right, was soon after sent to the left of the Smith house, and replaced on the right by Turnbull's from the Artillery Reserve. Randolph had ordered Smith's battery, Fourth New York, to the rocky hill at the Devil's Den; Winslow's to the Wheat-field. He had placed Clark on the crest looking south, and his own ("E," First Rhode Island) near the angle, facing west. The whole corps was, however, too weak for the ground to be covered, and it was too late for Meade to withdraw it. Sykes's Fifth Corps had already been ordered up and was

COLONEL GEORGE L. WILLARD, COMMANDING THE THIRD BRIGADE OF HAYS'S DIVISION, KILLED ON JULY 2D. (FROM A PHOTOGRAPH BY BRADY.)

INSIDE EVERGREEN CEMETERY, CEMETERY HILL.
(BY EDWIN FORBES, AFTER HIS SKETCH MADE AT THE TIME.)

momentarily expected. As soon as fire opened, which was just as he arrived on the ground, General Meade sent also for Caldwell's division from Cemetery Ridge, and a division of the Twelfth Corps from Culp's, and soon after for troops from the Sixth Corps. McGilvery's artillery brigade soon arrived, from the reserve, and Bigelow's, Phillips's, Hart's, Ames's, and Thompson's batteries had been ordered into position on the crests, when the enemy opened from a long line of guns, stretching down to the crossing of the Emmettsburg pike. Smith's position at Devil's Den gave him a favorable oblique fire on a part of this line, and as he did not reply, I proceeded to the Den. Finding the acclivity steep and rocky, I dismounted and tied my horse to a tree before crossing the valley. My rank, brigadier-general, the command being that of a lieutenant-general, gave me a very small and insufficient staff, and even this had been recently cut down. The inspector of artillery Lieutenant-Colonel Warner, adjutant-general Captain Craig, my only aide Lieutenant Bissel, my one orderly, and even the flag-bearer necessary to indicate my presence to those seeking me, were busy conveying orders or messages, and I was alone; a not infrequent and an awkward thing for a general who had to keep up communications with every part of a battle-field and with the general-in-chief. On climbing to the summit, I found that Smith had just got his guns, one by one, over the rocks and chasms, into an excellent position. After pointing out to me the advancing lines of the enemy, he opened, and very effectively. Many guns were immediately turned on him, relieving so far the rest of the line. Telling him he

would probably lose his battery, I left to seek for infantry supports, very doubtful if I would find my horse, for the storm of shell bursting over the place was enough to drive any animal wild. On reaching the foot of the cliff, I found myself in a plight at once ludicrous, painful, and dangerous. A herd of horned cattle had been driven into the valley between Devil's Den and Round Top, from which they could not escape. A shell had exploded in the body of one of them, tearing it to pieces; others were torn and wounded. All were *stampeded*, bellowing and rushing in their terror first to one side, then to the other, to escape the shells that were bursting over and amongst them. Cross I must, and in doing so I had my most trying experience of the battle of Gettysburg. Luckily the poor beasts were as much frightened as I was, but their rage was subdued by terror, and they were good enough to let me pass through scot-free, but "badly demoralized." However, my horse was safe, I mounted, and in the busy excitement that followed almost forgot my scare.

It was not until about four P. M. that Longstreet got his two divisions into position in two lines, McLaws's on the right of Anderson's division of Hill's corps, and opposite the Peach Orchard; Hood's on the extreme Confederate right and crossing the Emmettsburg road. Hood had been ordered, keeping his left on that road, to break in the end of our line, supposed to be at the orchard; but perceiving that our left was "refused" (bent back towards Devil's Den), and noticing the importance of Round Top, he suggested to Longstreet that the latter be turned and attacked. The reply was that General Lee's orders were to attack along the Emmettsburg road. Again Hood sent his message and received the same reply, notwithstanding which he directed Law's brigade upon Round Top, in which movement a portion of Robertson's brigade joined, and the rest of the division was thrown upon Devil's Den and the ridge between it and the Peach Orchard. The first assaults were repulsed, but, after hard fighting, McLaws's division

COLONEL EDWARD E. CROSS, COMMANDING THE FIRST BRIGADE OF CALDWELL'S DIVISION, KILLED NEAR DEVIL'S DEN, JULY 2D. (FROM A PHOTOGRAPH BY BRADY.)

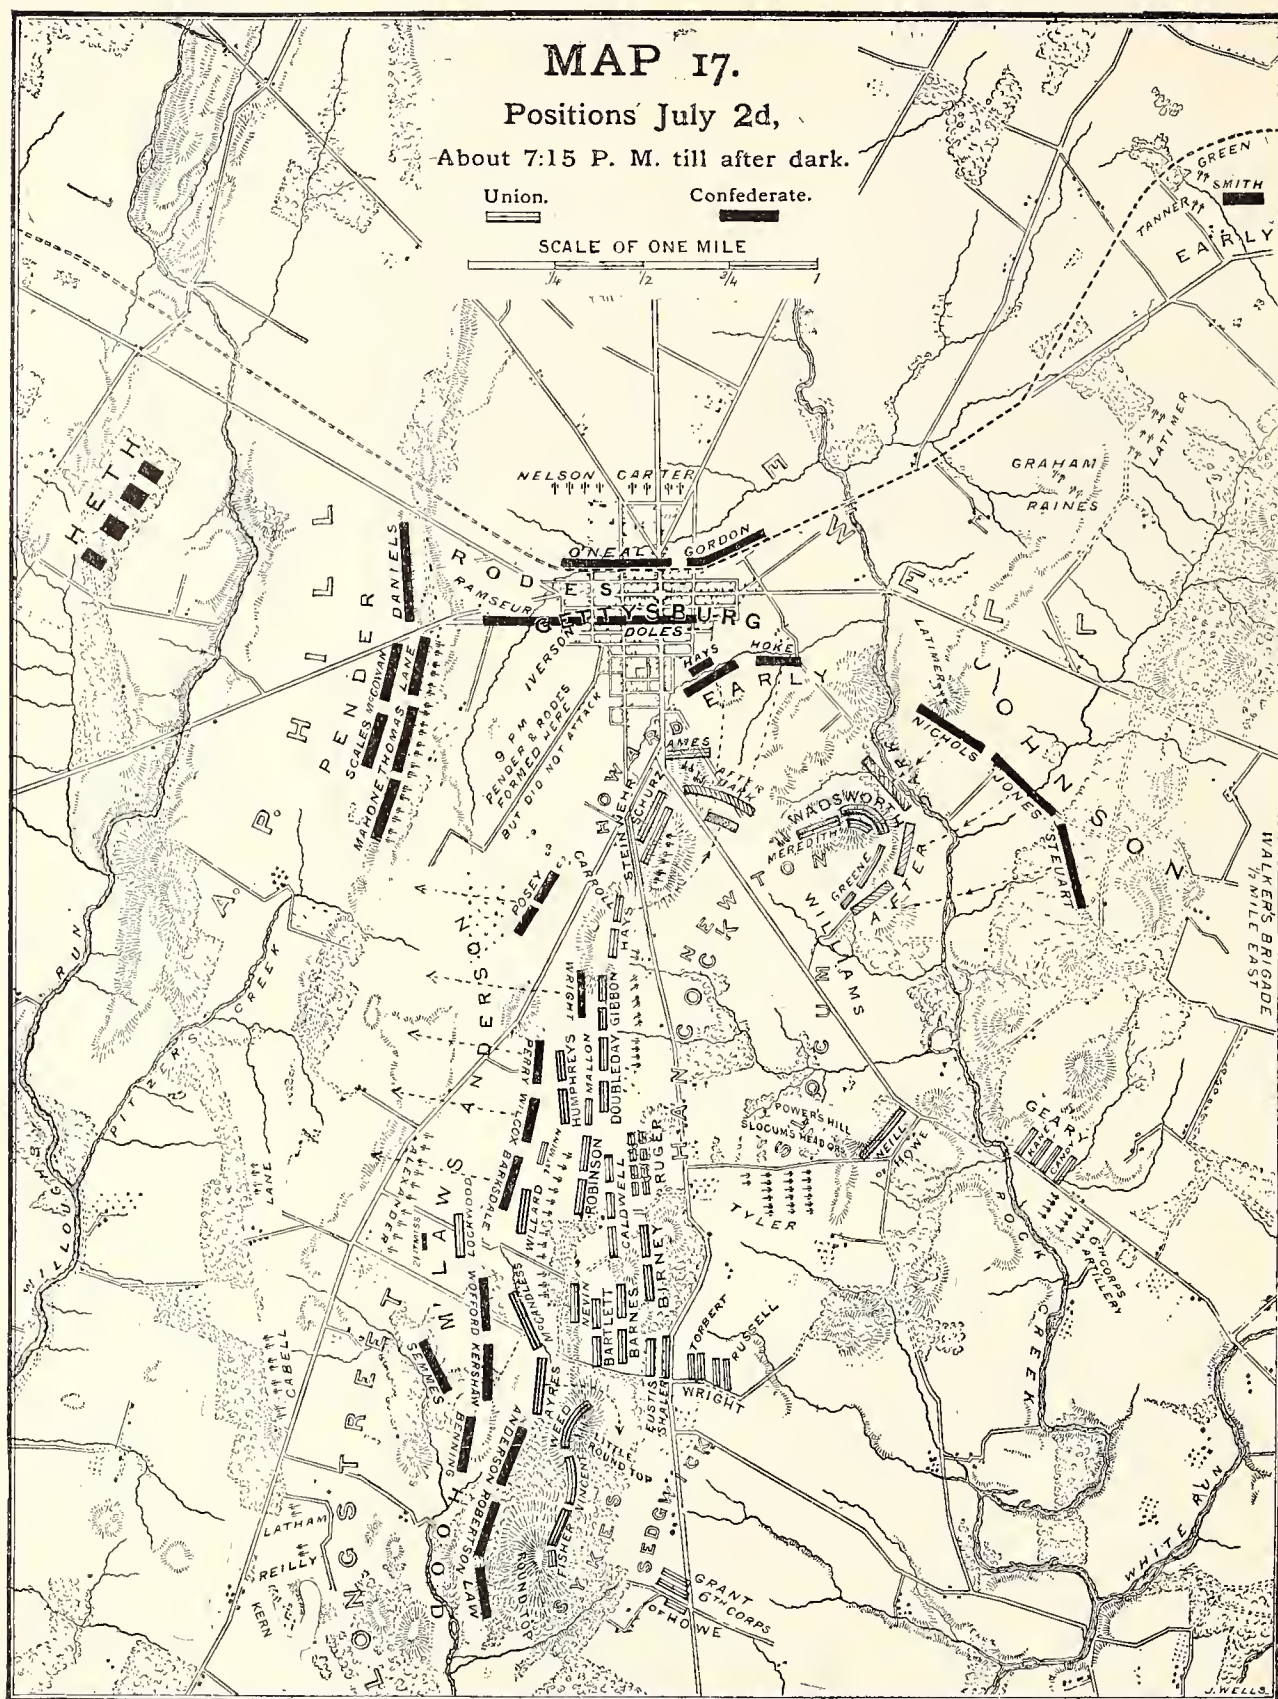

was not effected, and Humphreys, greatly outnumbered, slowly and skillfully fell back to Cemetery Ridge, Gibbon sending two regiments and Brown's Rhode Island battery to his support. But the enemy was strong and covered the whole Second Corps front, now greatly weakened by detachments. Wilcox's, Perry's, and Wright's brigades pressed up to the ridge, outflanking Humphreys's right and left, and Wright broke through our line and seized the guns in his front, but was soon driven out, and not being supported all fell back, about dusk, under a heavy artillery fire.

As soon as Longstreet's attack commenced, General Warren was sent by General Meade to see to Little Round Top. He found it unoccupied by troops, and seeing the advance of Hood's lines, and also the near approach of Sykes's Fifth Corps from Rock Creek, immediately caused Weed's and Vincent's brigades and Hazlett's battery to be detached from the latter and hurried them to the summit. The passage of the six guns through the roadless woods and amongst the rocks was marvelous. Under ordinary circumstances it would have been considered an impossible feat, but the eagerness of the men to get into action with their comrades of the infantry, and the skillful driving, brought them without delay to the very summit, where they went immediately into battle. They were barely in time, for the enemy were also climbing the hill. A close and bloody hand-to-hand struggle ensued, which

being also advanced, the angle was, towards six o'clock, broken in, after a resolute defense and with great loss on both sides. In the mean time three of Anderson's brigades were advancing on Humphreys, and the latter received orders from Birney, now in command of the corps, Sickles being severely wounded soon after six o'clock near the Trostle house, to throw back his left, form an oblique line in his rear, and connect with the right of Birney's division, then retiring. The junction

CONFEDERATE PRISONERS ON THE BALTIMORE PIKE. (BY EDWIN FORBES, AFTER HIS SKETCH MADE AT THE TIME.)

left both Round Tops in our possession. Weed and Hazlett were killed, and Vincent mortally wounded—all young men of great promise. Weed had served with much distinction as an artillerist in the Peninsular, Second Bull Run, and Antietam campaigns, had become chief of artillery of his army corps, and at Chan-

cellorsville showed such special aptitude and fitness for large artillery commands that he was immediately promoted from captain to brigadier-general and transferred to the infantry. Hazlett was killed whilst bending over his former chief, to receive his last message, and Lieutenant Rittenhouse efficiently

commanded the battery during the remainder of the battle.

The enemy, however, clung to the woods and rocks at the base of Round Top, carried Devil's Den and its woods, and captured three of Smith's guns, who, however, effectively deprived the enemy of their use by carrying off all the implements.

The breaking in of the Peach Orchard angle

low's battery was withdrawn, it was closely pressed by Humphries's Twenty-first Mississippi, the only Confederate regiment which succeeded in crossing the run. His men had entered the battery and fought hand-to-hand with the cannoneers; one was killed whilst trying to spike a gun, and another knocked down with a handspike whilst endeavoring to drag off a prisoner. Of the four battery-officers

CONFEDERATE SKIRMISHERS AT THE FOOT OF CULP'S HILL.

exposed the flanks of the batteries on its crests, which retired firing, in order to cover the retreat of the infantry. Many guns of different batteries had to be abandoned because of the destruction of their horses and men; many were hauled off by hand; all the batteries lost heavily. Bigelow's Ninth Massachusetts made a stand close by the Trostle house in the corner of the field through which he had retired fighting with prolonges fixed. Although already much cut up, he was directed by McGilvery to hold that point at all hazards until a line of artillery could be formed in front of the wood beyond Plum Run; that is, on what we have called the "Plum Run line." This line was formed by collecting the serviceable batteries, and fragments of batteries, that were brought off, with which, and Dow's Maine battery fresh from the reserve, the pursuit was checked. Finally some twenty-five guns formed a solid mass, which unsupported by infantry held this part of the line, aided Humphreys's movements, and covered by its fire the abandoned guns on the field until they could be brought off, as all were, except perhaps one. When, after fully accomplishing its purpose, all that was left of Bige-

low's battery was withdrawn, it was closely pressed by Humphries's Twenty-first Mississippi, the only Confederate regiment which succeeded in crossing the run. His men had entered the battery and fought hand-to-hand with the cannoneers; one was killed whilst trying to spike a gun, and another knocked down with a handspike whilst endeavoring to drag off a prisoner. Of the four battery-officers

one was killed, another mortally, and a third, Captain Bigelow, severely wounded. Of seven sergeants, two were killed and four wounded; or a total of twenty-eight men, including two missing; and eighty out of eighty-eight horses were killed and wounded. As the battery had sacrificed itself for the safety of the line, its work is specially noticed as typical of the service that artillery is not infrequently called upon to render, and did render in other instances at Gettysburg besides this one. When Sickles was wounded General Meade directed Hancock to take command of the Third as well as his own corps, which he again turned over to Gibbon. About 7:15 P. M., the field was in a critical condition. Birney's division was now broken up; Humphreys's was slowly falling back, under cover of McGilvery's guns; Anderson's line was advancing. On its right, Barksdale's brigade, except the Twenty-first Mississippi, was held in check only by McGilvery's artillery, to whose support Hancock now brought up Willard's brigade, of the Second Corps. Placing the Thirty-ninth New York in reserve, Willard with his other three regiments charged Barksdale's brigade and drove

it back nearly to the Emmettsburg road, when he was himself repulsed by a heavy artillery and infantry fire, and fell back to his former position near the sources of Plum Run. In this affair Willard was killed and Barksdale mortally wounded. Meanwhile the Twenty-first Mississippi crossed the run from the neighborhood of the Trostle house, and drove out

the men of Watson's battery ("I," Fifth United States), on the extreme left of McGilvery's line, but was in turn driven off by the Thirty-ninth New York led by Lieutenant Peeples of the battery, musket in hand, who thus recovered his guns, Watson being severely wounded.

Birney's division once broken, it was difficult to stem the tide of defeat. Hood's and McLaws's divisions—excepting Barksdale's brigade—compassed the Devil's Den and its woods, and as the Federal reinforcements from other corps came piecemeal, they were beaten in detail until by successive accretions they greatly outnumbered their opponents, who had all the advantages of position, when the latter in turn retired, but were not pursued. This fighting was confined almost wholly to the woods and Wheat-field between the Peach Orchard and Little Round Top, and the great number of brigade and regimental commanders, as well as of inferior officers and soldiers, killed and wounded on both sides, bears testimony to its close and desperate character. General Meade was on the ground active in bringing up and putting in reinforcements, and in doing so had his horse shot under him. At the close of the day the Confederates held the base of the Round Tops, Devil's Den, its woods, and the Emmettsburg road, with skirmishers thrown out as far as the Trostle house; the Federals had the two Round Tops, the Plum Run line, and Cemetery Ridge. During the night the Plum Run line, except the wood on its left front (occupied by McCandless's brigade, Crawford's division, his other brigade being on Big Round Top), was abandoned; the Third Corps was massed to the left and rear of Caldwell's division, which had reoccupied its short ridge, with McGilvery's artillery on its crest. The Fifth Corps remained on and about Round Top, and Ruger's division of the Twelfth returned to Culp's Hill.

When Longstreet's guns were heard, Ewell opened a cannonade, which after an hour's firing was overpowered by the Federal artillery on Cemetery Hill. Johnson's division then advanced, and found only one brigade—Greene's—of the Twelfth Corps in position, the others having been sent to the aid of Sickles at the Peach Orchard. Greene fought with skill and determination for two or three hours, and, reinforced by seven or eight hundred men of the First and Eleventh Corps, succeeded in holding his own intrenchments, the enemy taking possession of the abandoned works of Geary and Ruger. This brought Johnson's troops near the Baltimore pike, but the darkness prevented their seeing or profiting by the advantage then within their reach. When Ruger's division returned from Round Top, and Geary's from Rock Creek,

EARLY'S CHARGE ON THE EVENING OF JULY 2D UPON EAST CEMETERY HILL.

they found Johnson in possession of their intrenchments, and immediately prepared to drive him out at daylight.

It had been ordered that when Johnson engaged Culp's Hill, Early and Rodes should assault Cemetery Hill. Early's attack was made with great spirit, by Hoke's and Avery's brigades, Gordon's being in reserve; the hill was ascended through the wide ravine between Cemetery and Culp's hills, a line of infantry on the slopes was broken, and Wiedrich's Eleventh Corps, and Ricketts's reserve batteries near the brow of the hill overrun; but the excellent position of Stevens's twelve-pounders at the head of the ravine, which enabled him to sweep it, the arrival of Carroll's brigade sent unasked by Hancock,—a happy inspiration, as this line had been weakened to send supports both to Greene and Sickles,—and the failure of Rodes to coöperate with

Early, caused the attack to miscarry. The cannoners of the two batteries so summarily ousted rallied, and recovered their guns by a vigorous attack with pistols by those who had them, by others with handspikes, rammers, stones, and even fence-rails; the "Dutchmen" showing that they were in no way inferior to their "Yankee" comrades, who had been "running" them ever since Chancellorsville. After an hour's desperate fighting the two Confederate brigades were driven out with heavy loss, Avery being among the killed.

At the close of this second day a consultation of corps commanders was held at General Meade's headquarters. I was not present, although summoned, but was informed that the vote was unanimous to hold our lines, and to await an attack for at least one day before taking the offensive, and General Meade so decided.

FARNSWORTH'S CHARGE.

“ROUND TOP” AND THE CONFEDERATE RIGHT AT GETTYSBURG.

MORE has been written concerning the battle of Gettysburg than any other “passage of arms” between the Federal and Confederate troops during the civil war. The engagement of the 1st of July, brought on by accident, on the part of the Confederates at least, in which two corps of the Federal army under General Reynolds were defeated and driven through Gettysburg by portions of Hill’s and Ewell’s corps, has been often and fully described by the officers on both sides. Ewell’s attack on the Federal right in the vicinity of Culp’s Hill on the 2d of July, and Longstreet’s advance upon the Federal left on the same day, so far as relates to one division of the latter’s command (McLaws’s), have been detailed with equal minuteness by those engaged. The magnificent charge of Pickett’s division on the Federal center on the third day has been the theme of a host of writers who deemed it an honor to have stood in the lines of blue by which that charge was repelled, and those who, on the other hand, thought it no less an honor to have shared the fortunes of the torn and shattered columns of gray which only failed to accomplish impossibilities.

But concerning the operations of Lee’s extreme right wing, extending to the foot of “Round Top,” little or nothing has been written on the Confederate side. This part of the line was held by Hood’s division of Longstreet’s corps, and was really the key to the whole position of Gettysburg. Here some of the most stubborn fighting of that desperate battle was done, and here a determined effort of the Federal cavalry to reach the right rear of the Confederate army on the 3d of July was

frustrated — an attempt which, if successful, must have resulted disastrously to that army.

The meagerness of the details of the operations referred to may be accounted for by the fact that General Longstreet personally superintended the left of his line, consisting of McLaws’s division of his own corps, supported by R. H. Anderson’s division of Hill’s corps, and hence knew comparatively little from personal observation of the movements of Hood’s division; and, also, that General Hood was wounded early in the engagement on the 2d of July, and relinquishing the command of the division, could not report its subsequent operations. As senior brigadier, I succeeded to the command of Hood’s division, and directed its movements during the engagements of the 2d and 3d of July. But owing to the active and constant movements of our army for some weeks subsequent to the battle, I was only able to obtain the reports of brigade commanders a very short time previous to being ordered to the army of General Bragg at Chickamauga. This prevented me from making a report at the time, and it was afterwards neglected.

The facts stated in this paper are therefore many of them published for the first time. It remains for the impartial reader to decide whether they do not constitute an important part of the history of the most memorable battle of the war; for Gettysburg was the turning-point in the great struggle. Together with the fall of Vicksburg, which occurred simultaneously with the retreat of Lee’s army towards the Potomac, it inspired the armies and people of the North with fresh courage and stimulated anew the hopes of ultimate success

which were visibly flagging under an almost uninterrupted series of reverses to the Federal arms in Virginia, extending over a period of nearly two years. On the other hand, it was at Gettysburg that the right arm of the South was broken, and it must always stand out in Confederate annals like

“Flodden’s fatal field,
Where shivered was fair Scotland’s spear,
And broken was her shield,”

in the history of a brave and kindred people. When the fight began at Gettysburg on the

Chambersburg and Emmettsburg roads, following McLaws, who was in advance. Pickett’s division had not yet come up. We moved very slowly, with frequent halts and deflections from the direct course — the latter occasioned by the desire to conceal our movements from the Federal signal-station on Little Round Top.

At length, after many vexatious delays, Hood’s division was pushed forward until it uncovered McLaws, and soon reached the Emmettsburg road in front of Round Top. Here our line of battle was formed at an acute

THE “SLAUGHTER PEN” AT THE BASE AND ON THE LEFT SLOPE OF LITTLE ROUND TOP. (FROM PHOTOGRAPHS.)

1st of July, three brigades of Hood’s division were at Greenwood on the Chambersburg road and on the west side of South Mountain. My own brigade, with Bachman’s battery, was at New Guilford, some miles south of Greenwood, watching our right flank. At three o’clock on the morning of the 2d I moved, under orders from General Longstreet, as rapidly as possible towards Gettysburg, and arrived there shortly before 12 M., having marched the intervening distance of twenty-four miles in that time. On my arrival I found the other brigades of Hood’s division resting about a mile from the town, on the Chambersburg road. In a short time after my brigade came up, the division was moved to our right (south), traversing the angle between the

angle with the road, the right being in advance of it, between the road and the mountain, and the left extending across and in rear of the road. The formation was in two lines, Law’s Alabama and Robertson’s Texas brigades in front, supported, at a distance of about two hundred yards, by the Georgia brigades of Benning and G. T. Anderson. McLaws’s division extended the line to our left, with a similar formation. The Artillery Battalion, composed of Reilly’s, Latham’s, Garden’s, and Bachman’s batteries, twenty guns in all, were disposed at advantageous points upon the ridge occupied by the line of infantry. There were no signs of Federal cavalry or troops of any kind on our right. As a precautionary measure, however, a regiment was detached

The monument marks the position of the 91st Pennsylvania of Weed's brigade. The Emmetsburg road passes the Peach Orchard, Rogers's, and Codori's; the latter's buildings broke the center of Pickett's lines as they charged upon the ridge between Cemetery Hill and Little Round Top. — EDITOR.

from Anderson's brigade and stationed at Kern's house, half a mile down the road towards Emmettsburg.

It was now past four o'clock in the afternoon and our troops were in position for the attack. The flank movement by which they came into position is referred to in the following dispatch from the Federal signal-station on Little Round Top: "To General Meade—four

o'clock P. M. The only infantry of the enemy visible is on the extreme (Federal) left; it has been moving towards Emmettsburg." It will thus be seen that the movement, in spite of our precautions, was not unobserved.

The Confederate line of battle occupied a ridge, partially wooded, with a valley intervening between it and the heights held by the Federal troops in front. The position occupied by the Federal left wing in front of us was now fully disclosed to view, and it was certainly one of the most formidable it had ever been the fortune of any troops to confront. Round Top rose like a huge sentinel guarding the Federal left flank, while the spurs and ridges trending off to the north of it afforded unrivaled positions for the use of artillery. The puffs of smoke rising at intervals along the line of hills, as the Federal batteries fired upon such portions of our line as became exposed to view, clearly showed that these advantages had not been neglected. The thick woods which in great part covered the sides of Round Top and the adjacent hills concealed from view the rugged nature of the ground, which increased fourfold the difficulties of the attack.

How far up the slope of Round Top the Federal left extended we could not tell, as the woods effectually concealed from view everything in that quarter. In order to gain information upon this important point, I sent out a detail of six picked men as scouts, with instructions to move as rapidly as possible to the summit of Round Top, making a *détour* to their right, and "feeling" down from that point, to locate the left of the Federal line. The entire absence of Federal cavalry on our right, as well as other

THE STRUGGLE FOR DEVIL'S DEN. (BY A. R. WAUD, FROM HIS SKETCH MADE AT THE TIME.)

indications leading to the same conclusion, convinced me that the Federals, relying upon the protection of the mountain, considered their flank secure; that it was therefore their most vulnerable point. Impressed with this view, I further instructed the scouts when they reached the summit to observe carefully the state of affairs on the other side, and to send a "runner" back to me with such intelligence as they might be able to gain. They moved off at a trot. A few moments after they had

DEVIL'S DEN, FACING LITTLE ROUND TOP.

started I saw in the valley, some distance to our right, several dark figures moving across the fields from the rear of Round Top in the direction of the Emmetsburg road. These on being captured, proved to be Federal soldiers, whose seemed surprised at our sudden appearance in that quarter, and who, on being questioned, stated that they had surgeon's certificates and were "going to the rear." They indicated "the rear" by pointing towards Emmetsburg, and in reply to the question where they came from, they said from the "medical train behind the mountain"—referring to Round Top. They also stated that the medical and ordnance trains "around the mountain" were insecurely guarded, no attack being expected at that point; and that the other side of the mountain could be easily reached by a good farm road, along which they had just traveled, the distance being little more than a mile. On my way to convey this information to General Hood, I met a messenger from my scouts, who had reached the crest of Round Top. He reported that there was no Federal force on the summit, and confirmed in every particular the statements of the prisoners I had just captured. If there had previously been any question in regard to the policy of a front attack, there now remained not a "shadow of doubt" that our true *point d'appui* was Round Top, from which the Confederate right wing could be extended to-

wards the Taneytown and Baltimore roads, on the Federal left and rear.

I found General Hood on the ridge where his line had been formed, communicated to him the information I had obtained, and pointed out the ease with which a movement by the right flank might be made. He coincided fully in my views, but said that his orders were positive to attack in front, as soon as the left of the corps should get into position. I therefore entered a formal protest against a direct attack, on the grounds: 1. That the great natural strength of the enemy's position in our front rendered the result of a direct assault extremely uncertain. 2. That, even if successful, the victory would be purchased at too great a sacrifice of life, and our troops would be in no condition to improve it. 3. That a front attack was unnecessary,—the

BETWEEN THE BOWLDERS OF DEVIL'S DEN—A DEAD CONFEDERATE SHARPSHOOTER.
(FROM A PHOTOGRAPH.)

occupation of Round Top during the night by moving upon it from the south, and the extension of our right wing from that point across the enemy's left and rear, being not only practicable, but easy. 4. That such a movement would compel a change of front on the part of the enemy, the abandonment of his strong position on the heights, and force him to attack us in position.

General Hood called up Captain Hamilton, of his staff, and requested me to repeat the protest to him, and the grounds on which it was made. He then directed Captain Hamilton to find General Longstreet as quickly as possible and deliver the protest, and to say to him that he (Hood) indorsed it fully. Hamilton rode off at once, but in about ten minutes returned, accompanied by a staff-officer of General Longstreet, who said to General Hood, in my hearing, "General Longstreet orders that you begin the attack at once." Hood turned to me and merely said, "You hear the order?" I at once moved my brigade to the assault. I do not know whether the protest ever reached General Lee. From the brief interval that elapsed between the time it was sent to General Longstreet and the receipt of the order to begin the attack, I am inclined to think it did not. General Longstreet has since said that he repeatedly advised against a front attack and suggested a movement by our right flank. He may have thought, after the rejection of this advice by General Lee, that it was useless to press the matter further.

Just here the battle of Gettysburg was lost to the Confederate arms. It is useless to speculate upon the turn affairs might have taken if the Confederate cavalry had been in communication with the rest of the army, and if General Stuart had kept General Lee informed, as he should have done, of the movements of the Federal army. In considering the causes of the Confederate failure on that particular field, we must take the situation just as we find it. And the situation was as follows: The advance of the two armies encountered each other on the 1st of July. An engagement ensued in which the Confederates were victorious. The Federal troops retired through Gettysburg and took position along the heights east of the town—a position which, if properly defended, was practically impregnable to a direct attack.

The whole matter then resolves itself into this: General Lee failed at Gettysburg on the 2d and 3d of July because he made his attack precisely where his enemy wanted him to make it and was most fully prepared to receive it. Even had he succeeded in driving the Federal army from its strong position by a general and simultaneous assault along the whole front (which was the only possible

chance of success in that direction), he would have found his army in very much the same condition that Pyrrhus found his when, after driving the Romans from the field of Asculum, he exclaimed, "Another such victory, and I am undone!"

The failure of General Ewell to seize "Cemetery Hill" and adjacent positions, on the evening of July 1st, has been frequently assigned as one of the causes of our losing the battle. It is very doubtful whether General Ewell could have occupied those heights had he made the attempt, for General Pleasanton has asserted very positively that, on the night of the 1st of July, "we (the Federals) had more troops in position than Lee." And General Lee qualified his instructions to General Ewell to seize the heights by the words "if practicable." Under the circumstances, the fact that General Ewell did not seize them is very strong presumptive evidence that it was not practicable.

The two armies being face to face on the 2d of July, and setting aside all question of a retreat by either, General Lee's alternative to a direct attack was a movement by his right flank to the Federal left and rear. The first promised nothing but desperate fighting, heavy loss, and probable failure. The second certainly promised nothing worse, with the probabilities all in favor of a "fair field and a free fight," and that was all his army asked. Referring to this suggested movement upon the Federal left flank, General Pleasanton, who commanded the Federal cavalry at that time, has expressed the opinion that it was impracticable, and has stated further that he "had two divisions of cavalry, one in rear of the Federal position and one on Lee's right flank," to prevent it. If the cavalry had been there, as he states, they would not have amounted to even a single "ounce of prevention," as far as the movements of our infantry were concerned. But if there *was* a division, or even a single picket-post of cavalry, either Federal or Confederate, on our right flank, at any time on the 2d of July, it was kept most persistently out of sight, as my scouts, who were sent out in all directions, failed to find it.

The order of attack, which was issued as soon as the two divisions of Longstreet's corps came into position on the line already described, was to begin the movement on the right, my brigade on that flank leading, the other commands taking it up successively towards the left. It was near five o'clock P. M. when we advanced to the attack. The artillery on both sides had been warmly engaged for about fifteen minutes, and continued to fire heavily until we became engaged with the Federal infantry, when the Confederate bat-

teries ceased firing to avoid injury to our own troops, who were then, for the most part, concealed by the woods about the base of Round Top and the spurs to the north of it. General Hood was severely wounded in the arm by the fire from the Federal artillery as we moved into action.

Advancing rapidly across the valley which separated the opposing lines,—all the time under a heavy fire from the batteries,—our front line struck the enemy's skirmishers posted along the further edge of the valley. Brushing these quickly away, we soon came upon their first line of battle, running along the lower slopes of the hills known as Devil's Den, to our left of Round Top, and separated from the latter by Plum Run valley. The fighting soon became close and severe. Exposed to the artillery fire from the heights in front and on our left, as well as to the musketry of the infantry, it required all the courage and steadiness of the veterans who composed the Army of Northern Virginia—whose spirit was never higher than then—to face the storm. Not one moment was lost. With rapidly thinning ranks the gray line swept on, until the blue line in front wavered, broke, and seemed to dissolve in the woods and rocks on the mountain side. The advance continued steadily, the center of the division moving directly upon the guns on the hill adjoining Devil's Den, on the north from which we had been suffering so severely. In order to secure my right flank, I extended it well up on the side of Round Top, and my brigade, in closing to the right, left a considerable interval between its left and the right of the Texas brigade of Robertson. Into this interval I threw Benning's Georgia brigade, which had up to that time occupied the second line. At the same time seeing a heavy Federal force on Robertson's left, and no Confederate troops having come up to extend our line in that direction, Anderson's Georgia brigade, till then also in the second line, was thrown out on that flank.

Thus disposed, the division continued to move forward, encountering, as it ascended to the battery on the spur and the heights to the right and left of it, a most determined resistance from the Federal troops, who seemed to be continually reënforced. The ground was rough and difficult, broken by rocks and boulders, which rendered an orderly advance impossible. Sometimes the Federals would hold one side of the huge boulders on the slope until the Confederates occupied the other. In some cases my men, with reckless daring, mounted to the top of the large rocks in order to get a better view and to deliver their fire with greater effect. One of these, Sergeant Barbee of the Texas brigade, having

reached a rock a little in advance of the line, stood erect on the top of it, loading and firing as coolly as if unconscious of danger, while the air around him was fairly swarming with bullets. He soon fell helpless from several wounds; but he held his rock, lying upon the top of it until the litter-bearers carried him off.

In less than an hour from the time we advanced to the attack, the hill by Devil's Den opposite our center was taken, with three pieces of the artillery that had occupied it. The remaining piece was run down the opposite slope by the gunners, and escaped capture.

In the mean time my brigade on the right, had swept over the northern slope of Round Top, cleared it of the enemy, and then, making a partial change of front to the left, advanced upon Little Round Top, which lay in rear of the spur on which the battery had been taken. This change of direction soon exposed it to a flank attack on the right by fresh Federal troops (Vincent's brigade), rendering it necessary to retire this flank and place it in the general direction of the rest of the line.

While our center and right wing were engaged as I have described, Anderson's brigade, on the left, was subjected to great annoyance and loss by movements of the enemy upon its left flank, being frequently compelled to change the front of the regiments on that flank to repel attacks from that direction.

Up to this time I had seen nothing of McLaws's division, which was to have extended our left and to have moved to the attack at the same time. I therefore halted my line, which had become broken and disorganized by the roughness of the ground over which it had been fighting, and placing it in as advantageous a position as possible for receiving any attack that the Federals might be disposed to make, I hurried back to the ridge from which we had originally advanced. I found McLaws still in position there, his troops suffering considerably from a severe fire of artillery from the opposite hills. I was informed by General Kershaw, who held the right of this division, that although he understood the general instructions that the forward movement was to be taken up from the right, he had not yet received the order to move, from his division commander. I pointed out the position of Hood's division, and urged the necessity of immediate support on its left. General Kershaw requested me to designate the point on which his right flank should be directed, and promptly moved to the attack, the movement being taken up by the whole division.

When Hood's division first attacked, General Meade, alarmed for the safety of his left wing, and doubtless fully alive to the importance of holding so vital a point as Round

Top and its adjacent spurs, commenced sending reinforcements to the threatened points. We encountered some of these in our first advance, and others were arriving as McLaws came up on our left. In its advance this division extended from the "Peach Orchard" near the Emmettsburg road, on its left, to the "Wheat-field" north of the hill on which we had captured the Federal battery, where its right wing connected with my left. As McLaws advanced, we again moved forward on his right, and the fighting continued in "see-saw" style — first one side and then the other gaining ground or losing it, with small advantage to either, until dark.

At the close of the engagement Hood's division held the hill where the battery had been taken and the ridge to its left — our right extending across Devil's Den and well up on the north-western slope of Round Top. During the night this line was strengthened by the construction of a breastwork of the loose stones that abounded all along the positions occupied by the troops, and the light of the next morning disclosed the fact that the Federal troops in front of us had improved their time in the same way. In fact, all through the night we could hear them at work as the rocks were dropped in place on the works, and no doubt they heard us just as distinctly while we were engaged in the same life-preserving operation.

Though the losses had been severe on both sides, comparatively few prisoners had been taken. But early in the night, in the confusion resulting from the fight over such rugged ground and the darkness of the wooded mountain side, men of both armies, in search of their commands, occasionally wandered into the opposing picket-lines and were captured. Many of the Federal wounded were left in our lines on the ground from which their troops had been forced back, and some of ours remained in their hands in the most advanced positions we had reached and had been compelled to abandon. Among these latter was Colonel Powell of the Fourth Texas regiment, who was shot through the body and afterwards died. Powell was a stout, portly man, with a full beard, in many respects resembling General Longstreet, which at first created the impression with his captors that they had taken that officer. Indeed it was asserted positively by some of the prisoners we picked up during the night that General Longstreet was badly wounded and a prisoner in their hands, and they obstinately refused to credit our statements to the contrary.

Early in the morning of the 3d two of my batteries, Latham's and Garden's, were sent to Colonel, afterward General, E. P. Alexander, who commanded our artillery in the center, to

assist in the cannonade of the Federal position south of Cemetery Hill, preparatory to the assault of Pickett's division at that point; and about nine o'clock A. M. General Longstreet came over to my position on the right, and instructed me to be ready to renew the attack on our front. Under the circumstances that then existed, such an attack would have been simply unadulterated madness. I have already described the difficult nature of the ground in our front. These difficulties were greatly increased by extemporized breastworks of rock all along the Federal line, which afforded good protection for their infantry and were fully manned by a force much superior to our own. On the other hand, we had been weakened in the desperate attack of the preceding evening by losses amounting to one-fourth of the whole force carried into action. More than two thousand officers and men of our division had been killed and wounded, among them Generals Anderson and Robertson, and about one-half of the field-officers of the various regiments. McLaws's division, on our left, had suffered nearly as severely, General Barksdale of that division being killed and General Semmes mortally wounded.

The cannonade in the center soon began, and presented one of the most magnificent battle-scenes witnessed during the war. Looking up the valley towards Gettysburg, the hills on either side were capped with crowns of flame and smoke, as three hundred guns, about equally divided between the two ridges, vomited their iron hail upon each other. Dense clouds of smoke settled over the valley, through which the shells went hissing and screaming on their errand of death. Numbers of these from opposite directions exploded midway over the valley, apparently with venomous impatience, as they met each other in mid-air, lighting up the clouds with snake-like flashes of lurid lightning.

While this grand artillery duel was progressing, and before our infantry had moved to the attack, a new danger threatened us on the right. This was the appearance of Kilpatrick's division of cavalry, which moved up on that flank and commenced massing in the body of timber which extended from the base of Round Top westward towards Kern's house, on the Emmettsburg road. Reilly's and Bachman's batteries were ordered to change front to the right so as to bear upon this position, and at once opened fire upon the cavalry, which retired beyond the wood and out of sight. In order to protect my flank more fully, I withdrew the First Texas regiment of Robertson's brigade from the main line, and placed it in position midway between Round Top and the Emmettsburg road, with

skirmishers extending from its left and connecting at right angles with the extreme right of the main line on the slope of the mountain. I also detached the Seventh and Eighth Georgia regiments of Anderson's brigade, and sent them to the support of the Ninth, which had been stationed at Kern's house. About the time these dispositions were completed, Colonel Black, of the First South Carolina Cavalry, reported to me with about one hundred men who had been gathered up from the medical trains, most of them partly disabled and only a part mounted, and with three guns of Hart's battery of horse artillery. Hart's guns were stationed on the Emmetsburg road, and the cavalry extended the right flank beyond that road. This new flanking line was formed at right angles to the main line, and crossed the Emmetsburg road near Kern's house.

One brigade of the Federal cavalry (Merritt's) moved across the road and deployed a strong line of dismounted skirmishers in front of Colonel Black's command, which was too weak to offer any effectual resistance. Hart's guns, however, were well handled, and did good service as long as the enemy remained in reach of them. To meet this flanking movement, I had to extend the Seventh and Eighth Georgia regiments to the right, and heavy skirmishing continued as the lines developed, with occasional efforts of the Federals to break through, until about half-past three o'clock P. M., when my two regiments were stretched out to a bare line of skirmishers.

It is not an easy task to operate against cavalry with infantry alone, on an extended line and in an open country where the former, capable of moving much more rapidly, can choose its own points of attack and can elude the blows of its necessarily more tardy adversary. But Merritt's brigade was now dismounted and deployed as skirmishers, and I lost no time in taking advantage of this temporary equality as to the means of locomotion. Detaching the two remaining regiments of Anderson's brigade (Eleventh and Fifty-ninth Georgia) from the main line, I moved them rapidly to our extreme right, now about a mile from Kern's house, attacked Merritt's reserve, and then, changing front to the left, struck his skirmish-line "on its end" and "doubled it up" as far as the Emmetsburg road. This reduced my front to manageable dimensions and left some force at my disposal to meet any concentrated attack that the cavalry might make.

I had just returned to the position occupied by our artillery, which was in the angle formed by the main and flanking lines, when Farnsworth's cavalry brigade charged the line held by the First Texas regiment. It was impossible to use our artillery to any advantage owing

to the "close quarters" of the attacking cavalry with our own men—the leading squadrons forcing their horses up to the very muzzles of the rifles of our infantry. That portion of the cavalry which covered the front of the First Texas regiment was handsomely repulsed; but the First Vermont regiment, forming the Federal right wing, overlapped the First Texas on its left, and, striking the skirmish-line only, rode through it into the open valley in rear of our main line on the spurs of Round Top. When I first became satisfied, through information from the Texas skirmishers, that Farnsworth's brigade was massing in their front, the Ninth Georgia regiment was ordered from Kern's house to the support of the batteries, the former position being now safe, as the other four regiments of Anderson's brigade were concentrated near that point. Hearing the firing and knowing its cause, the Ninth Georgia came up at a run, just as the First Vermont Cavalry rode through our skirmish-line, led by General Farnsworth in person. Instead of moving directly upon our batteries, the cavalry directed its course up the valley towards Gettysburg, passing between the position of our artillery and our main line. Watching the direction they had taken, I sent Lieutenant Wade, of my staff, rapidly across the valley in advance of them, with orders to detach the first regiment he should come to, on the main line, and send it down on a run to "head them off" in that direction. He was also ordered to follow the line to the extreme right and direct Colonel Oates (Fifteenth Alabama) to strengthen his flanking skirmish-line and to close up the gap on the left of the First Texas where the cavalry had broken in.

Farnsworth and his cavalry, in the mean time, were riding in gallant style, with drawn sabers and unopposed, up the valley. As they approached Snyder's house, and as I stood intently watching them, I saw a ragged Confederate battle-flag fluttering among the trees at the foot of the opposite ridge, and the men with it soon after appeared, running out into the open ground on the further side of the valley. It was the Fourth Alabama regiment, Law's brigade, which had been taken from the main line and sent down by Lieutenant Wade. The men opened fire as they ran. The course of the cavalry was abruptly checked and saddles were rapidly emptied. Recoiling from this fire, they turned to their left and rear, and directed their course up the hill towards the position occupied by our batteries. Bachman's battery promptly changed front to its left, so as to face the approaching cavalry, and, together with its infantry supports, opened a withering fire at close range. Turning again to their left, Farnsworth and

the few of his men who remained in their saddles directed their course towards the point where they had originally broken in, having described by this time almost a complete circle. But the gap where they had entered was now closed, and receiving another fire from that point, they again turned to the left and took refuge in the woods near the base of Round Top. When the last turn to the left was made, about half a dozen of their number separated from the main body and escaped by "running the gauntlet" to the right of the First Texas regiment.

While these movements were in progress I could plainly distinguish General Farnsworth, who led the charge, and whom I then supposed to be Kilpatrick. He wore a linen havelock over his military cap, and was evidently wounded at the time he entered the woods. Here, with his little handful of gallant followers, he rode upon the skirmish-line of the Fifteenth Alabama regiment, and, pistol in hand, called upon Lieutenant Adrian, who commanded the line, to surrender. The skirmishers in return fired upon him, killing his horse and wounding General Farnsworth in several places. As he fell to the ground, Adrian approached him and demanded his surrender. He curtly refused to surrender, at the same time killing himself with the pistol which he still held in his hand. During the afternoon the pickets of the First Texas regiment had been so near the point where the Federal cavalry were preparing for the attack as to hear their voices distinctly when raised at all above the ordinary tone. Just before the charge was made they heard some one say, in an excited, angry tone, "Colonel, if you are afraid to attack, by —, I will lead the charge myself." I afterwards learned that the speaker was General Kilpatrick, and that the words were addressed to General Farnsworth, who was aware of the difficulties of the movement and would not have made it if the matter had been left to his own judgment. However this may have been, he certainly bore himself with the most conspicuous gallantry throughout that fatal charge.*

General Longstreet, aware of the danger that threatened our right from the attack of Kilpatrick's division, came over to my position late in the afternoon and expressed his satisfaction at the result and the promptness and good conduct of the troops engaged. We had all day held our front line, gained the

evening before, ready and able to repel any attack from the superior force in our front, and with troops drawn from that line had given to General Kilpatrick his congé on our right flank. It seemed to us on the Confederate right that there was at least one little spot of "silver lining" in the cloud that hung so darkly over the field of Gettysburg after the disastrous charge of Pickett.

Late in the afternoon of July 3d, I was ordered to withdraw the division from the lines it had held since the evening of the 2d to the ridge near the Emmetsburg road, from which it had advanced to the attack on that day. McLaws's division, which had held the line to our left during the day, retired first, and I ordered my brigade commanders to take up the movement from left to right. The courier who delivered the order to General Benning holding the left of the division, in designating the position to which he was to retire, pointed to the line McLaws had just abandoned. Benning, supposing that McLaws had been moved for the purpose of reënforcing our line on some other part of the field, dispatched Colonel DuBose with the Fifteenth Georgia Regiment in that direction. McCandless's Federal brigade had, in the mean time, advanced to the ground previously held by McLaws, and attacked the Fifteenth Georgia when it attempted to take up that position. Colonel DuBose made a gallant but fruitless attempt to hold his ground, expecting support from the other regiments of his brigade. Being attacked in front and on both flanks by McCandless's brigade, reënforced by Bartlett's, he was driven back with considerable loss. He retired from one position to another, fighting as he retreated, and finally succeeded in extricating his regiment and rejoining his brigade. The loss of the Fifteenth Georgia in this affair was very heavy, including one hundred and one prisoners, beside the killed and wounded. In the mean time General Benning, having received a second order to retire, withdrew the remainder of his brigade without loss. The other brigades of the division were quietly withdrawn, the Federals in their front making no advance. We remained quietly in our new position across the Emmetsburg road until near daylight on the morning of the 5th, when we took up the line of march with the rest of the army towards Fairfield Gap and the Potomac.

E. M. Law.

* Major Clifford Thomson, of General Pleasonton's staff, writes that when General Kilpatrick ordered General Farnsworth to charge, the latter, referring to the two or three stone fences between his command and the enemy, replied that in view of the obstacles it would be simply a slaughter of men. Kilpatrick answered, in effect, that if Farnsworth was afraid to make the charge he would lead it himself, and Farnsworth replied: "General Kilpatrick, you can't lead men anywhere that I cannot go. If you give

me the order to charge I will do so, but you take the responsibility." Just before the battle Custer, Merritt, and Farnsworth were recommended to be brigadier generals and were given such commands. Farnsworth's commission was dated June 29th, five days before his death. As he had been on detached service, it had not reached him, being carried among Pleasonton's headquarters' papers until after the battle. His previous rank had been captain in the Eighth Illinois Cavalry.—EDITOR.

MEMORANDA ON THE CIVIL WAR.

The Capitulation of Harper's Ferry.

ARMY WATER-CART.

RECENT contributions from distinguished officers of the Confederate army, relative to the battle of Antietam and the capitulation of Harper's Ferry, although substantially correct so far as they go, are necessarily incomplete, and do not present the situation and circumstances under which the last-named event took place from

the stand-point of the other side.

On the 8th of September, 1862,—being then in command of the Union forces at Martinsburg, Virginia, about two thousand five hundred of all arms,—I reported to General Wool at Baltimore, commanding the Department, that the enemy was approaching from the north in a force estimated at 15,000 to 20,000, and asked for instructions. General Wool replied :

"If 20,000 men should attack you, you will of course fall back. Harper's Ferry would be the best position I could recommend." * * *

After reconnoissance, and some skirmishing with the enemy's advance, demonstrating that his force was too large to successfully oppose, especially as there were no defenses at Martinsburg, the post was, in accordance with General Wool's views, evacuated, and Harper's Ferry reached on the 12th.

Upon reporting to Colonel Miles, the officer in command, he showed me the following dispatch :

"WASHINGTON, D.C., Sept. 7, 1862. COLONEL MILES, Harper's Ferry : Our army [McClellan's] is in motion ; it is important that Harper's Ferry be held to the latest moment. The Government has the utmost confidence in you, and is ready to give you full credit for the defense it expects you to make. H. W. HALLECK, General-in-Chief."

In view of the foregoing dispatch, and of the fact that I had been ordered from Harper's Ferry to the command at Martinsburg a few days previously by General Wool, it was manifest that the authorities intended to retain Miles in command—very properly so, as he was an officer of forty years' experience.

The defenses of Harper's Ferry, if worthy of the name, consisted of a small work on the crest of Maryland Heights called Stone Fort ; another well down the western slope, where a battery of heavy naval guns was established. There was also down the western slope from the Stone Fort a line of intrenchments terminating at a work near the Potomac called Fort

Duncan, but this line was not occupied except at the upper end.

On Bolivar Heights a line of rifle-pits extended from near the Potomac southward to the Charlestown road, where a small work for the protection of artillery was situated.

In the rear of this line eastward, and in the upper part of the town, was an earthwork known as Camp Hill. Loudoun Heights (east of the Shenandoah) were not occupied by our troops.

The troops constituting the garrison were disposed by Colonel Miles as follows : on Maryland Heights, about two thousand ; on Bolivar Heights, from the Potomac to the Charlestown road, thence at a right angle to the Shenandoah, a distance in all of at least a mile and a half, seven thousand men ; in the work at Camp Hill, about eight hundred ; and the remainder, about one thousand, guarded the bridges and other points on the rivers.

The distance from Maryland Heights to the nearest point on Bolivar Heights, by way of the pontoon bridge, was two and a quarter miles ; to the intersection of the Charlestown road, three miles. Thus the principal points to be defended were not within supporting distance of each other in case of assault, nor was either of them properly fortified.

On the 13th the divisions of Generals McLaws and R. H. Anderson, by order of General Lee, reached Maryland Heights, and attacked the force stationed there, under Colonel Ford, who after some fighting abandoned the position—as he stated, by order of Colonel Miles, but the latter denied having given such an order. Be this as it may, it is certain that the enemy could have easily taken it with the force at his command, whenever he chose to do so.

It has generally been considered that Colonel Miles should have tried to hold that position, even if it became necessary to mass his whole force there. The reasons given by him to the writer for not doing so were : (1) That his orders required him to hold Harper's Ferry, and this would be a violation of such orders ; (2) that water would be inaccessible. Moreover, it was manifest that if Harper's Ferry were evacuated, the enemy would close in from beyond Bolivar Heights, and from Loudoun Heights, and cross to the north side of the Potomac, thus wholly enveloping our small force with Lee's entire army, and virtually concentrating the latter in front of McClellan, with the river-crossing at Harper's Ferry, the principal object of its occupation, given up to the enemy.

Whether this view was correct or not, it is a fact that the maintenance of the line on Bolivar Heights till the morning of September 15th prevented the presence of the divisions of Generals A. P. Hill, McLaws, and Anderson with Lee, until the 17th, the day of Antietam, being four full days after General McClellan had received a copy of General Lee's orders directing the movement against Harper's Ferry, and

MAP OF THE DEFENSES AND APPROACHES OF HARPER'S FERRY.

disclosing the fact that fully one-third of his army was south of the Potomac, and much more than that, including the force under McLaws and Anderson, engaged in the movement against Harper's Ferry.

Officers of the Confederate army, before alluded to, writing for the June *CENTURY* (1886), have described the situation of that part of Lee's army north of the Potomac during the 14th, 15th, and 16th as one of "imminent peril," "very serious," etc., etc., virtually admitting that it might have then been defeated. Thus it will be seen that there were two sides to the question whether Maryland Heights was the "Key to Harper's Ferry" under the then existing circumstances, and that the detention of the Confederate forces around that place was prolonged, instead of abbreviated, by the continued occupation of Bolivar Heights, instead of the abandonment of the position for that on Maryland Heights.

During the afternoon of the 14th General Jackson, who had completed the investment of the place by his arrival on the 13th, moved forward with a view to occupy the ridge which is a prolongation of Bolivar Heights south of the Charlestown road and descends toward the Shenandoah River. To oppose this movement troops were advanced, but after a spirited engagement it was manifest that we could not prevent his establishment in the position sought, and at night our force was withdrawn within the lines of defense.

During the evening a consultation took place at which it was determined to send out all the cavalry,

as it was of very little use in the defense of the place, and in case of the capture or surrender of the post, the horses and equipments would be valuable to the enemy. Colonel Arno Voss, Twelfth Illinois Cavalry, ranking cavalry officer, commanded the force which thus escaped. The question whether the infantry could not also escape was discussed and given up, because it was deemed impossible to march it fast enough. Moreover, Colonel Miles considered that he had no right to evacuate Harper's Ferry. The testimony of the cavalry officers, given subsequently, was, with one exception, to the effect that the road was impracticable for artillery, difficult for infantry, and that they could not have escaped.

Soon after daylight on the morning of the 15th fire was opened by the enemy's artillery, comprising probably nearly or quite fifty pieces; those established at the southern extremity of Bolivar Heights completely enfilading that part of our line extending from the Charlestown road northward to the Potomac; those placed on the south-western slope of Loudoun Heights, and on the west side of the Shen-

andoah near by, delivering their fire at an acute angle to our line, being half enfilade; those at or near the crest of Loudoun Heights taking us in rear; and still others in the valley beyond Bolivar Heights firing directly at our front.

The fire was chiefly converged upon the batteries we had established at and near the intersection of Bolivar Heights and the Charlestown road, that being the point upon which it was manifest General Jackson would deliver the expected assault.

The writer, being in command of the forces in this quarter, ordered the massing of the artillery there and the movement of the regiment holding Camp Hill to the front. These orders, as I afterward learned, were countermanded by Colonel Miles, who deemed it necessary to retain a force near the river-crossing; at all events, the order was not executed.

The artillery fight continued until half-past eight in the morning, when it was apparent the assault might be expected immediately. At this time Colonel Miles visited the work at the Charlestown road and said to the writer that the situation seemed hopeless, and that the place might as well be surrendered without farther sacrifice of life. It was replied that such a step should only be taken upon the judgment of a council of war, whereupon Colonel Miles called the commanders of brigades together, who, after consultation, and with great reluctance on the part of some, voted unanimously for capitulation if honorable terms could be obtained, for the following reasons:

First. The officer commanding had lost all confidence in his ability further to defend the place, and was the first to advise surrender.

Second. There was no reason to hope that the attenuated line on Bolivar Heights could be maintained, even for half an hour, against the greatly superior force massed for the assault, supported if necessary by an attack on our rear by Generals Walker and McLaws.

Third. Great as was the disparity in numbers, the disparity in position was greater. Harper's Ferry and Bolivar Heights were dominated by Maryland and Loudoun Heights, and the other positions held by the enemy's artillery. The crest of Maryland Heights is at an elevation of one thousand and sixty feet; the southern point, nearest Harper's Ferry, six hundred and forty-nine feet; Loudoun Heights, nine hundred and fifty-four feet. The south-western slope of the latter and the grounds near by, west of the Shenandoah, where batteries of the enemy were placed, were three hundred to six hundred feet high. The elevation of Bolivar Heights is about three hundred feet, while Camp Hill and the town of Harper's Ferry are still lower. Thus all our movements of men or guns during the engagements of the 14th and 15th, as well as the effect of their own plunging fire, were plainly visible from the enemy's signal-station on Loudoun Heights. No effective reply could be made to the fire from these elevated positions, no suitable defenses existed from which to resist the assault, and there was no opportunity on the morning of the 15th to change our position, if there had been a better one to occupy.

Fourth. Awaiting the assault, then impending, with no hope of even a temporary successful resistance, did not seem to justify the sacrifice of life consequent upon such a course—the situation being regarded as one of the unfortunate chances of war, unavoidable under existing circumstances.

The writer was appointed by Colonel Miles commissioner to arrange the terms of capitulation, and at the urgent request of other officers I accepted the unwelcome duty, in the hope of obtaining honorable conditions. Immediately after the council broke up, Colonel Miles was mortally wounded; he died the next day.

As commissioner I was received very courteously by the Confederate officers, and the terms of capitulation agreed upon with General A. P. Hill provided that all private property of individuals and the side-arms of officers should be retained by them. Refugees, of whom there were a considerable number, were not to be treated as prisoners, except such, if any, as were deserters from the Confederate army. There were none of this class. All the Union troops were immediately paroled, and were not to serve again until regularly exchanged. A number of the prominent officers of the Confederate army spoke of our situation as hopeless from the hour when the investment was completed.

This paper has been prepared for the sole purpose of presenting the salient facts in the case, with no purpose of condemning or vindicating any one connected with it, directly or indirectly, and all incidents not actually necessary to show the causes of the event have been omitted by reason of the limited space which a magazine article allows.

But it is believed that the following facts are estab-

lished by the history of this campaign, and should be presented.

Harper's Ferry is not defensible by a force inferior to that attacking it, unless the surrounding heights be well fortified, and each of them held by a force sufficient to maintain itself unsupported by the others. It was this which doubtless prompted the advice given by General McClellan to General Halleck before the investment, that the garrison be withdrawn.

Had the hard-fought battle of the 17th at Antietam been delivered by General McClellan on the 14th at South Mountain, with as large a force, and with the same energy, and followed by a prompt advance down Pleasant Valley, there seems good reason to believe that Harper's Ferry would have been relieved, the river-crossing secured, the reunion of Lee's army, separated as it was by the Potomac, rendered difficult, if not impossible, and the capture or dispersion of a large part of it probable. But there may have been reasons governing General McClellan which to him seemed to demand the adoption of the course he took in moving against the enemy's left at Antietam. This, however, delayed the battle till the 17th, in face of the fact that Colonel Miles had informed him through Major Russell of the First Maryland Cavalry, who left Harper's Ferry on the 13th, that he could not hold that place more than forty-eight hours—viz., till the 15th. Thus the opportunities of the 14th, 15th, and 16th were lost.

Of course after General McClellan decided to postpone the battle, it would have been of immense advantage if Harper's Ferry had been held a day or two longer; but of those who have claimed that it could have been longer held, no one has yet, so far as the writer is informed, stated *how* a garrison mostly of recruits, under fire for the first time, could have successfully defended an area of three square miles, assailed from all sides by veterans three times their number, posted, with artillery, in positions commanding the whole field. The writer with due deference expresses the opinion that the force under Jackson could have carried the place by assault, within an hour after his arrival before it, or at any time thereafter prior to the surrender, in spite of any resistance which under the circumstances could have been made.

Julius White.

The report of the Military Commission censured Colonels Miles and Ford and Major Baird. It affirmed that there was nothing in the conduct of Colonels D'Utassy and Trimble to call for censure; and that General Julius White merited the approbation of the Commission, adding, "He appears from the evidence to have acted with decided capability and courage."—EDITOR.

Ripley's Brigade at South Mountain.

I FIND that some persons construe the article of General D. H. Hill, in the June CENTURY, as reflecting upon the troops composing the brigade of General R. S. Ripley, at the battle of Boonsboro' or South Mountain. General Hill disclaims any such intention on his part, and the facts are these:

He correctly states Ripley's manoeuvres at Boonsboro' until we reached a position at the foot of the mountain,—on the west side,—when General Ripley said to me (colonel of the Third North Carolina Infantry) that we were entirely cut off from the rest of the army, except G. B. Anderson's brigade, which was on our right, and that he assumed the command

of the two brigades, directing me to take command of the three regiments (Colonel Doles, with his Fourth Georgia, having been detached and sent to a position on the north of the Pike) and that he would remain near me; directing me, at the same time, to advance slowly up the mountain with a strong line of skirmishers in front. Upon reaching the summit, after toiling through the dense undergrowth of laurel, Captain Thruston, in command of the skirmish line, reported troops in his front, a few minutes later confirming his first impression that they were G. B. Anderson's brigade, presenting their left flank and advancing towards his left.

This was promptly reported, through my adjutant, to General Ripley, who directed me to withdraw to my original position; which having been accomplished, I was directed to hold my then position until further orders. After nightfall I moved forward, changing front to left, a short distance, to the support of General Drayton, remaining there without "drawing trigger" until we took up the line of march for Sharpsburg, about ten to twelve at night. While, therefore, we accomplished nothing tangible, we were in position to do any duty for which we might be called.

At Sharpsburg the command made a record of which any troops might well feel proud. General Ripley, for the first time, went to the front with his command, and was wounded before the action became general. This placed Colonel Doles in command as senior colonel. In speaking of the troops here, I can do so only for the Fourth Georgia and Third North Carolina, and no soldiers ever did duty more faithfully or more cheerfully than did they.

I carried into action, the morning of the 17th of September, 520 men, and the loss on that and the following day was 330 men, and 23 out of 27 officers, of which latter 7 were killed or died from their wounds within a few days. Most of the loss was sustained in less than two hours of fighting on the first day. We were in position near the "East Wood," having gone into action through the yard of the Mumma house (which was set fire to by my orders), and for an hour were fighting three lines of Federals, when a division, in column of battalion, came up, and, halting within one hundred yards of my right company, the right of the brigade, opened fire, enfilading my command and causing the heavy loss sustained in so short a time. This necessitated a prompt change of front on my part, and while this was being done I was disabled and carried off the field, not, however, before I had the satisfaction of seeing my brave men held well in hand by my senior captain, S. D. Thruston, who was soon after promoted.

The following circumstances, though not coming under my own observation, are well authenticated.

Captain Thruston sent a message to General Longstreet—"Captain Thruston sends his compliments to General Longstreet and requests reënforcements, as he has only one man to every panel of fence, and the enemy are strong and very active in his front."

To which General Longstreet replied—"Tell Captain Thruston he must hold his position if he has only one man to every sixteen panels of fence. I have no assistance to send him." This order was strictly obeyed. The regiment remained on that hill and under that fence—with the rails of which the enemy's guns were playing "battledoor and shuttlecock"—from midday of the 17th to ten A. M. of the 18th, with not so much as one drop of water.

While Captain Thruston was riding with General D. H. Hill, on the morning of the 18th, to obtain a regiment to relieve his from the position at that fence, General Hill remarked, "My dear sir, we have too many cowards in our army." To which Captain Thruston replied, "General, you cannot apply that epithet to my regiment, as their fighting yesterday showed for itself." "No, sir," said General Hill; "your regiment fought nobly yesterday"—a well-deserved compliment, and valued more highly as coming from one competent to give, but not profuse in giving, compliments of the kind.

I have never doubted that the remarkable tenacity and bull-dog courage with which that brigade held its position, in the face of odds of ten to one, had much to do with preventing the enemy from penetrating our lines, both on the 17th and 18th.

The inaction of the brigade at Boonsboro' was not of their own choosing, and the fault lay not with them!

William L. De Rosset.

WILMINGTON, N. C., September 24, 1886.

General Lee Trusting in Providence at Antietam.

I HAVE read everything I have ever seen in print in regard to the battle of Sharpsburg, or Antietam, and one incident that may or may not be of importance I have never seen mentioned. About 4 P. M. on the day of the battle, a full brigade of Federal troops—five regiments, I think—forded the Antietam at an obscure ford about half-way between Sharpsburg and the mouth of the Antietam, or, as I remember, about one mile below Sharpsburg, and, being entirely in the rear of the Confederate army, formed line facing Sharpsburg, at right angles with the Antietam, and advanced nearly half a mile. I believed then and believe now that had they made ever so faint an attack, or indeed had their presence been known to the Confederates, nothing could have prevented an entire change of result. I went in person—under orders—to General Lee, and communicated this fact, and was informed that he could do nothing; "that every man was engaged, and he was compelled to trust to Providence." I was gone from my post about three-fourths of an hour, and upon my return found the brigade hastily recrossing the river, and I have never learned what troops they were; nor have I ever heard any mention of this fact!

Frank A. Bond.

Rev. viii. 13.—And I beheld, and heard an angel flying through the midst of heaven,
WITH A LOUD VOICE,

WOE!

TO THE INHABITERS OF THE EARTH, BY REASON OF THE

FROM "THE MIDNIGHT CRY,"

A LITTLE MILLERITE.

EVERYBODY in those parts called it the "Holler." It was X—— in the Postal Gazetteer, and X—— Mills on the letters and papers addressed to its post-office. The mail-bag thrown off there from the stage running between what in the local dialect was called "Fonder" and the Fish House was a heavy one for so remote a clearing in the north woods of eastern New York.

That stage route, in the summer-time, was largely patronized by fishermen — gentlemen from New York and Albany chiefly — off for a Waltonian holiday along the trout streams of Sir William Johnson's old domain. Another class of passengers, going up and down the road in all seasons, were the preachers of the sect called Christians (pronounced *Christ-yans* by their Trinitarian contemporaries), grave-visaged men, to whom the X—— post-office was a kind of Mecca. The rambling building in which it was located was the publication house of the sect. There its weekly magazine was edited and printed, and much of its distinctive literature. The "White Pilgrim" was not unknown to the passengers on that stage route, a "Christian" preacher, whose white apparel and simple eloquence made him famous on his missionary circuit.

The quarterly committee meetings at the X—— office and the frequent conferences of the preachers gave the place a peculiar individuality. That was forty years ago, when postal rates were a considerable item to such a publication "Concern," and therein lay the secret of its location at the "Holler." Its editor and superintendent was the post-master. He was also the pastor of the only congregation in the place, a large one, made up of a few rich farmers, farm laborers, mill hands, and the employees of the "Concern." He was indisputably a man of affairs — a kind of Sir William Johnson in miniature, remembering the difference in the religious and moral character of the two men.

A low, wide dwelling-house, under great locusts, the woods behind the orchard crowding the apple-trees close to the door. Where else under the sun of the State of New York was it ever the fashion to paint window-sashes black, and outside doors all the colors of the rainbow? The house was a melancholy, bilious yellow; but such a glory of flowering vines as it was decked out with, such a smooth-shaven lawn all around it, and beds of pinks and double poppies and cock's-feather and the rest! The great stumps serving for fence-posts were hillocks of bouncing-bets and morning-glories.

Back of the pretty dwelling-house, in full sight from the road, was the "office." Its piazza had an appearance of holding fast to the top of the steep hill over which the building extended in the rear. A steep woody bank — a stream at the foot — little or nothing about the exterior of the building to indicate that it was a printing-office, book-bindery, editorial room, pastor's study, and district-school library.

It is there these reminiscences of a little Millerite properly begin. That house was my childhood's home. My father was the post-master, etc., of the "Holler."

As I remember X—— (and I have not seen it for more than forty years), it was far more prosaic than picturesque, with its dreary common on one side of the main street and a fire-blackened chimney standing in the midst of ruins and brambles on the other. The one discouraged store was usually closed. The roar of the saw-mill dam and the drowsy buzz of its saws kept up a certain atmosphere of activity; but the summers were short and the winters long — the knotty russets hardly gathered before the fences were under the snow.

The beauty of the "Holler" was in the "crik," a tributary of the little Sacondaga of Sir William Johnson's time, — vagrant of the forest that it was, — creeping stealthily out of the thicket as if to see what the mill was scolding about; never meaning to be entrapped into doing a bit of the world's work; rebelling at its moment's slavery to leap the dam for

freedom; scurrying away in a foaming rage; shooting under the bridge of the main street straight into the meshes of the paper-mill, from whose black raceway it made a mad rush for the forest again; muttering, as one child interpreted its sullen roar, that it would never, never be heard from again. Then there was the belt of hoary pines watching the clearing from over the inner wall of beeches and maples—forever watching, it seemed to me, for some one to whom they could beckon, so melancholy were they with being left out there alone in the wind and the storm. It had been sweet waking some morning and finding them gone, if one had never known who cut them down. But the view of a spur of the Adirondacks from a near hill-top was an important part of my life in X——; those far-off heights I dreamed of climbing some day.

Never a spire or turret in the place, nothing but the chimney in ruins for an architectural aspiration. The meeting-house, a mile or less through the woods from the corners, was one of those weather-palsied representations of Zion happily disappearing from the land. The school-house, a poor, lonesome, little red school-house, was a half mile away from the corners in another direction. To have concentrated the religious and educational institutions of X—— nearer the post-office would have caused heartburning in the country round about, no doubt. The "Holler" could not expect to monopolize everything.

A commonplace picture, but a happy home, nevertheless. My father's good people were devoted to him, and he had no higher ambition than spending his days where he had found prosperity and honor. We children used to receive many presents, I remember, nor did we fall short of expecting gifts as a matter of course. Will anything ever bring the joy that came with a *red* flannel rabbit one old lady gave me when the story of the loss of my pet in a neighbor's trap caused so much feeling in the parish? These glimpses of the picture of my childhood are so closely related to what came to pass, they may hardly be spared from reminiscences of the fanaticism sweeping over that home like a withering blast.

II.

IT was in the early summer of 1843 that my father became a convert to the doctrines of William Miller. He was in attendance upon Anniversary Week in New York when he heard the lectures upon the prophecies concerning the second coming, which led him to announce his decision to "leave all" and proclaim the "midnight cry." Leaving all for him meant severing his connection with the publication house, giving up his pastorate, burning his ships behind him, in short. But what need had he of ships if the world was to come to its end that year of our Lord eighteen hundred and forty-three?

My first remembrance of the "tidings" is hearing the doctrine ridiculed. Everybody was laughing at my father's believing what he did, calling him a Millerite, and asking to see our ascension robes. I can remember a consciousness that we had become *peculiar*—a thrust-out feeling which was very painful, a conviction that my father was unjustly and wickedly treated, and that by those he had believed to be his friends. If the world was to be burned up very soon, why should he not make it known? If he did not know the truth of the matter, who did? It was terrible to hear the subject laughed about. Father had taken us children into his study directly upon his return from New York, and, having prayed with us, had told us very clearly what was coming to pass, and that speedily. If we were good children, we would be caught up to meet the Lord in the air, when that terrible trumpet sounded and the mountains were falling and the dead coming out of their graves. We believed every word he said, and the end of one world came to us while he spake.

The excitement in the little settlement was something to be remembered. In the hail of ridicule and persecution my father's faith intensified of course. He could bear ridicule better than the pleading of near friends. We children heard it all, lived it all—what the committee said, what the congregation said, why so-and-so would not hear him preach his farewell sermon, and who had been converted to his new gospel, with all the

Here the ten kings rise & continue until the stone shall smite the Image on the feet & grind it to powder.
 Dan 2. 34. 35. "Thou sawest till that a stone was cut out without hands, which smote the Image upon his feet that were of iron and clay and brake them to pieces; Then was the iron, the clay the brass, the silver, the gold broken to pieces together and became like the chaff of the summer threshing floors, and the wind carried them away, that no place was found for them, and the same that smote the Image became a great mountain & filled the whole earth."
 And in the days of these kings shall the God of heaven set up a kingdom, which shall never be destroyed: and the kingdom shall not be left to other people, but it shall break in pieces & consume all these kingdoms & it shall stand forever. Dan 2. 44.

worldly gossip about the struggle for the post-office and the editorship. Our going away from X—— to live in a great city, the little while longer that time should last, was a merciful diversion for us who saw a martyr's halo around our father's head.

Can any of my readers imagine, unless their early religious experience has something in common with mine, what it was for a child truly to believe all the little Millerite did: that at any moment, terribly near at the latest, there would come that fearful upheaval of the earth, that fiery rending apart of the heavens, and in the indescribable confusion of angelic trumpets, and the shrieking of the damned, God himself would descend with a great shout to burn up the world, the sea, and the dry land?

That was a faith sapping the well-springs of a child's joy—making its life like a path through a jungle; the wild beast, ready to spring, was surely in the thicket, and some day there would be an end of the dread of him. It was something that made waking in the still night a painful experience, and a thunder-storm a fearful ordeal, while every sunset brought the inner voice, "The morning may never come." When I think of the years I repeated in my child's prayer every night, "Have mercy upon me, O Lord, if you come before morning," I see how much in common I had with the little Hindoos; but they were never snatched from their beds at midnight to see a sign of Siva, the destroyer, coming down in his wrath.

There were notable saints among those Millerite children. "Millerite! Millerite! when are you going up?" was shouted at us from the market-place. We were, in a sense, isolated—not considered safe comrades for children whose parents were on the rock of respectable orthodoxy. We looked at the doomed world with wistful regret, and envied those children who did not go to a Millerite hall or a tent upon Sunday, but to a fine church with an organ. But then we were not permitted to forget that the "churches" were "Babylon," and that by and by Babylon would fall, and then would come our reward.

It was in the office at X—— that I remember seeing Father Miller, a gentle old man, shaking with palsy. That was the album and acrostic age. An old lady has shown me what Father Miller wrote in her album one day while he sat there in the office, surrounded by converts and opponents:

"Say, Maria, say, hath Christ thy soul redeemed,
And is thy Saviour by thy soul esteemed?
Religion's blessed spirit, doth this abound,
And grace and mercy scatter light around?
How stands thy reckoning with thy Lord and Friend,

'Midst wreck of matter when this world shall end?
Most Holy Father grant thee wisdom's power,
Amid the storm of wrath in that dread hour.
Rouse up the slumbering mind to watch and pray—
Salvation's coming, he will not delay—
Haste thee and meet him while he's on his way.
"WM. MILLER."

February, 1844, saw us moving away from X——, some of my father's old parishioners, converts to Millerism, carrying us and our goods in their big sleighs as far as Utica—a long journey, the weather bitter cold, the roads blocked with snow. It was a "shovel-brigade," and to cheer our hearts, father and the brethren would sing of "the coming" when they could. They left leaflets at many of the houses we passed,—warnings and expositions of prophecy,—and father preached at the inns where we stopped at night; but the converts were few, if any.

I remember looking back at the old house as we drove by the red pickets which seemed trying to get a good-bye glimpse of us over the drifts, thinking how soon everything would pass away with a great noise. But then my new bonnet was becoming, and I had a smart white muff—a stumbling-block to the good Millerite sister who could not see how father could have bought it, and the *last* winter so nearly over. But another good soul, a dim-eyed old lady who said she never expected to see me again until the grand "rizin'," had slipped a package of molasses-candy inside my muff. So, taking all in all, farewell to the "Holler" was not so depressing as it might have been.

I can hear my father answering in his calm, measured voice, when asked by the landlord how long we would want the house we had taken in R——, "Until the Lord comes." "If time lasts" was the condition of every anticipation and promise. Father brought little furniture for the new home, only what was needed for the free hospitality of a "Pilgrims' Hotel." The walls were covered with charts illustrating apocalyptic and prophetic visions—those realistic conceptions of the supernatural, bewildering one uninitiated in their mysteries. There was a difficulty in keeping a servant in the house, of course, which, with the unreliability and undesirability of the sisters as helpers in domestic affairs, gave my mother little time for attending the meetings—something she did not mourn over. Once, when rebuked for her absorption in the things of this life, she replied that the ascension of saints from her outlook depended entirely upon the stepping-stones they found in sinners.

That was the summer before the tenth day of the seventh month, the 24th of October,

the date fixed upon as the one clearly designated by the prophets of old as the time when all things of earth should be consummated.

It is needless reviewing the argument here. The leaders in Millerism were not illiterate men, but Bible students, who, as a rule, had filled pulpits of comparative eminence before "going into Millerism." The greatest accession was from the Baptists and the Methodists.

The fixing upon the tenth day of the seventh month, "and probably at the hour of even," was the full fruition of the literal interpretation of prophecy—of following the system as far as a literal interpretation could go. The literature of this phase of the fanaticism is abundant and creditable to the writers. The open followers of Father Miller that summer of 1844, the time "the tenth day doctrine" was received by them, exceeded fifty thousand in the United States. The declaration, "Of that day and hour knoweth no man,"—an obstacle in the way of many who admitted the theory in detail,—was removed by the explanation that by searching the Scriptures the believer was to *know*, could not help knowing, when the Lord was nigh. "When ye see these things, *know*——." Could they help knowing what they saw, what they could work out like a mathematical problem?

The few weeks remaining before the consummation of all things were devoted to assembling themselves together for watching and prayer, for combined effort in snatching brands from the burning. At the head centers of the fanaticism daily and nightly meetings were held in some large public hall, while the "big tent" traveled about the country with a force of preachers. The expectancy of the believers grew more and more ecstatic as the time drew near, and the lawlessness of the scoffer in deriding him increased. That the public generally was interested in the subject is proved by an examination of the newspapers of the day, several of them having a special column for "Signs and Wonders" and explanation of singular phenomena. Men's hearts seemed failing them for fear, lest Father Miller might be right after all.

There was no going to school for the children of the consistent Millerite that summer. Sending children to school was counting upon a future, was a denial of faith in the speedy coming. Considering what we had to contend with at school, there was little rebellion on our part. I for one have always felt indebted to the political demonstrations of that summer for saving diversion from prayer-meetings, baptisms, and solemn fast-days. It was the Polk-Clay canvass, and many and great were the processions with coons and cabins, and uproarious songs. The fast-days became

almost continuous as time hastened on, and to us children, at least, the milk and honey of the new dispensation seemed unreasonably postponed. I used to think it very hard that we were not permitted to go to the evening meetings, when the "scoffers" behaved unseemly; but mother would never consent to that, eager as we were to see what the papers described the next morning for the amusement of a wicked world.

How well grounded we children were in the prophecies! The book of Daniel was our story-book. We could play at "meeting," when the pranks of the scoffers were an outlet for our spirits; we could give for a sermon a fair version of Nebuchadnezzar's dream and the interpretation thereof, piling up books and boxes to represent the great wooden image on the preacher's stand at the hall, taking away kingdom after kingdom until nothing was left but "these last days," awaiting the stone cut out without hands. We liked to make pictures on our slates like those on the chart, and to work the mathematical problems of the 2300 days, the 70 weeks, the 1290 and 1335 days. We thought we knew something about "vials" and "woes" and "trumpets," and many things we must have grown grewsome in discussing.

The standard chart never pleased me half so well as that of a Canadian traveling preacher, representing the fulfillment of the signs of "the coming" according to his crude ideas of art as well as prophecy. For the darkening of the sun, there was a woman with a candle, looking up into a tree where what was meant to represent fowls were roosting at what we were told was midday. It was the spectacular display of the falling of the stars from heaven that delighted me most. They were coming down in a brisk shower, children running to pick them up and carry them away by armfuls. Under the picture was this verse:

"Do you remember what you see
In eighteen hundred thirty-three,
When you out of your bed did rise
And see the stars fall from the skies?"

It was a great trial to this brother that he was not encouraged to travel with his chart.

But the meetings as a rule were most wearisome to the little Millerites. Private judgment acknowledging no authority contended with private judgment that would be infallible authority. Naturally on the fast-days the saints even lost their tempers over disputed interpretations. That was the time we children would steal to the rear of the great hall, quite a company of us, and fall to chattering about worldly things, watching the great spiders in

their webs across the windows ; or, if the discussion proved a long one, we would slip down the stairs and go rambling off among the mills of the neighborhood, down to the river's edge, and under the first arch of the aqueduct, hopping from one flat stone to another in the low, swift current, not far above the high falls. Only for Millerism, what had we ever known of the interior of those mills, or learned how far out we dare go on the water-table of the aqueduct ?

Now, if the Millerites had ascension robes, how is it I never saw one ? I well remember hearing them talked about. My ascension robe was something I was quite used to hearing inquired after. Father Miller took great pains to find one, but never succeeded. But the world is never going to give up its belief that the Millerites had long white garments in which they clothed themselves preparatory for "going up." The ascension robe has a place in history in spite of every effort to prove it a myth.

I remember that last day, but not as vividly as I should think I would. Perhaps its terrors had become so familiar to us children that, had they been realized we had met them with stolid composure. In my steadfast faith in my father's love for me I had found comparative peace. I knew he would never shake me from his arms into the fire, and I meant to have a firm hold on him when the crisis arrived. If anybody was saved he would be, and he would never be saved without his family. I kept very close to him as the time drew near, and so was not sorry that the dawning of "the tenth day" found him too ill to rise from his pillow. The strain upon his strength had been beyond his iron endurance. He called us to his bedside, and after a short prayer he sang :

"The last lovely morning,
All blooming and fair,
Is fast onward fleeting —
He now will appear."

That is my only memory of that day. I have no recollection of the high wind at night which snapped off the big Whig pole not far from our house — a terrible storm, frightening many into believing that the end of the world had truly come. Among the interesting incidents of that day, however, was the testimony given by a leading hatter in our city, to his faith in the end of the world before the morrow. Throwing open the doors of his place of business, he invited the crowd to come in and help themselves to hats, umbrellas, etc., which they naturally did. A baker in an adjoining town distributed his bread, cakes, and pies in the same way.

"This is the last issue of this sheet" was the beginning of a leading editorial in one

of the Millerite papers that week. "Before another week has passed, the Lord will have descended from heaven and the judgment of this world will have been consummated." The faith that put that into type was in earnest. One naturally looks for the next week's editorial : "We are yet on the shores of mortality, but He is at the door. He has given a few days more for the trial of our faith. All is in accordance with the parable of the Ten Virgins. When they had arisen and trimmed their lamps there was still to be a season when the lamps of the virgins would be going out. How could that be without a passing by of the tenth day ? Until that time the lamps would burn. There must be a season wherein the foolish may give up their faith. The tarrying time is given to show us how exact the Lord is in fulfilling the letter of his promises."

And the days went on and on. The seventh month was followed by the eighth, the year went out, and another came in. And still He did not come after the manner the Millerite had foretold.

The ranks of the believers were thinned by the disappointment. There was a falling away from the faith with many, a going back to Babylon. But the backsliders were the passive minds as a rule, not the bone and sinew of the movement. The hymn sung by the steadfast during that "tarrying time" floats mournfully down from the past :

"How long, O Lord, our Saviour,
Wilt thou remain away ?
Our hearts are growing weary
With thy so long delay."

They turned to their well-worn Bibles and found abundant consolation in hitherto unnoted missing links of prophecy, chronological chasms, mistaken renderings of the Greek text, miscalculations evolved from the difference between Jewish time and Roman time, etc., etc. They did not slumber, nor suffer their lamps to go out.

Hundreds of the believers who had given their all for the sounding of the "midnight cry" were homeless and penniless when the winter of 1844 came upon them. The scoffers they had warned of sure-coming destruction were merry with full barns, while the ungarnished harvests of the prophets were rotting under the snow. Jonah watching the sky above Nineveh is the type of the disappointed Millerite. Oh, how different had it been with Noah had he builded in vain !

Yea, verily, all things continued as they were, and there was a persistence in that continuance which strangely had little effect upon the confident expectancy of the remnant of the believers — a remnant represented in one of the important sects of Christendom to-day,

Wm Miller

FROM A PAINTING BY W. M. PRIOR.

a body whose members see in every important political event a fulfillment of prophecy, who read their newspapers Apocalypse in hand, and will tell you just how the future map of Europe is laid out by the prophets, and where the battle of Armageddon will be fought. They have lost the name of Millerite. Their fundamental doctrine is the old one of fanaticism, the literal interpretation of Holy Scripture according to private judgment.

The effect of Millerism upon the religious sentiment of to-day, the trend of the world's thought, is not so insignificant as might be supposed. Its effect upon the aggregate is the evolution of its effect upon the individual, upon the children of the followers of William Miller in particular. The Christ of my childhood was not the loving Christ of my later years. He was an offended judge, coming to burn up the world, and how I wished he might be driven out of the heavens, his throne taken by one who would let the world go on as it was! Not until I was a girl in my teens, and one of a merry set at boarding-school, did I lose that sickening dread with which for years I had fallen asleep.

It was at that time I almost ceased saying my prayers, glad when I could forget their omission. Then came the Sahara of Skepticism; how else had been reached the path to a certain faith?

The children of the Millerites are indebted

to their early experience for a quickening of their inner life, which, forced and unnatural as it was, proved their after-salvation from formal acceptance of religious teaching without questioning or doubt. They are to be found, as a rule, identified with orthodoxy, and are characterized by a healthy independence of thought, a tendency to probe for the fundamentals of doctrine. I think it may be said of them that they have a wholesome aversion to the literal interpretation of Scripture, the letter that killeth, as it killed much of the joy of their childhood. "According to that system," they say, "the world would have come to an end in 1843 or 1844. There would have been no help for it." To them Millerism was a spiritual cyclone, clearing away the thick fog of naturalism.

"We cannot understand," wrote Theodore Parker, "the mental and religious state of men who saw the divine in a serpent, a cat, or an enchanted ring; yet each religious doctrine has some time stood for a truth. It was devised to help pious hearts, and has imperfectly accomplished its purpose. It could not have been but as it was. Religious history is a tale of confusion. But, looking deeper, we see it is a series of developments, all tending towards one great and beautiful end, the harmonious perfection of man. Each form may perish, but its truth never dies."

TOPICS OF THE TIME.

To our Readers — In Confidence.

THE larger magazines of our day are evidently made up with a view of presenting such a variety of contents that every intelligent reader can, in each number, find something especially adapted to his or her taste. This is the reason a modern editor so easily comforts himself upon the advent of any one of those numerous advisory or objurgatory epistles which he is sure to receive in the course of a twelvemonth. Bless you, my dear sir, or madam, he says,—at least to himself,—the essay, or story, or poem you have put yourself to the trouble of reading was never meant for you at all! Turn over a few pages and you will find your own special part of the magazine; doubtless, in fact, you actually did so five minutes after dispatching that scathing criticism to the editor of your “favorite magazine.” If you see nothing in Stockton, and want more of Cable and Harris and the rest, remember a letter has just been sent by your next-door neighbor, perhaps indeed by the member of your family who sits opposite to you at the breakfast-table, saying he or she really cannot read Cable, and does not know what Harris was made for, but will take all of Stockton that the new patent steam printing-and-folding Hoe press can supply!

Perhaps no series of articles ever published in a magazine has been followed by so large, so eager, and so persistent an audience as the War Series of THE CENTURY; and yet we are aware that there are some who have found certain of these valuable, and to very many readers intensely interesting, contributions too disconnected, or too technical, or even too warlike (!) for pleasurable reading.

But there are in every number of every magazine articles which are intended to interest, not one class of readers, but all classes. We wish, therefore, to take our friends into the editorial confidence and to say that both the readers of the War Series and those who have not been interested in them will find no difficulty in following with complete understanding the Life of Lincoln begun in the November CENTURY. Here is a connected, logical, historical story, which can be read chapter by chapter for the interest or charm of narrative contained in every separate sub-division of the work; and which can also be followed continuously from month to month for the serial interest of the narrative, which has from beginning to end the sequence and logical progress of a great drama.

In point of fact, even were this Life of Lincoln less lucidly and persuasively written than it is, there would be a sort of patriotic duty in its perusal. This is the book that Lincoln himself helped to make and would wish to be judged by. But it is more than this; for we believe that no other book yet written will be found to contain a clearer and more authentic statement, from the national point of view, of the political origin of the military struggle of 1861–1865. The American who neglects the present opportunity to make himself acquainted with this vital epoch in the history of his country will be less intelligent in his patriotism than the faithful reader of the authorized Life of the great

President. English and other distant readers of THE CENTURY, not a few of whom have found the War Series difficult to master, will be able to follow the Life without confusion, and with a surety of obtaining, as a consequence, a thorough understanding of the man and of his times, of the war itself and of the reasons for it.

But it is, of course, especially to the American reader that the Life of Lincoln has an interest. Both its letter-press and illustrations will be studied by him with something more than ordinary curiosity. Among other things, he will find that Abraham Lincoln, as President of the United States, was no accident of politics; that it was almost as a matter of course that he came to be the standard-bearer of the party of liberty in America. In *this* sense there was no accident and no miracle about Lincoln, as many have supposed. But there was indeed a miracle, and one which grows greater the more it is looked into: namely, the old miracle of individual genius! Why did the boy that fished little Abe out of Knob Creek remain the simple, worthy, but, save for this one act, unknown personage that he still is, while the boy that was fished out became a man fit for the companionship of King Solomon and of Shakspeare? Not a President merely, not a martyr merely,—accidents may create either,—and not merely a Liberator; but a man of such surpassing character and sagacity as to dominate by native right in one of the most terrific conflicts recorded in human annals!

The Eight-hour Working-day.

THE argument for a decrease of the daily hours of labor to eight has taken two forms. One of these asserts that there are now more workmen than are required for effective production, and that a decrease of the daily hours of labor in the case of the employed would bring about a demand for the services of those who are now unemployed, and so “make room” for the latter. This line of argument, though often used in our popular American reviews, may be dismissed as ridiculous. If there were anything in it, its object could be attained as easily by requiring each employed workman to work with one arm tied behind him. “Room” for unemployed workmen is not made by decreasing, but by legitimately increasing production. The introduction of a single new process, such as nickel-plating, is a greater “relief” to unemployed labor than all that trade-unions or statutes could offer. The other line of argument is far more respectable. It holds that the proposed reduction would not operate practically to decrease the amount of production, thus ignoring the problem of “making room” for the unemployed; but that the workman’s cheerfulness, hopefulness, and increased efficiency would make good the decrease in working-time, leaving the saved time for rest, recreation, and mental improvement. Those who advance this argument offer in evidence, as they have a fair right to do, the historical results of previous reductions of working-hours; and the evidence is well worthy of consideration, provided

we bear in mind the essential distinction between the natural and unforced decrease and the attempt to decrease working-hours by statute.

Under early conditions, there may be said to have been two classes of labor, agricultural and artisan. Whether the agricultural laborer were working for an employer or on a corvee, his daily hours of labor were practically equivalent to his waking-hours; and he is probably little better off yet on the greater part of the earth's surface. It seems to be the artisan who has gained most largely. The strongest authority to the contrary is Professor Thorold Rogers. He gives little space in his "Work and Wages" to the subject of hours of labor; but he takes several opportunities to insist that the normal working-day in England in the thirteenth and fourteenth centuries was one of eight hours, so that "the artisan who is demanding at this time an eight-hours' day in the building trades is simply striving to recover what his ancestor worked by four or five centuries ago." And yet, in almost the only two items directly referring to the question, his own evidence states the normal working-days of the past as fourteen and a half hours for agricultural laborers and twelve for artisans. He believes that two and a half hours are to be deducted from these figures for meals; but even then the remainder would be much short of an eight-hour day.

It is most likely that the conditions of early artisan labor, at any rate, were such as to make any comparison or estimate very difficult. The guild system was patriarchal. The master fixed his own hours of labor; his apprentices, like the children of his family, worked according to his estimate of their strength; and his journeymen, or adult employees, though paid by the day or year, evidently worked by conventional piece-estimates; the sawing of a hundred boards, for example, being taken as a day's work. Under such a system, it would not be easy to say what was the normal day's work. The guild statutes, indeed, always ordain that no one "shall work longer than from the beginning of the day until curfew"; but this limit is so generous as to be practically useless. The Statute of Apprentices (5 Eliz., c. 4) provides that daily hours of labor for apprentices should be limited to twelve; and this would seem to point to fourteen or fifteen hours as the outside limit for the stronger journeymen, who answer to our modern workmen.

The industrial change from the domestic to the factory system, toward the end of the last century, consisted in the disappearance of the old guild-master and his family inmate the apprentice, the substitution of the modern individual master or employer, emancipated from guild or other control, and the confusion of the apprentice, the journeyman, and the female employee into one class, the operative or workman. The result was the modern factory. A long struggle followed to transfer the provisions of the Statute of Apprentices to the new order of things; but the masters succeeded in wiping out this last remnant of the old system in 1814. All the new class of workmen were now thrown on self-defense, but burdened by the tyrannical acts against combinations, which gave a criminal character to attempts by workmen to unite to begin or maintain strikes. These were abolished after 1824 in England, though it is but a few years since some of our American States have repealed what had long been a dead letter.

We have now had, for half a century at least, two classes, master and workmen, settling hours of labor by treaty, instead of three, master, apprentice, and journeyman, all bound by guild rules or their survivals; and any decrease has been mainly natural.

Under the new factory system, the masters at first had every advantage over their men; and the hours were for a time increased, sometimes to an inhuman degree. In the long run, the advantage was on the side of the workmen. Collected in great establishments, they felt a new confidence in the presence of their own numbers; and their larger numbers brought public attention more directly upon their complaints and grievances. The daily hours of labor have certainly been decreasing for fifty years in England and America, until they now shift around what may be considered the normal amount of about sixty hours per week.

The decrease has not been accompanied by any falling off in quantity or quality of production. On the contrary, the general rule has been that the working-day has decreased as the labor has become more efficient and has produced more largely. The silk factories of northern Italy are open from five A.M. until ten P.M., the operatives making ninety-four and one-half hours per week, or fifteen and three-fourths hours per day. The contrast between this and the fifty-two hours per week, or eight and two-thirds hours per day, of an operative in an English machine factory, is the extreme; but the superior efficiency of the English laborer makes the shorter hours in the comparison really the longer, measured in results. The same tendency shows itself even within a country. When we leave the localities of the more efficient labor in England, the hours of labor invariably increase. In international comparisons, the English consular reports are a most convenient authority. The following table, cited by Mr. J. S. Jeans, giving the normal hours of weekly labor in the factories of different countries, will show something of this relation of efficiency to contraction of hours of labor:

	<i>Textile Factories.</i>	<i>Machine Factories.</i>
Germany.....	72...	60
France.....	72.....	60
Austria.....	66.....	66
Russia.....	72 to 84.....	72
Switzerland.....	66.....	66
Belgium.....	72.....	62
Italy.....	69 to 90.....	72
Holland.....	72.....	64
United States.....	60.....	60
Great Britain.....	56.....	52

If we consider the question only under the conditions which now affect labor, the general tendency to a decrease in hours of labor, together with the concentration of this tendency in countries of well-known efficiency, as shown in the table above, seems to confirm the historical argument for the eight-hour day. But it seems to show also (1) that, *as things now are*, this tendency has a limit somewhere between nine and ten hours a day; (2) that a decrease to this limit is not made so easily as to the limit of forty or fifty years ago, but meets a resistance more pronounced as the limit is approached; (3) that only a careful organization of labor, having an unusually intelligent consideration for the necessities of the employer, and that in a few very efficient trades and countries, such as the machine factories of

Great Britain, can carry the limit below nine hours ; and (4) the statistics of special trades show that a reduction below nine hours regularly represents the imperative influence of winter weather on certain outdoor occupations, accompanied by the unpleasant result of reduction of wages, and in any event foreign to the special subject under consideration.

However strongly such conclusions may support the argument that decrease of hours of labor does not result of necessity in a decrease of production, it must be remembered that they lend no countenance to the notion that a *statutory* decrease of hours of labor can have any good effect : on the contrary, all the indications go to show that it would have a very bad effect in losing the decrease which efficiency has thus far gained, in banishing capital and business from the place where statutory decrease had been attempted, and in compelling the renewal of the decreasing process in another place and probably under more unfavorable conditions. If capital and labor, under healthy conditions, have carried efficiency of production to its highest present limit, and consequent decrease of hours of labor to its lowest present natural limit, the state of affairs has become exceptionally delicate of adjustment, and any interference can only throw it out of balance, decrease efficiency, and either decrease wages or increase hours of labor in order to make successful competition possible with more favorably situated labor and capital. The desired decrease must be natural rather than merely statutory.

Every indication points us to the belief that such a further reduction in hours of labor, even below the eight-hour limit, is not only possible, but exceedingly probable, if it is allowed to come naturally, not artificially ; that the progress of art and science is constantly tending, where it is unchecked, to make less labor necessary for man's subsistence. Nothing could be so certain to check or destroy this tendency as an organized effort by labor to gain a forced, artificial, and unfair advantage over its employers. When hours of labor are far above the limit possible at the time, statutory interference can do comparatively little harm ; the nearer they approach the natural limit, the more does statutory interference tend to drive them up again. Labor organizations can do very little by striving for a *legal* eight-hour day ; they can do very much by striving to sweep away passion and prejudice, by upholding peace, order, and security, the conditions of efficient production, and by inculcating an intelligent consideration of facts by their members. Only in this way can they gain or approach an eight-hour working-day.

Appropriations and the Veto.

It would not be surprising if, when Congress meets again, the President's annual message should renew the request that Congress approve an amendment to the Constitution, giving to the President the power to veto particular items of appropriation bills while approving the rest of them. Every President of late years has urged this step upon the attention of Congress, and Congress has persistently ignored it, with the exception of a committee report in flat opposition to it. Yet the argument in its favor only gathers strength as the years pass.

The growth of the country in wealth and resources

brings with it an unavoidable change in the nature of its system. A large part of its government tends to take on the character of a machine, and of a machine with which it is dangerous to meddle. Experience, if it has been properly utilized, comes to show about the amount necessary for the annual support of great departments of the Government, and the arrangement of the items of the appropriation bills for them becomes largely a perfunctory office. The annual amount of the great appropriation bills can be guessed in advance within comparatively small limits. To give the State Department, for example, less than a certain amount would only cripple its efficiency for the year, and the normal amount is not difficult to get at. The result is that a percentage of the annual appropriations tends steadily to become a matter of routine.

Such a tendency, if judiciously guarded, would not be at all bad in its nature. It ought, on the contrary, to act in the direction of economy of effort by the appropriating body, by making it certain of part of its work in advance, and by enabling it to give more of its time and effort to the rest of its work. When it does not so act, the fault is regularly in the appropriating body, through its determination to make use of these routine appropriations for the purpose of grasping an illegitimate increase of power over the other departments of government. The knowledge that some of the appropriations have become fixed only moves the legislative body to make these fixed appropriations the vehicle to carry new appropriations by means never designed in the foundation of the political system. The new items are presented to the possessor of the veto power as a part of the routine appropriations, and he must approve all or veto all. The message sent by the Legislature to the Executive runs in reality thus : "We are aware that you have a constitutional voice in the adoption of new appropriations through your possession of the veto power. But we know, also, that some of these appropriations have become fixed through process of time, and that their delay would throw the Government into temporary confusion. We intend to make use of that knowledge to make you approve appropriations of which you really disapprove, and thus to balk a part of your constitutional functions. We send you the routine appropriations, with just as many new appropriations as we dare introduce without absolutely forcing a veto. You must approve or veto the whole mass. If we have calculated correctly, the percentage of new matter is not large enough for you to go to the country with a *prima facie* case for a general veto. In any event, the people will be apt to hold you, rather than us, to be the responsible party for any confusion in the Government, so that you had better quietly sign the whole." If such a message were really sent *ipsis simis verbis*, what self-respecting Executive could do anything else than accept the challenge and impose the veto ? And yet, how else can the action of the legislative body be interpreted ?

The political organization of the States is so closely similar to that of the Federal Government, that the pressure of this evil has naturally been felt in the States as well. As constitutional change is easier in their case, the remedy has been applied by some of them in the form of a modification of the veto power, allowing the Governor to veto detached items of an

appropriation bill while approving the rest. The change was introduced by Georgia in 1865, and was followed by Texas in 1866, by West Virginia in 1872, by Pennsylvania in 1873, by Arkansas and New York in 1874, by Alabama, Florida, Missouri, Nebraska, and New Jersey in 1875, by Colorado in 1876, by California and Louisiana in 1879, and by Illinois in 1884. There are thus fifteen of our States which have adopted this provision. If we deduct from the remainder the four States which give their Governors no veto power, and class as doubtful the States in which the veto may be overridden by a mere majority vote of each House, we shall find that the list given comprises a remarkably large proportion of the States in which it would be effective. Another point which deserves notice is the fact that the list includes so large a proportion of the States which have great expenditures and business interests to care for, and are therefore more likely to feel the pressure of the evil and to seek for a remedy. Whatever other remedy may be suggested, that which has been approved and adopted by California, Georgia, Louisiana, Missouri, New York, New Jersey, and Pennsylvania is fairly entitled to respectful consideration.

The amendment, as adopted by Georgia, was brief, providing that the Governor "may approve any appropriation and disapprove any other appropriation in the same bill; and the latter shall not be effectual unless passed by two-thirds of each House." The forms adopted by other States have shown a tendency to become more complicated, in order to avoid possible misunderstandings. That of New York, probably the most complete which has been devised thus far, is as follows:

"If any bill presented to the Governor contain several items of appropriation of money, he may object to one or more of such items while approving of the other portion of the bill. In such case, he shall append to the bill, at the time of signing it, a statement of the items to which he objects; and the appropriation so objected to shall not take effect. If the Legislature be in session, he shall transmit to the House in which the bill originated a copy of such statement, and the items objected to shall be separately reconsidered. If on reconsideration one or more of such items be approved by two-thirds of the members elected to each House, the same shall be part of the law, notwithstanding the objections of the Governor. All the provisions of this section in relation to bills not approved by the Governor, shall apply in cases in which he shall withhold his approval from any item or items contained in a bill appropriating money."

The New York amendment could easily be adapted to fit the Federal Constitution; and it is evident that it would at once remove the power of Congress to force new appropriations upon the President through the medium of the routine appropriations. Another evil, almost peculiar to Congress, would still remain. Congress would still have the power to insert new legislation, what are known as "riders," in the routine appropriation bills, and thus attempt to evade the President's legitimate veto power. The bill might still be made to state that "none of the appropriations herein contained shall take effect unless" something is done which Congress wishes and the President is known to oppose. The use of the word "paragraph" instead of "item" might perhaps put an end to both mischiefs at one blow.

There is but one argument against the proposed amendment which there is any difficulty in meeting,

and the opposition will undoubtedly turn upon it. It will be argued that the change would so diminish the power of Congress, and so increase that of the President, as to make the latter absolute over the appropriations. The argument ignores many essential features of the case. In the first place, the proposed change is no more than a definite separation of the routine from the temporary appropriations, leaving each to be dealt with in its appropriate fashion. Congress may still make the routine appropriations what it will, and the President will have no power to increase them; it may introduce what new appropriations it will, and the President will have no more than his constitutional voice in the matter. The only effect of the change will be to preserve to the Executive his constitutional function, which circumstances tend strongly to diminish. The framers of the Government could not have foreseen that so large a part of the appropriations would come to be settled in practice, so as to need comparatively little discussion and to be merely a weapon in the hands of Congress for the coercion of the Executive. The proposed change will only restore the balance to what it was originally meant to be.

Again, the argument ignores the fact that the change has already been tried in practice, and that none of the States which have adopted it show any disposition to abandon it. Are we then to conclude that fifteen of our States, including some of the wealthiest, have given their Governors absolute power over the appropriations? Has the change made Governor Hill any more a despot in New York than was Governor Dix? The States are the very best of fields on which to try such experiments; but when this field has been used, are the results to be altogether ignored?

Finally, the argument ignores the fact that it is really the Legislature which has secured almost absolute power over the appropriations, through the natural growth of routine appropriations and the possibility of inserting temporary appropriations therein. This is the evil which the States have guarded against, and the Federal Government is only asked to profit by their experience. To assume that the evil is itself good, and that any proposed remedy is itself an evil, is hardly sound logic. It is true that Congress hardly ever attempts to use its power to the full limits, for fear of exposing the evil to plain view by forcing a veto of good and bad appropriations alike; but this means no more than that the firmness of the President is the measure of the modesty of Congress. Congress lays claim to an arbitrary power which was never meant for it; and the results can hardly be better stated than in the quaint words of Franklin in 1769:

"The arbitrary government of a single person is more eligible than the arbitrary government of a body of men. A single man may be afraid or ashamed of doing injustice; a body is never either one or the other, if it is strong enough. It cannot apprehend assassination; and, by dividing the shame among them, it is so little apiece that no one minds it."

It is much to be desired that, at this session of Congress, some organized effort shall be made to bring about a consideration of the proposed amendment, as a remedy for a growing evil, which has more than once thrown the government into at least temporary confusion, and which may yet threaten worse consequences, when it shall be too late to remedy them.

OPEN LETTERS.

The Union of the American Churches.

FROM A METHODIST EPISCOPAL POINT OF VIEW.

THE discussion in *THE CENTURY* of the feasibility of a more perfect union of the American churches has taken a wide range, and included a great variety of topics. It is not clear that the writers of the articles already printed are aiming at the same object. Doctor Shields* is asking, or at least hoping, for an organic unity of our churches, to be effected hereafter by common consent. He defines organic unity to be "such unity as inheres in their internal organization." Is there not here a confusion of ideas? The unity of the churches is an established, a divine fact, and that unity is necessarily organic. The church is already one by virtue of the life which pertains to all its members, as members of Christ. Paul's account of this unity is very clear. "For by one Spirit are we all baptized into one body, whether we be Jews or Gentiles, whether we be bond or free; and have been all made to drink into one Spirit. For the body is not one member, but many. If the foot shall say, because I am not the hand, I am not of the body; is it therefore not of the body? . . . Now ye are the body of Christ and members in particular (severally members thereof)." If such opposites as Jews and Gentiles could in the Pauline period be one body, much more can the Christian opposites of the modern period enter, through the life-giving Spirit, into the composition of one body. Paul's idea is then of a divinely created unity of the church, which subsists in all ages, which remains the same, whether Christians recognize it or not. As the human race is one, being of one blood, notwithstanding the wars which nations wage with each other, so the church is one, notwithstanding the conflicts, spiritual and carnal, which Christians are waging with one another. As in the one case the conduct of men, so in the other the conduct of Christians, is out of harmony with divinely established relations. And that this unity, created by the Spirit, is organic, Paul additionally shows when he says to the Ephesians: "[That we] may grow up into him in all things which is the head, even Christ: From whom the whole body fitly joined together and compacted by that which every joint supplieth, according to the effectual working in the measure of every part, maketh increase of the body unto the edifying of itself in love."

There is small hope of profit from a discussion which begins with a confusion of terms; which sets out to create by human means a condition already established by divine means, and which asks men to do what it is not in the power of all men, however combined, to accomplish. The Christian Church is not a dead but a living body; and its unity consists, as already stated, in the life which it has derived from its head, through the ministration of the Holy Spirit.

Dr. Shields, looking for organic unity by human means, proposes to find it for the United States in the

combination of the American churches, Protestant and Catholic, under one government or confederacy. They would then be the united Christian churches of America. He proposes as a means to this end an agreement either in doctrine, or in polity, or in liturgy; the first two are, however, dismissed as being, for the present, unattainable. The respected representatives of the Protestant Episcopal Church concur in this suggestion of a visible organic unity, and offer, as the readiest means of attaining it, the acceptance by the American churches of Apostolic succession. We cannot doubt that this offer is made in all sincerity. But it involves several difficulties. First, it makes the unity of the church consist in an external organization. If this be so, the church has been without organic unity ever since the Greeks and Latins separated from each other; and has been much worse off since the Protestants broke away from the Latin Church. Again, only one of the three successional churches, Greek, Latin, and Anglican, can be the true church; for there is only one body of Christ, and if unity consists in an external organization, it rests in one only of the three. Which shall it be? † But a third and more important difficulty is found in the fact that the majority of the Protestant Christians of the United States attach no value to an Apostolic succession derived through bishops. They do not see how the bestowal of it can effect the unity of Christ's Church.

We might well pause here to ask the question, "Suppose all the churches of our country to be under one government, what would be the good of it?" Would we really be better off? Would we not have in place of our present elastic ecclesiastical mechanism one so cumbrous that much movement would be well-nigh impossible? Does not the gain which we derive under our system of the separate action of churches more than balance the supposable loss from the lack of administrative unity? The progress of Christianity in the United States during this century has been one of the most amazing facts in the history of the century; and is not this largely due to the independence of action enjoyed by each group or family of churches? Must all this abounding energy be tamed down under the pressure of a dull, dreary uniformity? For my part, I should dread the effect, conceiving the thing possible, of bringing the American churches under a single administrative unity. Where would Methodism have been, if, before proceeding upon its career of evangelism, it had had to wait for orders from some central power? That system which leaves most room for spontaneity of action is far the best, at least for Protestantism. For myself, I have a dread of over-much ecclesiasticism; the trouble we had to get clear of Rome ought to be a reminder to us Protestants that a concentrated ecclesiastical unity is sure to be a concentrated ecclesiastical tyranny.

I confess that I rubbed my eyes when I read Dr.

† Cyprian holds that salvation is possible in *one* external organization only, which alone is the church.

* In *THE CENTURY* for November, 1885.

Shields's proposal to unite American Catholics and Protestants in one ecclesiastical government, as though it were conceivable that Catholics would recognize any other authority than that which is seated at Rome. But I was still more astonished when I found him calling Protestantism one extreme, and Roman Catholicism another, and asking if we may not "look somewhere between these extremes for the path of wisdom and safety." Has he fully weighed the import of these words? Let us see what they really mean. There are, and for the purposes of this discussion it may be said that there can be, only three forms of Christianity. First, that which recognizes one mediator only between God and man; second, that which recognizes human mediators, as necessary to salvation; and third, that which denies the need of any mediator. The third of these forms, known in America as liberal Christianity, may be dismissed from present consideration; the questions of modern life pertain to the other two. Now I think that the essence of Protestantism consists in our deliverance from dependence upon human mediators and human mediation. In other words, Protestantism has taught us that every Christian is his own priest, and can go directly to God through Jesus Christ, for the blessings of forgiveness of sin and a new life. He does not depend for pardon on the judicial act of a human priest. This may seem to the secular mind a small distinction, but it has most important consequences in the civil, social, and political life of the world. The doctrine that all Christians, as priests, are equal before God has as its corollary the doctrine that all citizens are equal before the law. The church governed by the universal priesthood, all whose members are thus equal, precedes in modern history the state governed by the body of equalized citizens. The divine republic is the parent of the political republic. Under the sacerdotal system of a limited human priesthood, the believer remains morally a child; under Protestantism, he grows to manhood, being educated in a sense of his direct responsibility to God. Under the one system he is taught that he must give answer for his conduct to God and his conscience; under the other, that he must give answer for conduct to a human priest, who can bind or loose the soul at pleasure. All that the modern world has gained of progress has been achieved by the overthrow of sacerdotal Christianity. We but state a truism when we say that but for such overthrow there would have been no modern world. Modern civilization has been made possible solely by the denial of the right of the human priest to absolve man from sin. Politically, as well as spiritually, we are the children of the Reformation. Not only is this true of Protestant states, but Catholic states, in order to enter upon the path of progress, have begun by the overthrow of sacerdotal Christianity. Italy, as a state, breaks with the church in order to recover her autonomy; Mexico does the same; united Germany the same; France did the same in the revolution of the last century. The sacerdotal principle is, in these cases, denied as far as the state is concerned; for sacerdotal Christianity claims supremacy over the state as well as over the individual. All modern progress has, therefore, been conditioned upon the rejection of a human priesthood.

What Doctor Shields asks of us is to look somewhere "between the extremes of Protestantism and

Catholicism for the path of wisdom and safety." Safety in what? In religion? Surely not. In morals? Again surely not. In politics? Shall we forsake the liberty wherewith Christ has made us free, and again be subject to bondage? We maintain that in the matter of progress Protestantism has the right of way, and that to it alone we must look for the solution of the spiritual and political problems of the age. There is no middle ground between Protestantism and Rome, because there is no middle ground between the principle of one only divine mediator and the principle of a body of human mediators reconciling man to God.

It is startling to hear a Presbyterian speaking of Protestantism as an "extreme." I have always read that Protestantism is the recovery of New Testament Christianity; and if it is extreme, it is only so as the New Testament is extreme. Its formal principle is the rejection of the coördinate authority (with Scripture) of human tradition in matters of faith and practice, and a very precious principle it is. How is it possible to bring into the unity of one administration systems of such opposite ideas as are the Protestant and the Roman? It may be asked, Is, then, our outlook for the future an outlook upon a never-ending series of theological and ecclesiastical conflicts? My own opinion is that as the states have overthrown the sacerdotal principle in order to recover their autonomy, so will the individuals composing the states follow in the same line of direction. The states have taken the first step, the individual members of Catholic nations will follow. I cannot believe, therefore, that the drift of American Christianity, or, for that matter, of the churches of Europe, has been towards a middle position between the extremes of Romanism and Protestantism. As for the American churches, their drift has been more and more towards Evangelicalism, which we may call Protestant radicalism, inasmuch as it includes a most positive denial of the sacerdotal principle. Statistics prove beyond question that evangelical, as distinct from sacerdotal, Christianity is the faith of the vast majority of the American people.

We come next to the means proposed by Dr. Shields for the organic unity of the American churches, to wit, the adoption by them of the English Prayer-book. We can safely leave the Roman Catholic — for he is included in this scheme — to make his own answer. But we can fancy him saying: "My prayer-book has a central idea, the offering up of the body and blood of Christ for the sins of the people; but yours is a thing of shreds and patches, without any principle of unity whatever. It has borrowed so much from every quarter that its meaning is the perpetual puzzle of the Protestant ages." This would be irreverent, but I fear expresses substantially the Catholic estimate of the English Liturgy. As to the power of this book to become a bond of union among American Protestants, one fact completely overthrows all of Dr. Shields's hopes. The Methodists have inherited the English Liturgy; a revision of it was provided for them by Mr. Wesley when he organized them into a church in 1784. Most of this service-book has been retained, the chief exceptions being the forms for morning and evening prayer. The baptismal, the marriage, the communion, and the burial services, the forms of ordination, have been, with important excisions, in use among the Methodists for a century; but dur-

ing all this period they have been moving farther and farther away from the Church of England and its representative in this country. The Church of England has seen since 1833 a great revival of what are called Church principles; Methodism has been diverging more and more from Church principles. The prospect of a union of Methodists with Anglicans, on the ground of a common liturgy, is *nil*; meanwhile, aggregate Methodism has grown to be as large a body as the total of Anglicanism, yet with each succeeding year Methodists are more resolved to maintain their independent position. The truth is, the two bodies are, in their practical work, moving on different lines, and could not coalesce without injury to both.

Is there, however, no way out of the present merely formally fraternal relations of the Protestant churches with one another? Can we not come to a closer union? It seems to me that we should

I. Recognize the organic unity of the churches as a divinely established fact, and seek not to create that unity, which is impossible for us to do, but to find for it a better expression in our church life;

II. Enter into a closer coöperative union as a means (1) of thereby declaring our essential unity, (2) of cultivating spiritual fellowship, (3) of better maintaining Christian morals as against practical ungodliness, and Christian faith as against unbelief;

III. Recognize for decency's sake, if no more, one another's churchly standing, so that the efforts to obtain a more perfect union may not carry upon their face an aspect of insincerity.

The limits assigned to this article will not permit any elaboration of the second and third propositions.

George R. Crooks.

George Bancroft on the Legal-Tender Decisions.

UNDER the above head, "Topics of the Time" for May contains an article in criticism of the decision of the Supreme Court of the United States of March 3, 1884, in the case of *Juillard v. Greenman*. Of this decision it speaks as "the worst possible decision that the subject admits of"; of its "monstrous doctrine"; of it as evincing ability to prove "that a horse-chestnut is a chestnut horse"; and as one readily lending itself to sarcastic treatment.

Beside this, it summarizes, with approval, Mr. Bancroft's effort, in which one is to find justification of the above characterizations. Of this summary the first point is that Mr. Bancroft "shows that when the framers of the Constitution came to that branch of the instrument which treats of the public finances, they solemnly, and by the vote of nine States against two, cast out of it the power to 'emit bills of credit.'"

Passing directly to the consideration which might connect this historical fact with the subject in hand, the very pertinent question is stated: "What were bills of credit?" Then this answer is given: "Mr. Bancroft shows by a careful turning of the colonial records that bills of credit were nothing else than Government legal-tender notes."

This statement it then follows into two distinctions, with a carefulness which would have been highly commendable had the statement itself been correct. But

it is not correct. It is a misstatement, substantial and fundamental, to the matter under consideration—one which turns awry the main argument. It is here, where good standing was absolutely essential to Mr. Bancroft's success, that the ground fails him.

Bills of credit are something else than Government legal-tender notes. They are Government notes. There is the difference. They are Government notes, whether they are legal tender or not. A Government note which is not legal tender is a bill of credit. It is a bill of credit as fully—a bill of credit to all intents and purposes as known to the Constitution—as though it were legal tender. The ordinary treasury note, issued long before our late war, was a bill of credit as much as is the present legal-tender greenback. Every bill of our present National Banks which is now in circulation and serving the wants of our community is a bill of credit.

The pertinent question, which this summary states, has been put to the Supreme Court, and has been answered. The answers are now ancient: given in 1837 and 1830, one by Chief Justice Marshall himself,—answers apparently unknown to Mr. Bancroft and the writer who summarizes his pamphlet. The term "bills of credit," as then judicially defined, comprehended all Government notes issued to serve as currency. No difference was recognized between such paper which was, and such paper which was not, legal tender. It was, all alike, bills of credit. (*Craig v. Missouri*, 4 Peters, 410; *Briscoe v. The Bank*, 11 Id., 257.)

The court did not leave this point to be matter of implication. They expressly decided it. It was urged upon them that the paper then at bar was not a bill of credit, because it was not (as, in fact, it was not) legal tender; and the court declined to sustain the point thus taken. They decided the paper in question to be a bill of credit, when it was not impressed with the quality of legal tender. (*Craig v. Missouri*, before cited.)

Thirty years and more later, the court again considered this subject; and they then definitely declared that the bills issued (as now) by our National Banks were bills of credit. They were bills of credit of the United States, because the United States was responsible for their redemption: that is, ultimately. (It is well known that these bills are not legal tender.) (*Veazie Bank v. Fenno*, 8 Wall., 548.)

Such Government paper—that is, paper issued to serve as currency, resting on the pledged faith of the Government—had been issued by the United States, as occasion required, for more than fifty years.

And now the court declared, on the authority of this repeated practice of the Government and of uniform previous decisions, that the United States was authorized to emit bills of credit.

This decision was announced by the late Chief Justice Chase, who afterwards gave the opinion against the constitutionality of the legal-tender laws; and to the point here stated it was the opinion of a unanimous court. Mr. Bancroft and the writer in the *MAY CENTURY* both see what escaped the attention of the learned Chief Justice—to wit, that that decision carried with it the constitutionality of the legal-tender laws. They rest their case against those laws on the want of power in Congress to emit bills of credit; and Chief Justice Chase, as the mouthpiece of the court, affirmed that power.

Congress does possess and has long exercised the constitutional authority to emit bills of credit. And this authority includes the authority to make such bills legal tender. Congress, being authorized to emit them, may make them legal tender or not, at its discretion.

Beyond this brief consideration of this strongest point made by Mr. Bancroft, your magazine cannot afford me space.

Thomas H. Talbot.

THE three decisions or declarations referred to by Mr. Talbot in the order of their dates are :

1. That certificates of indebtedness issued by a State (Missouri), bearing interest and intended to circulate as money, are "bills of credit" within the prohibition of the Constitution, and therefore void.

2. That the notes of a bank, the capital of which is owned wholly by a State (Kentucky), and the officers of which bank are appointed by the Legislature, are not "bills of credit" within the meaning of the Constitution.

3. That the notes of a National Bank, no part of the capital of which is owned by the National Government, are "bills of credit" within the meaning of the Constitution.

It would be easy to show that the second of these opinions is inconsistent with the first, and the third with the second, but this is not now important, since all three agree upon the point that the legal-tender character is not essential to "bills of credit" within the meaning of the Constitution. Mr. Talbot is so far right in his contention. But Mr. Bancroft is not wrong. He does not affirm that legal tender is or was an essential feature of "bills of credit" anterior to the adoption of the Constitution. The mistake of quoting him to that purpose was our own. How far this error was fundamental to the purposes of the article in the May number of *THE CENTURY* might be made the subject of a separate discussion, but such discussion would neither invalidate Mr. Bancroft's argument nor advance the interests of legal or monetary science. In order to recast the article upon Mr. Bancroft's lines, it would be necessary to say that, the right to issue a Government paper currency being prohibited, still more is the right to make such currency legal tender between private individuals prohibited. The fact that treasury notes were issued by the Federal Government, which passed into circulation (and were probably intended to) prior to the year 1861, does not carry overwhelming presumptions in favor of their constitutionality, since the right to issue them was always challenged. As late as 1844, the Secretary of the Treasury, having put out a few treasury notes bearing only a nominal rate of interest, the Committee of Ways and Means of the House, in a very able report rebuking this operation, drew the line of demarkation between treasury notes and bills of credit, holding that the former, being in the nature of temporary loans, payable at a definite time with interest, were allowable, while the latter, being intended for a paper circulation payable on demand, were prohibited, the power to issue them having been not merely not granted to the Congress but expressly refused. (See Knox's "United States Notes," pp. 53-61.)

Mr. Knox (p. 20) summarizes the note issues of the Government as follows:

"No notes were issued from 1789 to 1812, a period of 23 years. Notes bearing interest were issued in the years 1812, 1813, 1814, and 1815, and at various dates from 1837 to 1847. They were again issued in 1857, and subsequently in the years 1860, 1861, and thereafter. The periods for the issue of these notes may be summarized as follows: first, the war of 1812; second, the financial crisis of 1837; third, the Mexican war; fourth, the financial crisis of 1857 or during the Buchanan administration; and fifth, the war of the rebellion. It will thus be seen that there have been *four* emergencies in which Congress has seen fit to authorize interest-bearing notes, and only *one* in which it has authorized *bills of credit*, or circulating notes payable on demand in lawful money."

The Writer of the Article.

Practical Help for Ireland.

[AT our request, Mrs. Ernest Hart of London has prepared the following description of an interesting experiment which has attracted much attention in England and, we are informed, is to be undertaken in America, viz., the systematic revival of cottage industries.—EDITOR C. M.]

IN the spring of 1883—a period of great distress in Ireland, and especially in the congested villages of Donegal—my husband and I visited that region in order to re-study the Irish question and the causes of Irish misery. Here we found, separated from the more prosperous parts of Ulster by vast bog-lands, thirty to forty miles in extent, crowded colonies of Celts, a primitive Catholic people, speaking but little English, the descendants of the "mire Irish," who were driven out of the "fat lands" of Ulster in the settlement of James I. These "idle Irish" have by a most laborious process reclaimed every inch of soil from the ungenerous bog-land, built their own cottages, and drained and trenched and flanked their farms entirely by spade labor; but during that and previous bad years they would have starved but for money sent from America, and for relief given in seed-potatoes by their old and constant friends the Quakers. Yet everywhere in these crowded and famine-stricken villages we heard but one demand, and that was for work. A brave, simple, independent, and penurious people are these Donegal peasantry, and work we determined to give them; but how? Could poor, far-away Donegal compete with the thousand mills of Bradford and Manchester? Reflection on the peculiar conditions and capabilities of a peasantry rooted in the soil, but willing to work at home industries, bade me hope; and in spite of wise political economists who told me I could not put back the clock, that I was attempting the impossible, I determined to try to revive, with the aid of the modern influences of art and science, the old cottage industries which once flourished among these people. A Donegal "farm" consists of from five to ten acres of bog-land that has to be reclaimed, and the "farmer" migrates in the summer to England or Scotland as a farm-laborer; if during the long winter months of enforced agricultural idleness he and his family could be employed at some industry that could be pursued at home, it would, I thought, be sufficient to lift the family out of destitution, and the recurrent spring famines would be forestalled. What could the people do? They could spin, weave, knit, embroider, sew, and make lace. Spinning was and is still done on the primitive large wheel, the wheel being turned with one hand, while the thread is manipulated with the other. The carding was careless and the thread

uneven; the weaving was slovenly done in narrow looms which have not even the flying shuttle, and the rough gray cloth made had no sale in the large towns. There were, however, many excellent knitters, as the knitting industry, owing to the cheapness of labor, had survived; but embroidery or "sprigging" had been killed outright by Swiss machine competition. To make a long story short, I set to work to remedy these defects and then to find a market for the goods. I sent yarn and wool and patterns, with careful and minute instructions, into the mountain villages; I established agencies in the most remote districts; I insisted on the exact fulfillment of orders, and gave technical information about dyeing, washing, weaving, etc., and now, after nearly three years' steady cultivation of these industries, homespun, made entirely by hand, are turned out of these village looms, which compete with the Scotch in texture, quality, and price, and which are bought by Poole and other fashionable tailors, as well as patronized and worn by Mr. Parnell. The peasants also produce hand-knitted hosiery and gloves, which have taken the highest awards; delicate hand-sewn under-linen for trousseaux and outfits, and needle-point laces fit for bridal dresses. The benefit to the people is not only in the money which now comes into these poverty-stricken villages, but also in the impetus thus given to Irish home industries and the encouragement to good work. These forgotten peasant folk have been brought into communication with the outside world; they have been lifted out of their despair, and have been taught that by intelligent industry they also can claim a position as workers in the world.

I have left it to the last to speak of the "Kells Art Embroideries," of which an exhibition will be opened in New York at the rooms of the Associated Artists in December. In the need which I felt to find employment for the skilled embroidery workers of Ireland, I chanced to hit on a happy idea, consisting in the use of polished flax threads of beautiful tints, worked in a broad and effective manner on flaxen materials in designs suggested by the Irish illuminated MSS. of the seventh and eighth centuries. This, primarily, is the "Kells Flax-on-Flax Art Embroidery"; but other fabrics and designs are now included under the designation, and much of the work

shown in New York will consist of silk embroideries in Celtic designs on cloth spun, woven, or dyed by the Donegal peasants. These embroideries won the gold medal at the International Inventions Exhibition of 1885; nearly all the members of the royal family have purchased specimens of them, and the Queen recently gave us an order for a pair of "Kells" embroidered curtains. In this industry not only peasant girls, but destitute ladies — the innocent victims of the present crisis — are employed. Altogether the Donegal Industrial Fund employs in Ireland nearly one hundred embroiderers, one hundred and twenty spinners and weavers, four hundred knitters, and numerous other workers. Springing but three years ago from the smallest beginnings, a few pounds of money and a few pounds of yarn, the Donegal Industrial Fund, for which my husband and a few private friends have subscribed the necessary capital, — still all too small, — has now a growing business, a handsome depot in London at Donegal House, 43 Wigmore street, and agencies in most of the large cities in England, in Melbourne, New York, etc. The basis of the undertaking is the sharing of profits with the workers.* We and those who act with us desire no recompense but to see the artistic success of the enterprise and the benefit of the Irish peasants. If larger funds were available other industries, such as basket-making, wood-carving, toy-making, etc., could be developed, the present success placed on a firmer footing, the methods of working improved, and the means of finding markets increased. Why should not the silent and lonely valleys of Black Donegal, through which numerous rivers run to waste, be made as merry with water-mills as the uplands of Bohemia, Saxony, and Bavaria? In these countries the steady and intelligent cultivation of small industries is beginning to make one factor in German competition with even the great industrial forces of Birmingham and Manchester. At the bottom of the political question in Ireland is the agricultural question, and at the bottom of the agricultural question is the economic question. To treat the symptoms only is not sound medicine.

Alice M. Hart.

* I may mention that our accounts are audited twice a year by Messrs. Price, Waterhouse.

BRIC-À-BRAC.

Uncle Esek's Wisdom.

A GOOD memory is no evidence of superior intelligence.

THOSE who have a great deal to say, say it in a few words.

WE cannot spare any of the passions, for what are the virtues but the passions subdued?

ALL simple people are not great, but all great people are simple.

I BELIEVE in the immortality of the soul, not because I *can* prove it, but because I *can't*.

Uncle Esek.

A Rhyme of the Corn-field.

UP at early morn,
A-plowin' out corn
In the ten-acre lot.

I foller the row,
Whistlin' as I go.
Goodness, ain't it hot!

Sun two hours high —
Suds, but I'm dry!
Guess'll go'n' git a drink.

Been't the house most'n hour,
An' now't's goin' to shower.
Have to stop, I kinder think.

An hour's noonin' past,
Back to work at last —
 Didn't rain, after all.

Plowed five rows more;
Now't's half-past four —
 Wish the hired girl'd call.

Down goes the sun;
Only ten rows done,
 Not two hours' stiddy work.

D'ye reely want to know
Why I've been s'awful slow? —
 'Taint because I'm a shirk.

I kinder hate ter tell,
But I guess I might as well —
 No, it ain't any hoax.

Won't wonder I worked slow,
I guess, when you know —
 She's a-vis'tin' our folks.

Maurice Perkins.

In a note to the Editor Mr. Perkins says:

"I have been a farmer boy, and I give, in my crude way, a suggestion of the action of 'plowin' out corn' in the measure of the rhyme. That which I have accomplished, however, is a perpetuation of the peculiar rural Wolverine dialect used in southern Michigan. My friend, James Whitcomb Riley, has given us to perfection the Hoosier dialect, but the Wolverine differs from it in some particulars, notably the frequent use of 'guess,' etc.

"If one has ever followed a hop-skip-and-jump shovel-plow through a corn-field on a hot day, with his sweetheart visiting at the house so 'aggravating' near, he will see something in the rhyme that suggests those glorious days when love made him commit the sin of shirking his duty."

Lines to a Very Shy Young Woman.

FALSE Violet ! I sought for thee,
That I might know
If thou didst bend so low
Prompted by tender modesty,
— Or show !

I will disclose thy subtlety :
Looks that are shy,
Thou know'st, do win mine eye—
(This truth, fair maid, I challenge thee,
Deny !)

And so, since it becometh thee
And charms my heart,
Thou dost affect this part !
Thus, all thy sweet simplicity
Is art.

Margaret Deland.

Uncle Gabe at the Party.

DE twangin' ob de banjo an'
De scrapin' ob de fiddle ;
Tak' my arm, Mis' Dinah, an'
We'll sashay down de middle.
Dinah's jis' as fin' a gal as eber you did see,
I'se sumpin' ole, Mis' Dinah, wid a twitchin' in de knee,
But keep a-goin' !

Swing ya pardners, gen'lemen,
An' don't ya stop to t'ink.
Run aroun', Mis' Dinah, lik'
De turkey 'fore de mink ;
Cæsar's aftah Dinah, an' 'e tryin' to ketch her sho' ;
I'd keep up wid 'em bettah, but I ain't so peert no mo',
But keep a-goin' !

'Pears to me de dancin' am
A-gittin' mighty fas' ;
Dinah's skitin' up de front,
An' I is mos' de las'.
Gosh ! ole nigga, hurry up, dey'll leab' ya 'way behin' ;
An' dere's dat Cæsar grinnin' lik' his teef was melon-
rin' !

But keep a-goin' !

De yaller moon's a-shinin' on
Ole Farmah Taylah's patch ;
Wait until we'se 'gwine hom',
We'll take a leetle snatch.
Dese awful red, dese awful green, de seeds is black as
Satan ;
Jis' jump aroun' heah, chillern, fur de watermelon's
waitin' !

Ur ! he ! he !

Duvva Morgan Smith.

Momentous Words.

WHAT spiteful chance steals unawares
Wherever lovers come,
And trips the nimblest brain and scares
The bravest feeling dumb ?

We had one minute at the gate,
Before the others came ;
To-morrow it would be too late,
And whose would be the blame !

I gazed at her, she glanced at me ;
Alas ! the time sped by :
"How warm it is to-day," said she ;
"It looks like rain," said I.

Anthony Morehead.

The Perils of a Poet.

LORINDA was a poet born,
And at the age of twenty,
With life and fame in peachy bloom,
Of lovers she had plenty.

It happened just about this time
Appeared her masterpieces ;
Soon after which, lo ! one by one,
Her lovers' list decreases.

"What does it mean," Lorinda thinks,
"That lovers thus forsake me ?
With doubled fame, I am as fair
As Nature well can make me.

"Yet Paul Divine glanced right away,
When at him I was gazing,
Indifferent, proud, when once his look
Set both my cheeks ablazing.

"And Gabriel withdrew his hand
As mine went forth to meet it ;
When only just a week ago
He would have knelt to greet it."

Ah ! ah ! the light is breaking in :
The maid at last discovers
That verse which has attracted fame
Has been repelling lovers.

Let me not quote the poems now,
But only give their titles :
Their *face*, I'm very sure, will be
The index of their *vitals* !

"While glows my eye, my heart is dead."
That one came out on Monday ;
And though the tides of love had run
As high as those of Fundy,

In just a week they ebbed so fast
That when her second sonnet,
"*Lay not my hand in thine again*,"
Had praises heaped upon it,

Lorinda proved all suitors slack,
Her eyes they all were blind to ;
As to detention of her hand,
That no one seemed inclined to.

With sore regret and wonderment,
Lorinda now rehearses
Those telling lines she lately sang—
The key to love's reverses :

"O specious Fancy ! how you lie
For sake of being famous !
You've made my lovers think you fact,
And lost me even Amos !"

The maid wrote chiefly after this
Of battles, heroes, minsters,
Until the hour of thirty struck
Her name among the spinsters.

Now she begins of love again,
And sings alone from feeling ;
Those rhythmic edicts of her youth
That Fancy gave repealing.

So that her latest poems are,
— And critics say, much *stronger*,—
"*The heart, though dead, can live again*,"
And "*Clasp my hand yet longer* !"

No. 3.

FRENCH SCULPTORS. II.

IT is agreeable in many ways to turn from the rounded and complete impeccability of M. Dubois to the fancy of M. Saint-Marceaux. More than any of his rivals, M. Saint-Marceaux possesses the charm of unexpectedness. He is not perhaps to be called an original genius, and his work will probably leave French sculpture very nearly where it found it. Indeed one readily perceives that he is not free from the trammels of contemporary convention. But how easily he wears them, and if no "severe pains and birth-throes" accompany the evolution of his conceptions, how graceful these conceptions are! They are perhaps of the Canova family; the "Harlequin," for instance, which has had such a prodigious success, is essentially Milanese sculpture; essentially even the "Genius Guarding the Secret of the Tomb" is a fantastic rather than an original work. But how the manner, the treatment, triumphs over the Canova insipidity! It is not only Milanese sculpture better done, the execution beautifully sapient and truthful instead of cheaply imitative, the idea broadly enforced by the details instead of frittered away among them; it is Milanese sculpture essentially elevated and dignified. Loosely speaking, the mere *article de vertu* becomes a true work of art. And this transformation, or rather this development of a germ of not too great intrinsic importance, is brought about in the work of Saint-Marceaux by the presence of an element utterly foreign to the Canova sculpture and its succession — the element of character. If to the clever workmanship of the Italians he merely opposed workmanship

of a superior kind as well as quality — thoroughly artistic workmanship, that is to say — his sculpture would be far less interesting than it is. He does indeed noticeably do this; there is a felicity entirely delightful, almost magical, in every detail of his work. But when one compares it with the sculpture of M. Dubois, it is not of this that one thinks so much as of a certain individual character with which M. Saint-Marceaux always contrives to endue it. This is not always in its nature sculptural, it must be admitted, and it approaches perhaps too near the character of *genre* to have the enduring interest which purely sculptural qualities possess. But it is always individual, piquant, and charming, and in it consists M. Saint-Marceaux's claim upon us as an artist. No one else, even given his powers of workmanship, that is to say as perfectly equipped as he, could have treated so thoroughly conventional a *genre* subject as the "Harlequin" as he has treated it. The mask is certainly one of the stock properties of the subject, but notice how it is used to confer upon the whole work a character of mysterious witchery. It is as a whole, if you choose, an *article de Paris*, with the distinction of being seriously treated; the modeling and the movement admirable as far as they go, but well within the bounds of that anatomically artistic expression which is the *raison d'être* of sculpture and its choice of the human form as its material. But the character saves it from this category; what one may almost call its psychological interest redeems its superficial triviality. M. Saint-Marceaux is always successful in this way. One has only to look at the eyes of his figures to be convinced how subtle is his art of expressing character. Here he swings quite clear of all convention and manifests his genius positively and directly. The unfathomable secret of the tomb is in the spiritual expression

of the guarding genius, and the elaborately complex movement concentrated upon the urn and directly inspired by the Ephebes of the Sistine ceiling is a mere blind. The same is true of the portrait heads which within his range M. Saint-Marceaux does better than almost any one. M. Renan's "Confessions" hardly convey as distinct a notion of character as his bust exhibited at the Triennial. Several heads displayed at one of the exhibitions of the Société Internationale were hardly less remarkable. Long after the sharp edge of one's interest in the striking pose of his "Harlequin" and the fine movement and bizarre features of his "Genius" has worn away, their curious spiritual interest, the individual *cachet* of their character, will sustain them. And so integrally true is this of all the productions of M. Saint-Marceaux's talent, that it is quite as perceptible in works where it is not accentuated and emphasized as it is in those of which we have been speaking; it is a quality that will bear refining, that is even better indeed in its more subtle manifestations. The figure of the Luxembourg gallery, the young Dante reading Virgil, is an example; a girl's head, the forehead swathed in a turban, of the Société Internationale's Exhibition just referred to, is another. The charm of these is more penetrating, though they are by no means either as popular or as "important" works as the "Genius of the Tomb" or the "Harlequin." In the time to come M. Saint-Marceaux will probably rely more and more on their quality of grave and yet alert distinction, and less on striking and eccentric variations of themes from Michael Angelo like the "Genius," and illustrations like the "Harlequin" of the artistic potentialities of the Canova sculpture.

With considerably less force than M. Dubois and decidedly less piquancy than M. Saint-Marceaux, M. Antonin Mercié has perhaps greater refinement than either. His outline is a trifle softer, his sentiment more gracious, more suave. His work is difficult to characterize satisfactorily, and the fact may of course proceed from its lack of force, as well as from the well-understood difficulty of translating into epithets anything so essentially elusive as suavity and grace of form. At one epoch in any examination of contemporary French sculpture that of M. Mercié seems the most interesting; it is so free from exaggeration of any kind on the one hand, it realizes its idea so satisfactorily on the other, and this idea is so agreeable, so refined, and at the same time so dignified. The "David" here engraved is an early work now in the Luxembourg gallery, and the reader may judge how well it justifies these remarks. Being an early

work, one cannot perhaps insist on its originality; in France a young sculptor must be original at his peril; his education is so complete, he must have known and studied the beauties of classic sculpture so thoroughly, that not to be impressed by them so profoundly as to display his appreciativeness in his first work is apt to argue a certain insensitiveness. And every one cannot have creative genius. What a number of admirable works we should be compelled to forego if creative genius were demanded of an artist of the present day when the best minds of the time are occupied with other things than art! One is apt to forget that in our day the minds that correspond with the artistic miracles of the Renaissance are absorbed in quite different departments of effort. M. Mercié's "David" would perhaps never have existed but for Donatello's. As far as plastic motive is concerned, it may without injustice be called a variant of that admirable creation, and from every point of view except that of dramatic grace it is markedly inferior to its inspiration; as an embodiment of triumphant youth, of the divine ease with which mere force is overcome, it has only a superficial resemblance to the original. But if with M. Mercié "David" was simply a classic theme to be treated, which is exactly what it of course was not with Donatello, it is undeniable that he has expressed himself very distinctly in his treatment. A less sensitive artist would have vulgarized instead of merely varying the conception, whereas one can easily see in M. Mercié's handling of it the ease, science, and felicitous movement which have since expressed themselves more markedly, more positively, but hardly more unmistakably, in the sculptor's maturer works. Of these the chief is perhaps the "Gloria Victis," which now decorates the Square Montholon; and its identity of authorship with the "David" is apparent in spite of its structural complexity and its far greater importance both in subject and execution. Its subject is the most inspiring that a French sculptor since the events of 1870-71 (so lightly considered by those who only see the theatric side of French character) could treat. Its general interest, too, is hardly inferior; there is something generally ennobling in the celebration of the virtues of the brave defeated which surpasses the commonplace of pæans. M. Mercié was, in this sense, more fortunate than the sculptor to whom the Berliners owe the bronze commemoration of their victory. Perhaps to call his treatment entirely worthy of the theme, is to forget the import of such works as the tombs of the Medici Chapel at Florence. There is a region into whose precincts the dramatic quality penetrates only to play

ENGRAVED BY J. H. E. WHITNEY, AFTER THE STATUE BY SAINT-MARCEAUX.

HARLEQUIN.

an insufficient part. But in modern art to do more than merely to keep such truths in mind, to insist on satisfactory plastic illustrations of them, is not only to prepare disappointment for one's self, but to risk misjudging admirable and elevated effort; and to regret the fact that France had only M. Mercié and not Michael Angelo to celebrate her "*Gloria Victis*" is to commit both of these errors. After all, the subjects are different, and the events of 1870-71 had compensations for France which the downfall of Florentine liberty was without; so that, indeed, a note of unmixed melancholy, however lofty its strain, would have been a discord which M. Mercié has certainly avoided. He has avoided it in rather a marked way, it is true. His monument is rather dramatic and stirring than inwardly moving. It is rhetorical rather than truly poetic; and the admirable quality of its rhetoric, its complete freedom from vulgar or sentimental alloy,—its immense superiority to Anglo-Saxon rhetoric, in fine,—does not conceal the truth that it is rhetoric, that it is prose and not poetry after all. Mercié's "*Gloria Victis*" is very fine; I know nothing so fine in modern sculpture outside of France. But then there is not very much that is fine at all in modern sculpture outside of France; and modern French sculpture, and M. Mercié along with it as one of its most eminent ornaments, have made it impossible to speak of them in a relative way. The antique and the Renaissance sculpture alone furnish their fit association, and like the Renaissance and the antique sculpture they demand a positive and absolute, and not a comparative criticism.

Well, then, speaking thus absolutely and positively, the cardinal defect of French sculpture—and the refined and distinguished work of M. Mercié better perhaps than almost any other assists us to see this—is its over-carefulness for style. This is indeed the explanation of what I mentioned at the outset as the chief characteristic of this sculpture, the academic inelasticity, namely, with which it essays to reproduce the Renaissance romanticism. But for the fondness for style integral to the French mind and character, it would perceive the contradiction between this romanticism and any canons except such as are purely intuitive and indefinable. "Style," says Buffon (speaking of literary style, to be sure, but his definition is equally applicable to style in general), "style is nothing other than the order and movement which we put into our thoughts." In comparison with the Renaissance sculptors, the French sculptors of the present day are certainly too exclusive devotees of this order and movement, and too little occupied with the thought itself—too little in-

dividual. In comparison with the antique, this is less apparent, but I fancy not less real. We are so accustomed to think of the antique as the pure and simple embodiment of style, as a sublimation, so to speak, of the individual into style itself, that in this respect we are scarcely fair judges of the antique. In any case we know very little of it; we can hardly speak of it except by periods. But it is plain that the Greek is so superior to any subsequent sculpture in this one respect of style, that we rarely think of its other qualities. Our judgment is inevitably a comparative one, and inevitably a comparative judgment fixes our attention on the Greek supremacy of style. Indeed, in looking at the antique the thought itself is often alien to us, and the order and movement, being more nearly universal perhaps, are all that occupy us. A family tombstone lying in the cemetery at Athens, and half buried in the dust which blows from the Piræus roadway, has more style than M. Mercié's "*Quand-Même*" group for Belfort, which has been the subject of innumerable encomiums, and which has only style and no individuality whatever to commend it. And the Athenian tombstone was probably furnished to order by the marble-cutting artist of the period, corresponding to those whose signs one sees at the entrances of our own large cemeteries. Still we may be sure that the ordinary Athenian citizen who adjudged prizes between Æschylus and Sophocles, and to whom Pericles addressed the oration which only exceptional culture nowadays thoroughly appreciates, found plenty of individuality in the decoration of the Parthenon, and was perfectly conscious of the difference between Phidias and his pupils. Even now, if one takes the pains to think of it, the difference between such works as the so-called "*Genius*" of the Vatican and the Athenian marbles, or between the Niobe group at Florence and the Venus torso at Naples, for example, seems markedly individual enough, though the element of style is still to our eyes the most prominent quality in each. Indeed, if one really reflects upon the subject, it will not seem exaggeration to say that to any one who has studied both with any thoroughness it would be more difficult to individualize the mass of modern French sculpture than even that of the best Greek epoch—the epoch when style was most perfect, when its reign was, as it sometimes appears to us, most absolute. And if we consider the Renaissance sculpture, its complexity is so great, its individuality is so pronounced, that one is apt to lose sight of the important part which style really plays in it. In a work by Donatello we see first of all his thought; in a Madonna of Mino's it is the idea

A. MERCIÉ.

DAVID.

ENGRAVED BY H. WOLF.

which charms us; the Della Robbia frieze at Pistoja is pure *genre*. But modern French sculpture feels the weight of De Musset's handicap — it is born too late into a world too old. French art in general feels this, I think, and painting suffers from it equally with sculpture. Culture, the Institute, oppress individuality. But whereas Corot and Millet have triumphed over the Institute, there are hardly any Millets and Corots of sculpture whose triumph is as yet assured. The tendency, the weight of authority, the verdict of criticism, always conservative in France, are all the other way. At the École des Beaux-Arts one learns, negatively, not to be ridiculous. That is a great deal; it is more than can be learned anywhere else nowadays — witness German, Italian, above all English exhibitions. Positively one learns the importance of style; and if it were not for modern French sculpture, one would say that this was something the importance of which could not be exaggerated. But in modern French sculpture it is exaggerated, and, what is fatal, one learns to exaggerate it in the schools. The traditions of Houdon are noticeably forgotten. Not that Houdon's art is not eminently characterized by style; the "San Bruno" at Rome is in point of style an antique. But compare his "Voltaire" in the foyer of the Comédie Française with M. Chapu's "Berryer" of the Palais de Justice, to take one of the very finest portrait-statues of the present day. M. Chapu's statue is more than irreproachable, it is elevated and noble, it is in the grand style; but it is plain that its impressiveness is due to the fact that the subject is conceived as the Orator in general and handled with almost a single eye to style. The personal interest which accentuates every detail of the "Voltaire" — the physiognomy, the pose, the right hand, are marvelously characteristic — simply is not sought for in M. Chapu's work. Of this quality there is more in Houdon's bust of Molière, whom of course Houdon never saw and of whom no undisputed portrait exists, I believe, than in almost any production of the modern school. M. Chapu's works, and such exceptions as the heads of Baudry and Renan already mentioned, apart, one perceives that the modern school has made too many statues of the République, too many "Ledas" and "Susannahs" and "Quand-Mêmes" and "Gloria Victis." And its penchant for Renaissance canons only emphasizes the absolute commonplace of many of these.

On the other hand, if Houdon's felicitous harmony of style and individual force are forgotten, there is hardly any recognized succession to the imaginative freedom, the *verve*, the triumphant personal fertility of Rude and

Carpeaux. At least, such as there is has not preserved the dignity and in many instances scarcely the decorum of those splendid artists. Much of the sculpture which figures at the yearly Salons is, to be sure, the absolute negation of style; its main characteristic is indeed eccentricity; its main virtues, sincerity (which in art, of course, is only a very elementary virtue) and good modeling (which in sculpture is equally elementary). Occasionally in the midst of this display of fantasticality there is a work of promise or even of positive interest. The observer who has not a weak side for the graceful conceits, invariably daintily presented and beautifully modeled, of M. Moreau-Vauthier for example, must be hard to please; they are of the very essence of the *article de Paris*, and only abnormal primness can refuse to recognize the truth that the *article de Paris* has its art side. M. Moreau-Vauthier is not perhaps a modern Cellini; he has certainly never produced anything that could be classed with the "Perseus" of the Loggia de' Lanzi, or even with the Fontainebleau "Diana"; but he does more than any one else to keep alive the tradition of Florentine preciousness, and about everything he does there is something delightful.

Still the fantastic has not made much headway in the Institute, and it is so foreign to the French genius, which never tolerates it after it has ceased to be novel, that it probably never will. It is a great tribute to French "catholicity of mind and largeness of temper" that Carpeaux's "La Danse" remains in its position on the façade of the Grand Opéra. French sentiment regarding it was doubtless accurately expressed by the fanatic who tried to ink it indelibly after it was first exposed. This vandal was right from his point of view — the point of view of style. Almost the one work of absolute spontaneity among the hundreds which without and within decorate M. Garnier's edifice, it is thus a distinct jar in the general harmony; it distinctly mars the "order and movement" of M. Garnier's thought, which is fundamentally opposed to spontaneity. But imagine the devotion to style of a *milieu* in which a person who would throw ink on a confessedly fine work of art is actuated by an impersonal dislike of incongruity! Dislike of the incongruous is almost a French passion, and, like all qualities, it has its defect, the defect of tolerating the conventional. It is through this tolerance, for example, that one of the freest of French critics of art, a true Voltairean, Stendhal, was led actually to find Guido's ideal of beauty higher than Raphael's, and to miss entirely the grandeur of Tintoretto. Critical opinion in France has not changed radically since Stendhal's day.

A. FALGUIÈRE.

ST. VINCENT DE PAUL.

ENGRAVED BY R. A. MULLER.

The French sculptor may draw his inspiration from the sources of originality itself, his audience will measure the result by conventions. It is this fact undoubtedly which is largely responsible for the over-carefulness for style already remarked. Hence the work of M. Aimée-Millet and of Professors Guillaume and Cavelier, and the fact that they are professors. Hence also the election of M. Falguière to succeed to the chair of the Beaux-Arts left vacant by the death of Jouffroy. All of these have done admirable work. Professor Guillaume's Gracchi group at the Luxembourg is alone enough to atone for a mass of productions of which the "Castalian Fount" of a recent Salon is the cold and correct representative. Cavelier's "Gluck," destined for the Opéra, is spirited even if a trifle galvanic. Millet's "Apollo," which crowns the main gable of the Opéra, stands out among its author's other works as a miracle of grace and rhythmic movement. M. Falguière's admirers, and they are numerous, will object to the association here made. Falguière's range has always been a wide one, and everything he has done has undoubtedly merited a portion of the prodigious encomiums it has invariably obtained. Yet, estimating it in any other way than by energy, variety and mass, it is impossible to praise it highly with precision. It is too plainly the work of an artist who can do one thing as well as another, and of which cleverness is, after all, the spiritual standard. Bartholdi, who also should not be forgotten in any sketch of French sculpture, would, I am sure, have acquitted himself more satisfactorily than Falguière has done in the colossal

groups of the Trocadéro and the Arc de l'Étoile. To acquit himself satisfactorily is Bartholdi's specialty. These two groups are the largest and most important that a sculptor can have to do. The crowning of the Arc de Triomphe at least was a splendid opportunity. Neither of them has any distinction of outline, of mass, of relation, or of idea. Both are conventional to the last degree. That on the Arc has even its ludicrous details, such as occur only from artistic absent-mindedness in a work conceived and executed in a fatigued and hackneyed spirit. The "Saint Vincent de Paul" of the Panthéon, which justly passes for the sculptor's *chef-d'œuvre*, is in idea a work of large humanity. M. Falguière is behind no one in ability to conceive a subject of this kind with propriety, and his subject here is inspiring if ever a subject was. The "Petit Martyr" of the Luxembourg has a real charm, but it too is content with too little, as one finds out in seeing it often; and it is in no sense a large work, scarcely larger than the tiresomely popular "Running Boy" of the same museum, which nevertheless in its day marked an epoch in modeling. Indeed, so slight is the spiritual hold that M. Falguière has on one, that it really seems as if he were at his best in such a frankly carnal production as his "Diana" of the Triennial Exposition. The idea is nothing or next to nothing, but the surface *faire* is superb, and if Professor Falguière can communicate the secret of such modeling to his pupils at the Beaux-Arts, no one will regret the choice of so skillful a sculptor to succeed Jouffroy over candidates of greater artistic force.

W. C. Brownell.

A. FALGUIÈRE.

THE LITTLE MARTYR.

COMETS AND METEORS.

THE NEW ASTRONOMY.

THE CAMP AT MT. WHITNEY. (FROM "PROFESSIONAL PAPERS OF THE SIGNAL SERVICE," VOL. XV.)

WHAT is truth? What is fact, and what is fancy, even with regard to solid visible things that we may see and handle?

Among the many superstitions of the early world, and credulous fancies of the middle ages, was the belief that great stones sometimes fell down out of heaven on to the earth.

Pliny has a story of such a black stone, big

enough to load a chariot; the Mussulman still adores one at Mecca; and a mediæval emperor of Germany had a sword which was said to have been forged from one of these bolts shot out of the blue. But, with the revival of learning, people came to know better! That stones should fall down from the sky was clearly, they thought, an absurdity; indeed, according to the learned opinion of that time, one would hardly ask a better instance of the difference between the realities which science recognized and the absurdities

VESUVIUS DURING AN ERUPTION.

which it condemned than the fancy that such a thing could be. So at least the matter looked to the philosophers of the last century, who treated it much as they might treat certain alleged mental phenomena, for instance, if they were alive to-day, and at first refused to take any notice of these stories, when from time to time they still came to hand. When induced to give the matter consideration, they observed that all the conditions for scientific observation were violated by these bodies, since the wonder always happened at some far-off place, or at some past time, and (suspicious circumstance!) the stones only fell in the presence of ignorant and unscientific witnesses, and never when scientific men were at hand to examine the facts. That there were many worthy, if igno-

rant, men who asserted that they had seen such stones fall, seen them with their very eyes, and held them in their own hands, was accounted for by the general love of the marvelous and by the ignorance of the common mind, unlearned in the conditions of scientific observation, and unguided by the great principle of the uniformity of the laws of nature. Such a tone, of course, cannot be heard among us who never hastily pronounce anything a departure from the laws of nature, while uncertain that these can be separated from the laws of the fallible human mind, in which alone nature is seen. But in the last century philosophers had not yet become humble, or scientific men diffident of the absoluteness of their own knowledge, and so it seemed that no amount of evidence was enough to

gain an impartial hearing in the face of the settled belief that the atmosphere extended only a few miles above the earth's surface, and that the region beyond, whence alone such things could come, was an absolute void extending to the nearest planet.

It used to be supposed that we were absolutely isolated, not only from the stars but from other planets, by vast empty spaces extending from world to world—regions altogether vacant except for some vagrant comet; but of late years we are growing to have new ideas on this subject, and not only to consider space as far from void or tenantless, but to admit, as a possibility at least, that there is a sort of continuity between our very earth's surface, the air above it, and all which lies beyond the blue overarching dome of our own sky. Our knowledge of the physical nature of the universe without has chiefly come from what the spectroscope, overleaping the space between us and the stars, has taught us of them; as a telegram might report to us the existence of a race across the ocean, without telling anything of what lay between. It would be a novel path to the stars, and to the intermediate regions whence these once mythical stones are now actually believed to come, if we could take the reader to them by a route which enabled us to note each step of a continuous journey from the earth's surface out into the unknown; but if we undertake to start upon it, he will understand that we must almost at the outset leave the ground of comparative certainty on which we have hitherto rested, and need to speak of things on this road which are still but probabilities, and even some which are little more than conjectures, before we get to the region of comparative certainty again, a region which, strange to say, exists far away from us, while that of doubt lies close at hand. For we may be said without exaggeration to know more about Sirius than about the atmosphere a thousand miles above the earth's surface; indeed, it would be more just to say that we are sure not only of the existence but of the elements that compose a star, though a million of times as far off as the sun, while at the near point named we are not sure of so much as that the atmosphere exists at all.

To begin our outward journey in a literal sense, we might rise from the earth's surface some miles in a balloon, when we should find our progress stayed by the rarity of the air. Below us would be a gray cloud-ocean, through which we could see here and there the green earth beneath, while above us there would still be something in the apparently empty air, for if the sun has just set it will still be *light* all round us. Something then, in a cloudless sky, still exists to reflect the rays towards us,

and this something is made up of separately invisible specks of dust and vapor, but very largely of actual dust, which probably forms the nucleus of each mist-particle. That discrete matter of some kind exists here has long been recognized from the phenomena of twilight; but it is, I think, only recently that we are coming to admit that a shell of actual solid particles in the form of dust probably incloses the whole globe, up to far above the highest clouds.

In 1881 the writer had occasion to conduct a scientific expedition to the highest point in the territories of the United States, on one of the summits of the Sierra Nevadas of southern California, which rise even above the Rocky Mountains.

The illustration on page 339 represents the camp occupied by this party below the summit, where the tents, which look as if in the bottom of a valley, are yet really above the highest zone of vegetation, and at an altitude of nearly twelve thousand feet.

Still above these rise the precipices of barren rock seen in the background, their very bases far above the highest visible dust-clouds, which overspread like a sea the deserts at the mountain's foot; precipices which when scaled lift the observer into what is, perhaps, the clearest and purest air to be found in the world. It will be seen from the mere looks of the landscape that we are far away here from ordinary sources of contamination in the atmosphere. Yet even above here on the highest peak, where we felt as if standing on the roof of the continent and elevated into the great aerial currents of the globe, the telescope showed particles of dust in the air, which the geologists deemed to have probably formed part of the soil of China and to have been borne across the Pacific, but which also, as we shall see later, may owe something to the mysterious source of the phenomena already alluded to.

It is far from being indifferent to us that the dust is there, for, to mention nothing else, without it, it would be night till the sunrise, and black night again as soon as the sun's edge disappeared below the horizon. The morning and the evening twilight, which in northern latitudes increase our average time of light by some hours and add very materially to the actual days of man's life, are probably due almost wholly to particle scarcely visible in the microscope, and to the presence of such atoms, smaller than the very motes ordinarily seen in the sunbeam, which, as Mr. Aitken has shown, fill the air we breathe; so minute and remote are the causes on which the habits of life depend.

Before we can see that a part of this impalpable, invisible dust is also perhaps a link between our world and other members of the

solar system, we must ask how it gets into the atmosphere. Is it blown up from the earth, or does it fall down out of the miscalled "void" of space?

If we cast a handful of dust into the air, it will not mount far above the hand unless we set the air in motion with it, as in ascending smoke-currents, and the greatest explosions we can artificially produce hurl their finer products but a few hundred feet at most from the soil. Utterly different are the forces of nature. We have on page 340 a reproduction from a photograph of an eruption of Vesuvius—a mere toy-volcano compared to Etna or Hecla. But observe the smoke-cloud which rises high in the sunshine, looking solid as the rounded snows of an Alp, while the cities and the sea below are in the shadow. The smoke that mounts from the foreground, where the burning lava-streams are pouring over the surface and firing the woods, is of another kind from that rolling high above. *This* comes from within the mountain, and is composed of clouds of steam mingled with myriads of dust-particles from the comminuted products of the earth's interior, and we can see ourselves that it is borne away on a level, miles high in the upper air.

But what is this to the eruption of Sumbawa or Krakatao? The latter occurred in 1883, and it will be remembered that the air-wave started by the explosion was felt around the globe, and that, probably owing to the dust and water-vapor blown into the atmosphere, the sunsets even in America became of that extraordinary crimson we all remember three years ago, and coincidentally, that dim, reddish halo made its appearance about the sun the world over, which is hardly yet gone. Very careful estimates of the amount of ashes ejected have been made; and though most of the heavier particles are known to have fallen into the sea within a few miles, a certain portion—the lightest—was probably carried by the explosion far above the lower strata of the atmosphere, to descend so slowly that some of it may still be there. Of this lighter class the most careful estimates must be vague, but according to the report of the official investigation by the Dutch government that which remained floating is something enormous. An idea of its amount may be gained by supposing these impalpable and invisible particles to condense again from the upper sky, and to pour down on the highest edifice in the world, the Washington Monument. If the dust were allowed to spread out on all sides, till the pyramidal slope was so flat as to be permanent, the capstone of the monument would not only be buried before the supply was exhausted, but buried as far

below the surface as that pinnacle is now above.

Of the explosive suddenness with which the mass was hurled, we can judge something (comparing small things with great) by the explosion of dynamite.

It happened once that the writer was standing by a car in which some railway porters were lifting boxes. At that moment came an almost indescribable sound, for it was literally stunning, though close and sharp as the crack of a whip in one's hand, and yet louder than the nearest thunder-clap. The men leaped from the car, thinking that one of the boxes had exploded between them; but the boxes were intact, and we saw what seemed a pillar of dust rising above the roof of the station, hundreds of yards away. When we hurried through the building, we found nothing on the other side but a bare plain, extending over a mile, and beyond this the actual scene of the explosion that had seemed to be at our feet. There had been there, a few minutes before, extensive buildings and shops belonging to the railroad, and sidings on which cars were standing, two of which, loaded with dynamite, had exploded.

Where they had been was a crater-like depression in the earth, some rods in diameter; the nearest buildings, great solid structures of brick and stone, had vanished, and the more distant wooden ones and the remoter lines of freight-cars on the side-tracks presented a curious sight, for they were not shattered so much as bent and leaning every way, as though they had been built of pasteboard, like card-houses, and had half yielded to some gigantic puff of breath. All that the explosion had shot skyward had settled to earth or blown away before we got in sight of the scene, which was just as quiet as it had been a minute before. It was like one of the changes of a dream.

Now it is of some concern to us to know that the earth holds within itself similar forces, on an incomparably greater scale. For instance, the explosion which occurred at Krakatao, at five minutes past ten, on the 27th of August, 1883, according to official evidence, was heard at a distance of 1800 miles, and the puff of its air-wave injured dwellings two hundred miles distant, and, we repeat, carried into the highest regions of the atmosphere and around the world matter which it is at least possible still affects the aspect of the sun today from New York or Chicago.

Do not the great flames which we have seen shot out from the sun at the rate of hundreds of miles a second, the immense and sudden perturbations in the atmosphere of Jupiter, and the scarred surface of the moon, seem to

be evidences of analogous phenomena, common to the whole solar system, not wholly unconnected with those of earthquakes, and which we can still study in the active volcanoes of the earth?

If the explosion of gunpowder can hurl a cannon-shot three or four miles into the air, how far might the explosion of Krakatao cast its fragments? At first we might think there must be some proportionality between the volume of the explosion and the distance, but this is not necessarily so. Apart from the resistance of the air, it is a question of the velocity with which the thing is shot upward, rather than the size of the gun, or the size of the thing itself, and with a sufficient velocity the projectile would never fall back again. "What goes up must come down" is, like most popular maxims, true only within the limits of ordinary experience; and even were there nothing else in the universe to attract it, and though the earth's attraction extend to infinity, so that the body would never escape from it, it is yet quite certain that it would, with a certain initial velocity (very moderate in comparison with that of the planet itself), go up and *never* come back; while under other and possible conditions it might voyage out into space on a comet-like orbit, and be brought back to the earth, perhaps in after ages, when the original explosion had passed out of memory or tradition. But because all this is possible, it does not follow that it is necessarily true; and if the reader ask why he should then be invited to consider such suppositions at all, we repeat that in our journey outward, before we come to the stars, of which we know something, we pass through a region of which we know almost nothing; and this region, which is peopled by the subjects of conjecture, is the scene, if not the source, of the marvel of the falling stones, concerning which the last century was so incredulous, but for which we can, aided by what has just been said, now see at least a possible cause, and to which we now return.

Stories of falling stones, then, kept arising from time to time during the last century as they had always done, and philosophers kept on disbelieving them as they had always done, till an event occurred which suddenly changed scientific opinion to compulsory belief.

On the 26th of April, 1803, there fell, not in some far-off part of the world, but in France, not one alone, but many thousand stones, over an area of some miles, accompanied with noises like the discharge of artillery. A committee of scientific men visited the spot on the part of the French Institute, and brought back, not only the testimony of scores of witnesses or auditors, but the stones them-

selves. Soon after stones fell in Connecticut, and here and elsewhere, as soon as men were prepared to believe, they found evidence multiplied; and such falls, it is now admitted, though rare in any single district, are of what may be called frequent occurrence as regards the world at large; for, taking land and sea together, the annual stone-falls are probably to be counted by hundreds.

It was early noticed that these stones consisted either of a peculiar alloy of iron, or of minerals of volcanic origin, or both, and the first hypothesis was that they had just been shot out from terrestrial volcanoes. As they were, however, found, as in the case of the Connecticut meteorite, thousands of miles from any active volcanoes, and were seen to fall, not vertically down, but as if shot horizontally overhead, this view was abandoned. Next the idea was suggested that they were coming from volcanoes in the moon; and though this had little to recommend it, it was adopted in default of a better, and entertained down to a comparatively very recent period. These stones are now collected in museums, where any one may see them, and are to be had of the dealers in such articles by any who wish to buy them. They are coming to have such a considerable money value that, in one case at least, a lawsuit has been instituted for their possession between the finder, who had picked the stones up on ground leased to him, and claimed them under the tenant's right to wild game, and his landlord, who thought they were his as part of the real estate.

Leaving the decision of this novel law-point to the lawyers, let us notice some facts now well established.

The fall is usually preceded by a thundering sound, sometimes followed or accompanied by a peculiar sound described as like that of a flock of ducks rising from the water. The principal sound is often, however, far louder than any thunder, and sometimes of stunning violence. At night this is accompanied by a blaze of lightning-like suddenness and whiteness, and the stones commonly do not fall vertically, but as if shot from a cannon at long range. They are usually burning hot, but, in at least one authenticated instance, one was so intensely cold that it could not be handled. They are of all sizes, from tons to ounces, comparatively few, however, exceeding a hundred-weight, and they are oftenest of a rounded form, or looking like pieces of what was originally round, and usually wholly or partly covered with a glaze formed of the fused substance itself. If we slowly heat a lump of loaf sugar all through, it will form a pasty mass, while we may also hold it without inconvenience in our fingers to the gas-flame a few sec-

onds, when it will be melted only on the side next the sudden heat, and rounded by the melting. The sharp contrast of the melted and the rough side is something like that of the meteorites; and just as the sugar does not burn the hand, though close to where it is brought suddenly to a melting heat, a mass of ironstone may be suddenly heated on the surface, while it remains cold on the inside. But, however it got there, the stone undoubtedly comes from the intensely cold spaces above the upper air; and what is the source of such a heat that it is melted in the cold air, and in a few seconds?

Everybody has noticed that if we move a fan gently, the air parts before it with little effort, while, when we try to fan violently, the same air is felt to react; yet if we go on to say that if the motion is still more violent the atmosphere will resist like a solid, against which the fan, if made of iron, would break in pieces, this may seem to some an unexpected property of the "nimble" air through which we move daily. Yet this is the case, and if the motion is only so quick that the air cannot get out of the way, a body hurled against it will rise in temperature like a shot striking an armor-plate. It is all a question of speed, and that of the meteorite is known to be immense. One has been seen to fly over this country from the Mississippi to the Atlantic in an inappreciably short time, probably in less than two minutes; and though at a presumable height of over fifty miles, the velocity with which it shot by gave every one the impression that it went just above his head, and some witnesses of the unexpected apparition looked the next day to see if it had struck their chimneys. The heat developed by arrested motion in the case of a mass of iron moving twenty miles a second can be calculated, and is found to be much more than enough, not only to melt it, but to turn it into vapor; though what probably does happen is, according to Professor Newton, that the melted surface-portions are wiped away by the pressure of the air and volatilized to form the luminous train, the interior remaining cold, until the difference of temperature causes a fracture, when the stone breaks and pieces fall—some of them at red-hot heat, some of them possibly at the temperature of outer space, or far below that of freezing mercury.

Where do these stones come from? What made them? The answer is not yet complete, but if a part of the riddle is already yielding to patience, it is worthy of note, as an instance of the connection of the sciences, that the first help to the solution of this astronomical enigma came from the chemists and the geologists.

The earliest step in the study, which has

now been going on for many years, was to analyze the meteorite, and the first result was that it contained no elements not found on this planet. The next was that, though none of these elements were unknown, they were not combined as we see them in the minerals we dig from the earth. Next it was found that the combinations, if unfamiliar at the earth's surface and nowhere reproduced exactly, were at least very like such as existed down beneath it, in lower strata, as far as we can judge by specimens of the earth's interior cast up from volcanoes. Later, a resemblance was recognized in the elements of the meteorites to those found by the spectroscope in shooting stars, though the spectroscopic observation of the latter is too difficult to have even yet proceeded very far. And now, within the last few years, we seem to be coming near to a surprising solution.

It has now been shown that meteoric stones sometimes contain pieces of essentially different rocks fused together, and pieces of detritus—the wearing down of older rocks. Thus, as we know that sandstone is made of compacted sand, and sand itself was in some still earlier time part of rocks worn down by friction—when it is shown, as it has been by M. Meunier, that a sandstone with threads of copper in it (like some of our Lake Superior formations) has come to us in a meteorite, his conclusion that these stones may be part of some old world is one that, however startling, we cannot refuse at least to consider. According to this view, there may have been a considerable planet near the earth, which, having reached the last stage of planetary existence shown in the case of our present moon, went one step further—went, that is, out of existence altogether, by literal breaking up and final disappearance. We have seen the actual moon scarred and torn in every direction, and are asked to admit the possibility that a continuance of the process on a similar body has broken it up into the fragments that come to us. We do not say that this is the case, but that (as regards the origin of some of the meteorites at least) we cannot at present disprove it. We may at any rate present to the novelist seeking a new *motif* that of a meteorite bringing to us the story of a lost race, in some fragment of art or architecture of its lost world.

We are not driven to this world-shattering hypothesis by the absence of others, for we may admit these to be fragments of a larger body without necessarily concluding that it was a world like ours, or, even if it were, that the world which sent them to us is destroyed. In view of what we have been learning of the tremendous explosive forces we see in action on the sun and probably on other planets, and

even in terrestrial volcanoes to-day, it is certainly conceivable that some of these stones may have been ejected by some such process from any sun, or star, or world we see. The reader is already prepared for the suggestion that part of them may be the product of terrestrial volcanoes in early epochs, when our planet was yet glowing sunlike with its proper heat, and the forces of nature were more active; and that these errant children of mother earth's youth, after circulating in lengthened orbits, are coming back to her in her age.

Do not let us, however, forget that these are mostly speculations only, and perhaps the part of wisdom is not to speculate at all till we learn more facts; but are not the facts themselves as extraordinary as any invention of fancy?

Although it is true that the existence of the connection between shooting stars and meteorites lacks some links in the chain of proof, we may very safely consider them together; and if we wish to know what the New Astronomy has done for us in this field, we should take up some treatise on astronomy of the last century. We turn in one to the subject of falling stars, and find that "This species of Star is only a light Exhalation, almost wholly sulphurous, which is inflamed in the free Air much after the same manner as Thunder in a Cloud by the blowing of the Winds." That the present opinion is different we shall shortly notice.

All of us have seen shooting stars, and they are indeed something probably as old as this world, and have left their record in mythology as well as in history. According to Moslem tradition, the evil genii are accustomed to fly at night up to the confines of heaven in order to overhear the conversation of the angels, and the shooting stars are the fiery arrows hurled by the latter at their lurking foes, with so good an aim that we are told that for every falling star we may be sure that there is one spirit of evil the less in the world. The scientific view of them, however, if not so consolatory, is perhaps more instructive, and we shall here give most attention to the latter.

To begin with, there have been observed in history certain times when shooting stars were unusually numerous. The night when King Ibrahim Ben Ahmed died, in October, 902, was noted by the Arabians as remarkable in this way, and it has frequently been observed since that, though we can always see some of these meteors nightly, there are at intervals very special displays of them. The most notable modern one was on November 13th, 1833, and this was visible over much of the North American continent, forming a spectacle of terrifying grandeur.

An eye-witness in South Carolina wrote:

"I was suddenly awakened by the most distressing cries that ever fell on my ears. Shrieks of horror and cries for mercy I could hear from most of the negroes of the three plantations, amounting in all to about 600 or 800. While earnestly listening for the cause I heard a faint voice near the door, calling my name. I arose, and, taking my sword, stood at the door. At this moment I heard the same voice still beseeching me to rise, and saying, 'O my God, the world is on fire!' I then opened the door, and it is difficult to say which excited me the most—the awfulness of the scene, or the distressed cries of the negroes. Upwards of one hundred lay prostrate on the ground—some speechless and some with the bitterest cries, but with their hands raised, imploring God to save the world and them. The scene was truly awful; for never did rain fall much thicker than the meteors fell towards the earth; east, west, north, and south, it was the same."

The illustration on page 349 does not exaggerate the number of the fiery flashes at such a time, though the zigzag course which is observed in some is hardly so common as it here appears.

When it was noted that the same date, November 13th, had been distinguished by star-showers in 1831 and 1832, and that the great shower observed by Humboldt in 1799 was on this day, the phenomenon was traced back and found to present itself about every thirty-three years, the tendency being to a little delay on each return; so that Professor Newton and others have found it possible with this clue to discover in early Arabic and other mediæval chronicles and in later writers descriptions which, fitted together, make a tolerably continuous record of this thirty-three-year shower, beginning with that of King Ibrahim already alluded to. The shower appeared again in November, 1867 and 1868, with less display, but with sufficient brilliance to make the writer well remember the watch through the night, and the count of the flying stars, his most lively recollection being of their occasional colors, which in exceptional cases ranged from full crimson to a vivid green. The count on this night was very great, but the number which enter the earth's atmosphere even ordinarily is most surprising; for, though any single observer may note only a few in his own horizon, yet, taking the world over, at least ten millions appear every night, and on these special occasions very many more. This November shower comes always from a particular quarter of the sky, that occupied by the constellation Leo, but there are others, such as that of August 10th (which is annual), in which the "stars" seem to be shot

at us from the constellation Perseus: and each of the numerous groups of star-showers is now known by the name of the constellation whence it seems to come, so that we have *Perseids* on August 10th, *Geminids* on December 12th, *Lyrids* April 20th, and so on.

The great November shower, which is coming once more in this century, and which every reader may hope to see towards 1899, is of particular interest to us as the first whose movements were subjected to analysis, for it has been shown by the labors of Professor Newton, of Yale, and Adams, of Cambridge, that these shooting stars are bodies moving around the sun in an orbit which is completed in about thirty-three years. It is quite certain, too, that they are not exhalations from the earth's atmosphere, but little solids, invisible till they shine out by the light produced by their own fusion. Each, then, moves on its own track, but the general direction of all the tracks concurs; and though some of them may conceivably be solidified gases, we should think of them not as gaseous in form, but as solid shot, of the average size of something like a cherry, or perhaps even of a cherry-stone, yet each an independent planetoid, flying with a hundred times the speed of a rifle-bullet on its separate way as far out as the orbit of Uranus; coming back three times in a century to about the earth's distance from the sun, and repeating this march forever, unless it happen to strike the atmosphere of the earth itself, when there comes a sudden flash of fire from the contact, and the distinct existence of the little body, which may have lasted for hundreds of thousands of years, is ended in a second.

If the reader will admit so rough a simile, we may compare such a flight of these bodies to a thin swarm of swift-flying birds — thin, but yet immensely long, so as to be, in spite of the rapid motion, several years in passing a given point, and whose line of flight is cut across by us on the 13th of November, when the earth passes through it. We are only there on that day, and can only see it then; but the swarm is years in all getting by, and so we may pass into successive portions of it on the anniversary of the same day for years to come. The stars appear to shoot from Leo, only because that constellation is in the line of their flight when we look up to it, just as an interminable train of parallel flying birds would appear to come from some definite point on the horizon.

We can often see the flashes of meteors at over a hundred miles, and though at times they may seem to come thick as flakes of falling snow, it is probable, according to Professor Newton, that even in a "shower" each tiny

planetoid is more than ten miles from its nearest neighbor, while on the average it is reckoned that we may consider that each little body, though possibly no larger than a pea, is over two hundred miles from its neighbor, or that to each such grain there is nearly 10,000,000 cubic miles of void space. Their velocity as compounded with that of the earth is enormous, sometimes forty to fifty miles per second (according to a recent but unproved theory of Mr. Denning's, it would be much greater), and it is this enormous rate of progress that affords the semblance of an abundant fall of rain, notwithstanding the distance at which one drop follows another. It is only from their light that we are able to form a rough estimate of their average size, which is, as we have seen, extremely small, but, from their great number, the total weight they add to the earth daily may possibly be a hundred tons, probably not very much more. As they are as a rule entirely dissipated in the upper air, often at a height of from fifty to seventy miles, it follows that many tons of the finest pulverized and gaseous matter are shot into the earth's atmosphere every twenty-four hours from outer space, so that here is an independent and constant supply of dust, which we may expect to find coming down from far above the highest clouds.

Now, when the reader sees the flash of a shooting star, he may, if he please, think of the way the imagination of the East accounts for it, or he may look at what science has given him instead. In the latter case he will know that a light which flashed and faded almost together came from some strange little entity which had been traversing cold and vacant space for untold years, to perish in a moment of more than fiery heat; an enigma whose whole secret is unknown, but of which, during that instant flash, the spectroscope caught a part, and found evidence of the identity of some of its constituents with those of the observer's own body.

Of comets, the Old Astronomy knew that they came to the sun from great distances in all directions, and in calculable orbits; but as to *what* they were, this, even in the childhood of those of us who are middle-aged, was as little known as to the centuries during which they still from their horrid heads shook pestilence and war. We do not know even now by any means exactly what they are, for enough yet remains to be learned about them still to give their whole study the attraction which belongs to the unknown; and yet we learn so much, and in a way which to our grandfathers would have been so unexpected, connecting together the comet, the shooting star, and the meteorite, that the astronomer who

perhaps speaks with most authority about these to-day was able not long ago, in beginning a lecture, to state that he held in his hand what had been a part of a comet; and what he held was, not something half vaporous or gaseous, as we might suppose from our old associations, but a curious stone like this on page 350, which, with others, had fallen from the sky in Iowa, a flashing prodigy, to the terror of barking dogs, shying horses, and fearful men, followed by clouds of smoke and vapor, and explosions that shook the houses like an earthquake, and "hollow bellowings and rattling sounds, mingled with clang and clash and roar," as an auditor described it. It is only a fragment of a larger stone which may have weighed tons. It looks inoffensive enough now, and its appearance affords no hint of the commotion it caused in a peaceable neighborhood only ten years ago. But what, it may be asked, is the connection between such things and comets?

To answer this, let us recall the statement that the orbit of the November meteor swarm has been computed, which means that those flying bodies have been found to come only from one particular quarter out of all possible quarters, at one particular angle out of all possible angles, at one particular velocity out of all possible velocities, and so on, so that the chances are endless against mere accident's producing another body which agreed in all these particulars, and others beside. Now, in 1867 the remarkable fact was established that a comet seen in the previous year (Comet 1, 1866) had the same orbit as the meteoroids, which implies, as we have just seen, that the comet and the meteors were in some way closely related.

The paths of the August meteors and of the Lyrids also have both been found to agree closely with those of known comets, and there is other evidence which not only connects the comets and the shooting stars, and makes it probable that the latter are due to some disintegration of the former, but even looks as though the process were still going on. And now with this in mind we may, perhaps, look at these drawings with more interest.

We have all seen a comet, and we have all felt, perhaps, something of the awe which is called up by the thought of its immensity and its rush through space like a runaway star. Its head is commonly like a small luminous point, from which usually grows as it approaches the sun a relatively enormous brush or tail of pale light, which has sometimes been seen to stretch across the whole sky from zenith to horizon. It is useless to look only along the ecliptic road for a comet's coming; rather may we expect to see it

rushing down from above, or up from below, sometimes with a speed which is possibly greater than it could get from any fall — not so much, that is, the speed of a body merely dropping towards the sun by its weight, as that of a missile hurled into the orderly solar system from some unknown source without, and also associated with some unknown power; for while it is doubtful whether gravity is sufficient to account for the velocity of all comets, it seems certain that gravity can in no way explain some of the phenomena of their tails.

Thousands of comets have been seen since the Christian era, and the orbits of hundreds have been calculated since the time of Newton. Though they may describe any conic section, and though most orbits are spoken of as parabolas, this is rather a device for the analyst's convenience than the exact representation of fact. Without introducing more technical language, it will be enough to say here that we learn in other cases from the form of the orbit whether the body is drawn essentially by the sun's gravity, or whether it has been thrown into the system by some power beyond the sun's control, to pass away again, out of that control, never to return. It must be admitted, however, that though several orbits are so classed, there is not any one known to be beyond doubt of this latter kind, while we are certain that many comets, if not all, are erratic members of the solar family, coming back again after their excursions, at regular, though perhaps enormous, intervals.

But what we have just been saying belongs rather to the province of the Old Astronomy than the New, which concerns itself more with the nature and appearance of the heavenly bodies than the paths they travel on. Perhaps the best way for us to look at comets will be to confine our attention at first to some single one, and to follow it from its earliest appearance to its last, by the aid of pictures, and thus to study, as it were, the species in the individual. The difficulty will be one which arises from the exquisitely faint and diaphanous appearance of the original, which no ordinary care can possibly render, though here the reader has had done for him all that the wood-engraver can do.

We will take as the subject of our illustration the beautiful comet which those of us who are middle-aged can remember seeing in 1858, and which is called Donati's from the name of its discoverer. We choose this one because it is the subject of an admirable monograph by Professor Bond of the Harvard College Observatory, from which our engravings have, by permission, been made.

Let us take the history of this comet, then, as a general type of others; and to begin at

the beginning, we must make the very essential admission that the origin of the comet's life is unknown to us. Where it was born or how it was launched on its eccentric path we can only guess, but do not know, and how long it has been traversing it we can only tell later. On the second of June, 1858, this one was discovered in the way most comets are found, that is, by a comet-hunter, who detected it as a telescopic speck long before it became visible to the naked eye, or put forth the tail which was destined to grow into the beautiful object many of us can remember seeing. For over a century now there has been probably no year in which the heavens have not been thus searched by a class of observers who make comet-hunting a specialty.

The father of this very valuable class of observers appears to have been Messier, a Frenchman of the last century and of the purest type of the comet-hunters, endowed by nature with the instinct for their search that a terrier has for rats. In that grave book, Delambre's "History of Astronomy," as we plod along its dry statements and through its long equations, we find, unexpected as a joke in a table of logarithms, the following piece of human nature (quoted from Messier's contemporary, La Harpe):

"He [Messier] has passed his life in nosing out the tracks of comets. He is a very worthy man, with the simplicity of a baby. Some years ago he lost his wife, and his attention to her prevented him from discovering a comet he was on the search for, and which Montaigne of Limoges got away from him. He was in despair. When he was condoled with on the loss he had met, he replied, with his head full of the comet, 'Oh, dear! To think that when I had discovered twelve, this Montaigne should have got my thirteenth,' and his eyes filled with tears, till, remembering what it was he ought to be weeping for, he moaned, 'Oh, my poor wife!' but went on crying for his comet."

Messier's scientific posterity has greatly multiplied, and it is rare now for a comet to be seen by the naked eye before it has been caught by the telescope of one of these assiduous searchers. Donati had, as we see, observed his some months before it became generally visible, and accordingly the engraving on page 350 shows it as it appeared on the evening of September 16th, 1858, when the tail was already formed, and, though small, was distinct to the naked eye, near the stars of the Great Bear. The reader will easily recognize in the plate the familiar "dipper," as the American child calls it, where the leading stars are put down with care, so that he may, if he please, identify them by comparison with the originals in the sky, even to the little companion to Mizar (the second in the handle of the "dipper," and which the Arabs say is the lost Pleiad). We would suggest that

he should note both the length of the tail on this evening as compared with the space between any two stars of the "dipper" (for instance, the two right-hand ones called the "pointers") and its distance from them, and then turn to page 352, where we have the same comet as seen a little over a fortnight later, on October 3d. Look first at its new place among the stars. The "dipper" is still in view, but the comet has drifted away from it toward the left and into other constellations. The large star close to the left margin of the plate, with three little stars below and to the right, is Arcturus; and the western stars of the Northern Crown are just seen higher up. Fortunately the "pointers" with which we compared the comet on September 16th are still here, and we can see for ourselves how it has not only shifted but grown. The tail is three times as long as before. It is rimmed with light on its upper edge, and fades away so gradually below that one can hardly say where it ends. But,—wonderful and incomprehensible feature!—shot out from the head, almost as straight as a ray of light itself, but fainter than the moonbeam, now appears an extraordinary addition, a sort of spur, which we can hardly call a new tail, it is so unlike the old one, but which appears to have been darted out into space as if by some mysterious force acting through the head itself. What the spur is, what the tail is, even what the nucleus is, we cannot be said really to know even to-day; but of the tail and of the nucleus or speck in the very head of the comet (too small to be visible in the engraving), we may say that the hairy tail (*comes*) gives the comet its name, and *is* the comet to popular apprehension, but that it is probably the smallest part of the whole mass, while the little shining head, which to the telescope presents a still smaller speck called the nucleus, contains, it now seems probable, the only element of possible danger to the earth.

While admitting our lack of absolute knowledge, we may, if we agree that meteorites were once part of a comet, say that it now seems probable that the nucleus is a hard, stone-like mass, or collection of such masses, which comes from "space" (*i. e.*, from we don't know how far) to the vicinity of the sun, and there is broken by the heat as a stone in a hot fire. (Sir Isaac Newton calculates, in an often quoted passage of the Principia, that the heat which the comet of 1680 was subjected to in its passage by the sun was 2000 times that of red-hot iron.) We have seen the way in which meteoric stones actually do crack in pieces with heat in our own atmosphere, partly, perhaps, from the expansion of the

METEORS OBSERVED NOVEMBER 13TH-14TH, 1868, BETWEEN MIDNIGHT AND FIVE O'CLOCK, A. M.
(PUBLISHED BY PERMISSION OF CHARLES SCRIBNER'S SONS.)

gases the stone contains, and it seems entirely reasonable to suppose that they may do so from the heat of the sun, and that the escaped gases may contribute something toward the formation of the tail, which is always turned away from the sun, and which always grows larger as that is approached, and smaller as it is receded from. However this may be, there is no doubt that the original solid which we here suppose may form the nucleus is capable of mischief, for it is asserted that it often passes the earth's orbit with a velocity of as much as one hundred times that of a cannon-ball; that is, with ten thousand times the destructive capacity of a ball of the same weight shot from a cannon.

One week later, October 9th, the comet had passed over Arcturus with a motion toward our left into a new region of the

sky, leaving Arcturus, which we can recognize with the upper one of its three little companions, on the right. Above it is the whole sickle of the Northern Crown, and over these stars the extremity of the now lengthened tail was seen to spread, but with so thin a veil that no art of the engraver can here adequately represent its faintness. The tail then, as seen in the sky, was now nearly twice its former size, though for the reason mentioned it may not appear so in our picture. It should be understood, too, that even the brightest parts of the original were far fainter than they seem here in comparison with the stars, which in the sky are brilliant points of light, which the engraver can only represent by dots of the whiteness of the paper. This being observed, it will be better understood that in the sky itself the faintest stars were viewed ap-

COMET OF DONATI, SEPTEMBER 16TH, 1858.*

parently undimmed through the brighter parts of the comet, while we can but faintly trace here another most faint but curious feature, a division of the tail into faint cross-bands like auroral streamers, giving a look as if it were yielding to a wind, which folded it into faint

ridges like those which may be seen in the smoke of a steamer as it lags far behind the vessel. In fact, when we speak of "the" tail it must be understood, as M. Faye reminds us, to be in the same sense that we speak of the plume of smoke that accompanies an ocean steamer, without meaning that it is the same thing which we are watching from night to night, more than we do that the same smoke-particles accompany the steamer as it moves across the Atlantic. In both cases the form alone probably remains; the thing itself is being incessantly dissipated and renewed. There is no air here, and yet some of these appearances in the original almost suggest the idea of medium inappreciably thin as compared with the head of the comet, but whose resistance is seen in the more unsubstantial tail, as that is drawn through it and bent backward, as if by a wind blowing toward the celestial pole.

The most notable feature, however, is the development of a second ray or spur, which has been apparently darted through millions of miles in the interval since we looked at it, and an almost imperceptible bending backward in both, as if they too felt the resistance of something in what we are accustomed to think of as an absolute and perfect void. These tails are a peculiarly mysterious feature. They are apparently shot out in a direction opposite to the sun (and consequently opposed to the

A PART OF A COMET.

COMET OF DONATI, SEPTEMBER 24TH, 1858. (TELESCOPIC VIEW OF HEAD.)

direction of gravity) at the rate of millions of miles a day.

Beyond the fact that the existence of some *repulsive* force in the sun, a "negative gravity" actually existent, not in fancy, but in fact, seems pointed at, astronomers can offer little but conjecture here; and while some conceive this force as of an electrical nature, others strenuously deny it. We ought to admit that up to the present time we really know nothing about it, except that it exists.

At this date (October 9th) the comet had made nearly its closest approach to the earth, and the general outline has been compared to that of the wing of some bird, while the actual size was so vast that even at the distance from which it was seen it filled an angle more than half of that from the zenith to the horizon.

All the preceding drawings have been from naked-eye views, but if the reader would like to look more closely he can see on page 354 one taken on the night of October 5th through the great telescope at Cambridge, Mass. We will leave this to tell its own story, only remarking that it is not possible to reproduce the phantom-like faintness of the original spur, here too distinctly seen, or indeed to indicate fairly the infinite tenuity of the tail

itself. Though millions of miles thick, the faintest star is yet perceptibly undimmed by it, and in estimating the character and quantity of matter it contains, after noting that it is not self-luminous, but shines only like the moon by reflected sunlight, we may recall the acute observation of Sir Isaac Newton where he compares the brightness of a comet's tail with that of the light reflected from the particles in a sunbeam an inch or two thick, in a darkened room, and, after observing that if a little sphere of common air one inch in diameter were rarified to the degree that must obtain at only 4000 miles from the earth's surface it would fill all the regions of the planets to far beyond the orbit of Saturn, suggests the excessively small quantity of vapor that is really requisite to create this prodigious phantom.

The writer has had occasion for many years to make a special study of the reflection of light from the sky, and if such studies may authorize him to express any opinion of his own, he would give his adhesion to the remark of Sir John Herschel, that the actual weight of matter in such a cometary tail may be conceivably only an affair of pounds or even ounces. But if this is true of the tail, it does not follow of the nucleus, just seen in this

COMET OF DONATI, OCTOBER 3D, 1858.

picture, but of which the engraving on page 351 gives a much more magnified view. It is a sketch of the head alone, taken from a telescopic view on the 24th of September. Here the direction of the comet is still toward the sun (which must be supposed to be some indefinite distance beyond the upper part of the drawing), and we see that the lucid matter appears to be first jetted up, and then forced backward on either side, as if by a wind *from* the sun, to form the tail, presenting successive crescent-shaped envelopes of decreasing brightness, which are not symmetrical, but one-sided, while sometimes the appearance is that of spurts of luminous smoke, wavering as if thrown out of particular parts of the internal nucleus "like a squib not held fast." Down the center of the tail runs a wonderfully straight black line, like a shadow cast from the nucleus. Only the nucleus itself still evades us, and even in this, the most magnified view which the most powerful telescope till lately in existence could give, remains a point.

Considering the distance of the comet and the other optical conditions, this is still perfectly consistent with the possibility that it may have an actual diameter of a hundred miles or more. It "may" have, observe, not it "has,"

for in fact we know nothing about it, but that it is at any rate less than some few hundred miles in diameter, and it may, for anything we can positively say, not be more than a very large stone, in which case our atmosphere would probably act as an efficient buffer if it struck us; or it may have a mass which, coupled with its terrible speed, would cause the shock of its contact not so much to pulverize the region it struck, as dissipate it and everything on it instantly into vapor.

Of the remarkable investigations of the spectroscope on comets, we have only room left to say that they inform us that the most prominent cometary element seems to be carbon,—carbon, which Newton two hundred years before the spectroscope, and before the term "carbonic-acid gas" was coined by some guess or divination, had described in other words, as possibly brought to us by comets to keep up the carbonic-acid-gas supply in our air,—carbon, which we find in our own bodies, and which, according to this view, the comets are original sources of.

That *we* may be partly made of old and used-up comets!—surely it might seem that a madder fancy never came from the brain of a lunatic at the full of the moon!

COMET OF DONATI, OCTOBER 9TH, 1858.

Science may easily be pardoned for not giving instant reception to such an idea, but let us also remember, first, that it is a consequence of that of Sir Isaac Newton, and that in the case of such a man as he we should not be

hasty to think we understand his ignorance, when we may be "ignorant of his understanding," and, second, that it has been rendered at least debatable by Dr. Hunt's recent researches whether it is possible to account for

COMET OF DONATI, OCTOBER 5TH, 1858. (TELESCOPIC VIEW.)

the perennial supply of carbon from the earth's atmosphere, without looking to some means of renewal external to the planet.

The old dread of comets is passing away, and all that science has to tell us of them indicates that, though still fruitful sources of curiosity and indeed wonder, they need no

longer be objects of terror. Though there be, as Kepler said, more comets in the sky than fish in the ocean, the encounter of the earth with a comet's tail would be like the encounter with a shadow, and the chance of a collision with the nucleus is remote indeed. We may sleep undisturbed though a new comet

is announced every month, though it is true that here as elsewhere lie remote possibilities of evil.

The consideration of the unfamiliar powers certainly latent in nature, such as belong to a little tremor of the planet's surface or such as was shown in that scene I have described, when the comparatively insignificant effect of the few tons of dynamite was to make solid buildings unrealities, which vanished away as quickly as magic-lantern pictures from a screen, may help us to understand that the words of the great poet are but the possible expression of a physical fact, and that "the cloud-capped towers, the gorgeous palaces, the solemn temples,"—and we with them,—may indeed conceivably some day vanish as the airy nothings

at the touch of Prospero's wand, and without the warning to us of a single instant that the security of our ordinary lives is about to be broken. We concede this, however, in the present case only as an abstract possibility; for the advance of astronomical knowledge is much more likely to show that the kernel of the comet is but of the bigness of some large meteorite, against which our air is an efficient shield, and the chance of evil is in any case most remote—in any case only such as may come in any hour of our lives from any quarter, not alone from the earthquake or the comet, but from "The pestilence that walketh in darkness"; from the infinitely little below and within us, as well as from the infinite powers of the universe without.

S. P. Langley.

CARANCRO.

BY GEORGE W. CABLE,

Author of "Old Creole Days," "The Grandissimes," "Dr. Sevier," etc.

IN TWO PARTS: PART I.

I. — SOSTHÈNE.

AYOU TECHE is the dividing line. On its right is the land of bayous, lakes, and swamps; on its left the beautiful short-turfed prairies of western Louisiana. The Vermillion river divides the vast prairie into the countries of Attakapas on the east and Opelousas on the west. On its west bank, at its head of navigation, lies the sorry little town of Vermillionville, near about which on the north and east the prairie rises and falls with a gentle swell, from whose crests one may, as from the top of a wave, somewhat overlook the surrounding regions.

Stand on whichever one you may, the prospect stretches away, fair and distant, in broad level or gently undulating expanses of crisp, compact turf, dotted at remote intervals by farms, each with its low-roofed house nestled in a planted grove of oaks, or, oftener, Pride of China trees. Far and near herds of horses and cattle roam at will over the plain. If for a moment, as you pass from one point of view to another, the eye be shut in, it is only where in some lane you are walled in by fields of dense, tall sugar-cane or cotton, or by huge, green Chickasaw hedges, studded with their white-petaled, golden-centered roses. Eastward the plain breaks into slight ridges which, by comparison with the general level, are called hills; while toward the north

it spreads away in quieter swells, with more frequent fields and larger houses.

North, south, east, and west, far beyond the circle of these horizons, not this parish of Lafayette only, but St. Landry, St. Martin, Iberia, St. Mary's, Vermillion,—all are the land of the Acadians. This quarter off here to northward was named by the Nova Scotian exiles, in memory of the land from which they were driven, the Beau Bassin. These small homestead groves that dot the plain far and wide are the homes of their children. Here is this one on a smooth, green billow of the land just without the town. It is not like the rest—a large brick house, its Greek porch half hid in a grove of oaks. On that dreadful day, more than a century ago, when the British in far-off Acadie shut into the chapel the villagers of Grand Pré, a certain widow fled with her children to the woods, and there subsisted for ten days on roots and berries. until finally, the standing crops as well as the houses being destroyed, she was compelled to accept exile, and in time found her way, with others, to these prairies. Her son founded Vermillionville. Her grandson rose to power—sat in the Senate of the United States. From early manhood to hale gray age the people of his State were pleased to hold him, now in one capacity, now in another, in their honored service; they made him Senator, Governor, President of Convention, what you will. I have seen the portrait for which he sat in early manhood to a noted English court painter: dark, waving

THE CONSCRIPT OFFICER.

locks; strong, well-chiseled features; fine, clear eyes; an air of warm, steady-glowing intellectual energy. It hangs still in the home of which I speak. And I have seen an old ambrotype of him taken in the days of this story: hair short-cropped, gray; eyes thoughtful, courageous; mouth firm, kind, and ready to smile.

It must have been some years before this picture was taken, that, as he issued from his stately porch,—which the oaks, young then, did not hide from view as they do now,—coming forth to mount for his regular morning ride, a weary-faced woman stood before him, holding by the hand a little, toddling boy. She was sick; the child was hungry. He listened to her tale. Their conversation was in French.

"Widow, are you? And your husband was a Frenchman: yes, I see. Are you an Acadian? You haven't the accent."

"I am a Creole," she said, with a perceptible flush of resentment. So that he responded amiably:

"Yes; and, like all Creoles, proud of it, as you are right to be. But I am an Acadian of

the Acadians, and never wished I was anything else."

He found her a haven a good half-day's ride out across the prairies westward in the home of his long-time acquaintance, Sosthène Gradnego, who had no more heart than his wife had to say no to either their eminent friend or a houseless widow; and so, as to children, had so many already that one more was nothing. They did not feel the burden of her, she died so soon; but they soon found she had left with them a positive quantity in her little prattling, restless, high-tempered Bonaventure. Bonaventure Deschamps; he was just two years younger than their own little Zoséphine.

Sosthène was already a man of some note in this region—a region named after a bird. Why would it not often be well so to name places—for the bird that most frequents the surrounding woods or fields? How pleasant to have one's hamlet called Nightingale, or Whip-poor-will, or Goldfinch, or Oriole! The home of Zoséphine and Bonaventure's childhood was in the district known as Carancro; in bluff English, Carrion Crow.

II. BONAVENTURE AND ZOSÉPHINE.

THEY did not live *a la chapelle*; that is, in the village of six or eight houses clustered about the small wooden spire and cross of the mission chapel. Sosthène's small ground-story cottage, with garret stairs outside in front on the verandah and its five-acre farm behind, was not even on a highway nor on the edge of any rich *bas fond*—creek-bottom. It was *au large*—far out across the smooth, unscarred turf of the immense prairie, conveniently near one of the clear, circular ponds—*marais*—which one sees of every size and in every direction on the seemingly level land. Here it sat, as still as a picture, within its hollow square of China trees, which every third year yielded their limbs for fuel; as easy to overlook the first time—as easy to see the next time—as a bird sitting on her eggs. Only the practiced eye could read aright the infrequent obscure signs of previous travel that showed the way to it—sometimes no more than the occasional soilure of the short turf by a few wheels or hoofs where the route led into or across the *coolées*—rivulets—that from *marais* to *marais* slipped southward toward the great marshes of the distant, unseen gulf.

When I say the parent of one of these two children and guardian of the other was a man of note, I mean, for one thing, his house was painted. That he was the owner of thousands of cattle one need not mention, for so were others who were quite inconspicuous, living in unpainted houses, rarely seeing milk, never tasting butter; men who at call of their baptismal names would come forth from these houses barefooted and bareheaded in any weather, and, while their numerous progeny grouped themselves in the doorway one behind another in inverse order of age and stature, would either point out your lost way, or, quite as readily as Sosthène, ask you in beneath a roof where the coffee-pot never went dry or grew cold by day. Nor would it distinguish him from them to say he had many horses or was always well mounted. It was a land of horsemen. One met them incessantly; men in broad hats and dull homespun, with thin, soft, untrimmed brown beards, astride of small but handsome animals, in Mexican saddles, the girths and bridles of plaited hair, sometimes a *pialle*, or *arriatte*—*lasso*—*lariat* of plaited raw-hide coiled at the saddle-bow. "Adieu, Onesime"—always adieu at meeting, the same as at parting. "Adieu, François; adieu, Christofle; adieu, Lazare;" and they with their gentle, brown-eyed, wild-animal gaze, "Adjieu."

What did make Sosthène notable was the quiet thing we call thrift, made graceful by

certain rudiments of taste. To say Sosthène means Madame Sosthène as well; and this is how it was that Zoséphine Gradnego and Bonaventure Deschamps, though they went not to school, nevertheless had "advantages." For instance, the clean, hard-scrubbed cypress floors beneath their pattering feet; the neat round parti-colored mats at the doors that served them for towns and villages; the strips of home-woven carpet that stood for roads—this one to Mermentau, that one to Côte Gelée, a third *a la chapelle*; the walls of unpainted pine; the beaded joists under the ceiling; the home-made furniture; bedsteads and wardrobes of stained woods, and hickory chairs with rawhide seats, hair uppermost; the white, fringed counterpanes on the high feather-beds; especially, in the principal room, the house's one mantelpiece, of wood showily stained in three colors and surmounted by a pair of gorgeous vases beneath which the two children used to stand and feast their eyes, worth fifty cents if they were worth one—these were as books to them in-doors; and out in the tiny garden, where they played wild horse and wild cow and lay in ambush for butterflies, they came under the spell of marigolds, prince's feathers, lady-slippers, immortelles, portulaca, jonquil, lavender, althæa, love-apples, sage, violets, amaryllis, and that grass ribbon they call *jarretièrre de la vierge*—the virgin's garter.

Time passed; the children grew. The children older than they in the same house became less and less like children, and began to disappear from the family board and roof by a mysterious process called marrying, which greatly mystified Zoséphine, but equally pleased her by the festive and jocund character of the occasions, times when there was a ravishing abundance of fried rice cakes and *boulettes*—beef balls.

To Bonaventure these affairs brought less mystery and less unalloyed pleasure. He understood them better. Some boys are born lovers. From the time they can reach out from the nurse's arms they must be billing and cooing and choosing a mate. Such was ardent little Bonaventure; and none of the Gradnego weddings ever got quite through its ceremony without his big blue eyes being found full of tears—tears of mingled anger and desolation—because by some unpardonable oversight he and Zoséphine were still left unmarried. So that the pretty damsel would have to take him aside and kiss him as they clasped, and promise him, "Next time—next time, without fail!"

Nevertheless he always reaped two proud delights from these events. For one, Sosthène always took him upon his lap and introduced

him as his little Creole. And the other, the ex-governor came to these demonstrations—the great governor! who lifted him to his knee and told him of those wonderful things called cities, full of people that could read and write; and about steamboats and steam cars.

At length one day, when weddings had now pretty well thinned out the ranks of Sosthène's family, the ex-governor made his appearance though no marriage was impending. Bonaventure, sitting on his knee, asked why he had come, and the ex-governor told him there was war.

"Do you not want to make haste and grow up and be a dragoon?"

The child was silent, and Sosthène laughed a little as he said privately in English, which tongue his exceptional thrift had put him in possession of:

"Aw, naw!" — he shook his head amusedly — "he dawn't like hoss. Go to put him on hoss, he kick like a frog. Yass; squeal wuss 'n a pig. But still, sem time, you know, he ain't no coward; git mad in minute; fight like little ole ram. Dawn't ondstand dat little fellow; he love flower' like he was a gal."

"He ought to go to school," said the ex-governor. And Sosthène, half to himself, responded in a hopeless tone:

"Yass." Neither Sosthène nor any of his children had ever done that.

III. ATHANASIUS.

WAR it was. The horsemen grew scarce on the wide prairies of Opelousas. Far away in Virginia, Tennessee, Georgia, on bloody fields, many an Acadian volunteer and many a poor conscript fought and fell for a cause that was really none of theirs, simple, non-slave-holding peasants; and many died in camp and hospital — often of wounds, often of fevers, often of mere longing for home. Bonaventure and Zoséphine learned this much of war: that it was a state of affairs in which dear faces went away, and strange ones came back with tidings that brought bitter wailings from mothers and wives, and made *les vieux* — the old fathers — sit very silent. Three times over that was the way of it in Sosthène's house.

It was also a condition of things that somehow changed boys into men very young. A great distance away, but still in sight southward across the prairie, a dot of dark green showed where dwelt a sister and brother-in-law of Sosthène's *vieille* — wife. There was not the same domestic excellence there as at Sosthène's; yet the dooryard was very populous with fowls, within the house was always heard the hard thump, thump of the loom or the loud moan of the spinning-wheel; and the children were many. The eldest was Atha-

nase. Though but fifteen he was already stalwart, and showed that intelligent sympathy in the family cares that make such offspring the mother's comfort and the father's hope. At that age he had done but one thing to diminish that comfort or that hope. One would have supposed an ambitious chap like him would have spent his first earnings, as other ambitious ones did, for a saddle; but 'Thanase Beausoliel had bought a fiddle.

He had hardly got it before he knew how to play it. Yet, to the father's most welcome surprise, he remained just as bold a rider and as skillful a thrower of the *arriatte* as ever. He came into great demand for the Saturday night balls. When the courier with a red kerchief on a wand came galloping round, the day before, from *île* to *île*, — for these descendants of a maritime race call their homestead groves islands, — to tell where the ball was to be, he would assert, if there was even a hope of it, that 'Thanase was to be the fiddler.

In this way 'Thanase and his pretty little *jarmaine* — first cousin — Zoséphine, now in her fourteenth year, grew to be well acquainted. For at thirteen, of course, she began to move in society, which meant to join in the contra-dance. 'Thanase did not dance with her, or with any one. She wondered why he did not; but many other girls had similar thoughts about themselves. He only played, his playing growing better and better, finer and finer, every time he was heard anew. As to the few other cavaliers, very willing were they to have it so. The music could not be too good, and if 'Thanase was already perceptibly a rival when hoisted up in a chair on top of a table, fiddle and bow in hand, "twisting," to borrow their own phrase — "twisting the ears of that little red beast and rubbing his abdomen with a stick," it was just as well not to urge him to come down into the lists upon the dancing floor. But they found one night, at length, that the music could be too good — when 'Thanase struck up something that was not a dance, and lads and damsels crowded around standing and listening and asking ever for more, and the ball turned out a failure because the concert was such a success.

The memory of that night was of course still vivid next day, Sunday, and Zoséphine's memory was as good as any one's. I wish you might have seen her in those days of the early bud. The time had returned when Sosthène could once more get all his household — so had marriages decimated it — into one vehicle, a thing he had not been able to do for almost these twenty years. Zoséphine and Bonaventure sat on a back seat contrived for them in the family *calèche*. In front were the broad-brimmed Campeachy hat of Sosthène

and the meek, limp sunbonnet of *la vicille*. About the small figure of the daughter there was always something distinguishing, even if you rode up from behind, that told of youth, of mettle, of self-regard; a neatness of fit in the dress, a firm erectness in the little slim back, a faint proudness of neck, a glimpse of ribbon at the throat, another at the waist; a something of assertion in the slight crispness of her homespun sunbonnet, and a ravishing glint of two sparks inside it as you got one glance within — no more. And as you rode on, if you were a young blade, you would be — as the soldier lads used to say — all curled up; but if you were an old mustache, you would smile inwardly and say to yourself, “She will have her way; she will make all winds blow in her chosen direction; she will please herself; she will be her own goodluck and her own commander-in-chief, and, withal, nobody’s misery or humiliation, unless you count the swain after swain that will sigh in vain.” As for Bonaventure, sitting beside her, you could just see his bare feet limply pendulous under his wide palm-leaf hat. And yet he was a very real personage.

“Bonaventure,” said Zoséphine, — this was as they were returning from church, the wide raw-hide straps of their huge wooden two-wheeled vehicle creaking, as a new saddle would if a new saddle were as big as a house, — “Bonaventure, I wish you could learn how to dance. I am tired trying to teach you.” (This and most of the unbroken English of this story stands for Acadian French.)

Bonaventure looked meek for a moment and then resentful as he said:

“’Thanase does not dance.”

“’Thanase! Bah! What has ’Thanase to do with it? Who was even thinking of ’Thanase? Was he there last night? Ah yes! I just remember now he was. But even he could dance if he chose; while you — you can’t learn! You vex me. ’Thanase! What do you always bring him up for? I wish you would have the kindness just not to remind me of him! Why does not some one tell him how he looks, hoisted up with his feet in our faces, scratching his fiddle? Now, the fiddle, Bonaventure — the fiddle would just suit you. Ah, if you could play!” But the boy’s quick anger so flashed from his blue eyes that she checked herself and with contemplative serenity added:

“Pity nobody else can play so well as that tiresome fellow. It was positively silly, the way some girls stood listening to him last night. I’d be ashamed, or, rather, too proud, to flatter such a high-headed care-for-nobody. I wish he wasn’t my cousin!”

Bonaventure, still incensed, remarked with quiet intensity that he knew why she wished ’Thanase was not a cousin.

“It’s no such a thing!” exclaimed Zoséphine so forcibly that Madame Sosthène’s sunbonnet turned around, and a murmur of admonition came from it. But the maiden was smiling and saying blithely to Bonaventure:

“Oh, you — you can’t even guess well.” She was about to say more, but suddenly hushed. Behind them a galloping horse drew near, softly pattering along the turfy road. As he came abreast, he dropped into a quiet trot.

The rider was a boyish yet manly figure in a newsuit of gray home-made linsey, the pantaloons thrust into the tops of his sturdy russet boots, and the jacket ending underneath a broad leather belt that carried a heavy revolver in its holster at one hip. A Campeachy hat shaded his face and shoulders, and a pair of Mexican spurs tinkled their little steel bells against their huge five-spiked rowels on his heels. He scarcely sat in the saddle-tree — from hat to spurs you might have drawn a perpendicular line. It would have taken in shoulders, thighs, and all.

“Adjieu,” said the young centaur; and Sosthène replied from the creaking calèche, “Adjieu, ’Thanase,” while the rider bestowed his rustic smile upon the group. Madame Sosthène’s eyes met his, and her lips moved in an inaudible greeting; but the eyes of her little daughter were in her lap. Bonaventure’s gaze was hostile. A word or two passed between uncle and nephew, including a remark and admission that the cattle thieves were getting worse than ever; and with a touch of the spur, the young horseman galloped on.

It seems enough to admit that Zoséphine’s further remarks were silly without reporting them in full.

“Look at his back! What airs! If I had looked up, I should have laughed in his face!” etc. “Well,” she concluded, after much such chirruping, “there’s one comfort — he doesn’t care a cent for me. If I should die to-morrow, he would forget to come to the funeral. And you think I wouldn’t be glad? Well, you’re mistaken, as usual. I hate him, and I just know he hates me; everybody hates me!”

The eyes of her worshiper turned upon her. But she only turned her own away across the great plain to the vast arching sky, and patted the calèche with a little foot that ached for deliverance from its Sunday shoe. Then her glance returned, and all the rest of the way home she was as sweet as the last dip of cane-juice from the boiling battery.

IV. THE CONSCRIPT OFFICER.

By and by ’Thanase was sixteen. Eighteen was the lowest age for conscription, yet he was in the Confederate uniform. But then so

was his uncle Sosthène; so was his father. It signified merely that he had been received into the home guard. The times were sadly unsettled. Every horseman, and how much more every group of horsemen, that one saw coming across the prairie was watched by anxious eyes, from the moment they were visible specks, to see whether the uniform would turn out to be the blue or the gray. Which was the more unwelcome I shall not say, but this I can, that the blue meant invasion and the gray meant conscription. Sosthène was just beyond the limit of age, and 'Thanase two years below it, but 'Thanase's father kept a horse saddled all the time, and slept in-doors only on stormy nights.

Do not be misled: he was neither deserter nor coward; else the nickname which had quite blotted out his real name would not have been Chaouache — savage, Indian. He was needed at home, and — it was not his war. His war was against cattle-thieves and like marauders, and there was no other man in all Carancro whom these would not have had on their track rather than him. But one gray dawn they found there was another not unlike him. They had made an attempt upon Sosthène's cattle one night; had found themselves watched and discovered; had turned and fled westward half the night, and had then camped in the damp woods of a *bas fond*; when, just as day was breaking and they were looking to their saddles about to mount — there were seven of them — just then — listen! — a sound of hoofs!

Instantly every left foot is in stirrup, but before they can swing into the saddle a joyous cry is in their ears, and pop! pop! pop! pop! ring the revolvers as, with the glad, fierce cry still resounding, three horsemen launch in upon them — only three, but those three a whirlwind. See that riderless horse, and this one, and that one! And now for it — three honest men against four remaining thieves! Pop! pop! dodge, and fire as you dodge! Pop! pop! pop! down he goes; well done, gray-bearded Sosthène! Shoot there! Wheel here! Wounded? Never mind — ora! Another rogue reels! Collar him, Chaouache! drag him from the saddle — down he goes! What, again! Shoot there! Look out, that fellow's getting away! Ah! down goes Sosthène's horse, breaking his strong neck in the tumble. Up, bleeding old man — bang! bang! Ha, ha, ora! that finishes — ora! 'Twas the boy saved your life with that last shot, Sosthène, and the boy — the youth is 'Thanase.

He has not stopped to talk; he and his father are catching the horses of the dead and dying jayhawkers. Now bind up Sosthène's head, and now 'Thanase's hip. Now strip the dead beasts and take the dead men's weapons,

boots, and spurs. Lift this one moaning villain into his saddle and take him along, though he is going to die before ten miles are gone over. So they turn homeward, leaving high revel for the carrion-crows.

Think of Bonaventure, the slender, the intense, the reticent — with 'Thanase limping on rude but glorious crutches for four consecutive Saturdays and Sundays up and down in full sight of Zoséphine, savior of her mother from widowhood, owner of two fine captured horses, and rewarded by Sosthène with five acres of virgin prairie. If the young fiddler's music was an attraction before, fancy its power now, when the musician had to be lifted to his chair on top of the table.

Bonaventure sought comfort of Zoséphine, and she gave it, tittering at 'Thanase behind his back, giving Bonaventure knowing looks, and sticking her sunbonnet in her mouth.

"Oh, if the bullet had only gone into the dandy's fiddle-bow arm!" she whispered gleefully.

"I wish he might never get well!" said the boy.

The girl's smile vanished; her eyes flashed lightning for an instant; the blood flew to her cheeks, and she bit her lip.

"Why don't you, now while he cannot help himself — why don't you go to him and hit him square in the face, like —" her arm flew up, and she smote him with her sunbonnet full between the eyes — "like that!" She ran away, laughing joyously, while Bonaventure sat down and wept with rage and shame.

Day by day he went about his trivial tasks and efforts at pastime with the one great longing that Zoséphine would more kindly let him be her slave, and something — anything — take 'Thanase beyond-reach.

Instead of this 'Thanase got well, and began to have a perceptible down on his cheek and upper lip, to the great amusement of Zoséphine.

"He had better take care," she said one day to Bonaventure, her eyes leaving their mirth and expanding with sudden seriousness, "or the conscript officer will be after him, though he is but sixteen."

Unlucky word. Bonaventure's bruised spirit seized upon the thought. They were on their way even then *a la chapelle*; and when they got there he knelt before Mary's shrine and offered the longest and most earnest prayer, thus far, of his life, and rose to his feet under a burden of guilt he had never known before.

It was November. The next day the wind came hurtling over the plains out of the northwest, bitter cold. The sky was all one dark gray. At evening it was raining. Sosthène said, as he sat down to supper, that it was

going to pour and blow all night. Chaouache said much the same thing to his wife as they lay down to rest. Farther away from Carancro than many of Carancro's people had ever wandered, in the fire-lighted public room of a village tavern, twelve or fifteen men were tramping busily about, in muddy boots and big clanking spurs, looking to pistols and carbines of miscellaneous patterns, and securing them against weather under their as yet only damp and slightly bespattered great-coats, no two of which were alike. They spoke to each other sometimes in French, sometimes in English that betrayed a Creole rather than an Acadian accent. A young man with a neat *kepi* tipped on one side of his handsome head stood with his back to the fire, a saber dangling to the floor from beneath a captured Federal overcoat. A larger man was telling him a good story. He listened smilingly, dropped the remnant of an exhausted cigarette to the floor, put his small, neatly booted foot upon it, drew from his bosom one of those silken tobacco-bags that our sisters in war-time used to make for all the soldier boys, made a new cigarette, lighted it with the flint and tinder for which the Creole smokers have such a predilection, and put away his appliances, still hearkening to the story. He nodded his head in hearty approval as the tale was finished. It was the story of Sosthène, Chaouache, 'Thanase, and the jayhawkers. He gathered up his saber and walked out, followed by the rest. A rattle of saddles, a splashing of hoofs, and then no sound was heard but the wind and the pouring rain. The short column went out of the village at full gallop.

Day was fully come when Chaouache rose and stepped out upon his *galérie*. He had thought he could venture to sleep in bed such a night; and, sure enough, here morning came and there had been no intrusion. 'Thanase, too, was up. It was raining and blowing still. Across the prairie, as far as the eye could reach, not a movement of human life could be seen. They went in again, made a fire of a few fagots and an armful of cotton-seed, hung the kettle, and emptied the old coffee from the coffee-pot.

The mother and children rose and dressed. The whole family huddled around the good, hot, cotton-seed fire. No one looked out of window or door: in such wind and rain where was the need? In the little log stable hard by, the two favorite saddle-horses remained unsaddled and unbridled. The father's and son's pistol belts, with revolvers buttoned in their holsters, hung on the bedposts by the headboards of their beds. A long sporting rifle leaned in a corner near the chimney.

Chaouache and 'Thanase got very busy

plaiting a horse-hair halter, and let time go by faster than they knew. Madame Chaouache, so to call her, prepared breakfast. The children played with the dog and cat. Thus it happened that still nobody looked out into the swirling rain. Why should they? Only to see the wide, deluged plain, the round, drenched groves, the *marais* and sinuous *coolées* shining with their floods, and long lines of benumbed, wet cattle seeking in patient, silent Indian file for warmer pastures. They knew it all by heart.

Yonder farthest *île* is Sosthène's. The falling flood makes it almost undiscernible. Even if one looked, he would not see that a number of horsemen have come softly plashing up to Sosthène's front fence, for Sosthène's house and grove are themselves in the way. They spy Bonaventure. He is just going in upon the *galérie* with an armful of China-tree fagots. Through their guide and spokesman they utter, not the usual halloo, but a quieter hail, with a friendly beckon.

"Adjieu." The men were bedraggled, and so wet one could not make out the color of the dress. One could hardly call it a uniform, and pretty certainly it was not blue.

"Adjieu," responded Bonaventure, with some alarm; but the spokesman smiled reassuringly. He pointed far away south-westward, and asked if a certain green spot glimmering faintly through the rain was not Chaouache's *île*, and Bonaventure, dumb in the sight of his prayer's answer, nodded.

"And how do you get there?" the man asks, still in Acadian French; for he knows the prairies well enough to be aware that one needs to know the road even to a place in full view across the plain. Bonaventure, with riot in his heart, and knowing he is drifting over the cataract of the sinfulest thing that ever in his young life he has had the chance to do, softly lays down his wood and comes to the corner of the *galérie*.

It is awful to him, even while he is doing it, the ease with which he does it. If, he says, they find it troublesome crossing the marshy place by Numa's farm,—*le platin à côte d'i' habitation à Numa*,—then it will be well to *virer de bord*—go about *et naviguer au large*—sail across the open prairie. "Adjieu." He takes up his fagots again and watches the spattering squad trot away in the storm, wondering why there is no storm in his own heart.

They are gone. Sosthène, inside the house, has heard nothing. The storm suffocates all sounds not its own, and the wind is the wrong way anyhow. Now they are far out in the open. Chaouache's *île* still glimmers to them far ahead in the distance, but if some one could only look from the front window of its

dwelling, he would see them coming. And that would spoil the fun. So they get it into line with another man's grove nearer by, and under that cover quicken to a gallop. Away, away; splash, splash, through the *coolées*, around the *marais*, clouds of wild fowl that there is no time to shoot into rising now on this side now on that; snipe without number, gray as the sky, with flashes of white, trilling petulantly as they flee; giant snowy cranes lifting and floating away on waving pinions, and myriads of ducks in great eruptions of hurtling, whistling wings. On they gallop; on they splash; heads down; water pouring from soaked hats and caps; cold hands beating upon wet breasts; horses throwing steaming muzzles down to their muddy knees and shaking the rain from their worried ears; so on and on and on.

The horse-hair halter was nearly done. The breakfast was smoking on the board. The eyes of the family group were just turning toward it with glances of placid content, when a knock sounded on the door, and almost before father or son could rise or astonishment dart from eye to eye, the door swung open, and a man stood on the threshold, all mud and water and weapons, touching the side of his cap with the edge of his palm and asking in French, with an amused smile forcing its way about his lips:

"Can fifteen of us get something to eat, and feed our horses?"

Chaouache gave a vacant stare and silently started toward the holsters that hung from the bedpost; but the stranger's right hand flashed around to his own belt, and, with a repeater half drawn, he cried:

"Halt!" And then, more quietly, "Look out of the door, look out the window."

Father and son looked. The house was surrounded.

Chaouache turned upon his wife one look of silent despair. Wife and children threw themselves upon his neck, weeping and wailing. "Thanase bore the sight a moment, maybe a full minute; then drew near, pressed the children with kind firmness aside, pushed between his father and mother, took her tenderly by the shoulders, and said in their antique dialect, with his own eyes brimming:

"Hush! hush! he will not have to go."

At a gentle trot the short column of horsemen moves again, but with its head the other way. The wind and rain buffet and pelt horse and rider from behind. Chaouache's door is still open. He stands in it with his red-eyed wife beside him and the children around them, all gazing mutely, with drooping heads and many a slow tear, after the departing cavalcade.

None of the horsemen look back. Why should they? To see a barefoot man beside a

woman in dingy *volante* and *casquin*, with two or three lads of ten or twelve in front, whose feet have known sunburn and frost but never a shoe, and a damsel or two in cotton homespun dress made of one piece from collar to hem, and pantalettes of the same reaching to the ankles—all standing and looking the picture of witless incapacity, and making no plea against tyranny! Is that a thing worth while to turn and look back upon? If the blow fell upon ourselves or our set, that would be different; but these illiterate and lowly ones—they are—you don't know—so dull and insensible. Yes, it may be true that it is only *some* of them who feel less acutely than *some* of us—we admit that generously; but when you insinuate that when we overlook parental and fraternal anguish tearing at such hearts the dullness and insensibility are ours, you make those people extremely offensive to us, whereas you should not estrange them from our tolerance.

Ah, poor unpitied mother! go back to your toils; they are lightened now—a little; the cooking, the washing, the scrubbing. Spread, day by day, the smoking board, and call your spared husband and your little ones to partake; but you—your tears shall be your meat day and night, while underneath your breath you moan, "Thanase! Thanase!"

V. THE CURÉ OF CARANCRO.

It was an unexpected and capital exchange. They had gone for a conscript; they came away with a volunteer.

Bonaventure sat by the fire in Sosthène's cottage, silent and heavy, holding his small knees in his knit hands and gazing into the flames. Zoséphine was washing the household's few breakfast dishes. *La vieille*—the mother—was spinning cotton. *Le vieux*—Sosthène—sat sewing up a rent in a rawhide chair bottom. He paused by and by, stretched, and went to the window. His wife caught the same spirit of relaxation, stopped her wheel, looked at the boy moping in the chimney corner, and, passing over to his side, laid a hand upon his temple to see if he might have fever.

The lad's eyes did not respond to her; they were following Sosthène. The husband stood gazing out through the glass for a moment, and then, without moving, swore a long, slow execration. The wife and daughter pressed quickly to his either side and looked forth.

There they came, the number increased to eighteen now, trotting leisurely through the subsiding storm. The wife asked what they were, but Sosthène made no reply; he was counting them: twelve, thirteen, fourteen—fourteen

with short guns, another one who seemed to wear a sword, and three, that must be —

"Cawnscreep," growled Sosthène, without turning his eyes. But the next moment an unusual sound at his elbow drew his glance upon Zoséphine. "*Diab!e!*" He glared at her weeping eyes, his manner demanding of her instant explanation. She retreated a step, moved her hand toward the approaching troop, and cried distressfully:

"*Tu va oère!*"—"You will see!"

His glance was drawn to Bonaventure. The lad had turned toward them, and was sitting upright, his blue eyes widened, his face pale, and his lips apart; but ere Sosthène could speak his wife claimed his attention.

"Sosthène!" she exclaimed, pressing against the window-pane, "Ah, Sosthène! Ah, ah! they have got 'Thanase!"

Father, mother, and daughter crowded against the window and one another, watching the body of horse as it drew nigh. Bonaventure went slowly and lay face downward on the bed.

Now the dripping procession is at hand. They pass along the dooryard fence. At the little garden gate they halt. Only 'Thanase dismounts. The commander exchanges a smiling word or two with him, and the youth passes through the gate, and, while his companions throw each a tired leg over the pommel and sit watching him, comes up the short, flowery walk and in at the opening door.

There is nothing to explain, they have guessed it; he goes in his father's stead. There is but a moment for farewells.

"Adjieu, Bonaventure."

The prostrate boy does not move. 'Thanase strides up to the bed and looks at one burning cheek, then turns to his aunt.

"*Li malade?*"—"Is he ill?"

"*Sa l'air a ca,*" said the aunt. (*Il a l'air*—he seems so.)

"Bien, n'onc' Sosthène, adjieu." Uncle and nephew shake hands stoutly. "Adjieu," says the young soldier again, to his aunt. She gives her hand and turns to hide a tear. The youth takes one step toward Zoséphine. She stands dry-eyed, smiling on her father. As the youth comes her eyes, without turning to him, fill. He puts out his hand. She lays her own on it. He gazes at her for a moment, with beseeching eye—"Adjieu." Her eyes meet his one instant—she leaps upon his neck—his strong arms press her to his bosom—her lifted face lights up—his kiss is on her lips—it was there just now, and now—'Thanase is gone and she has fled to an inner room.

Bonaventure stood in the middle of the floor. Why should the boy look so strange? Was it anger, or fever, or joy? He started out.

"*A ou-ce-tu va Bonaventure?*"—"Whereabouts are you going?"

"*Va crier les vaches.*"—"Going to call the cows."

"At this time of day?" demanded *la vieille*, still in the same tongue. "Are you crazy?"

"Oh!—no!" the boy replied, looking dazed. "No," he said; "I was going for some more wood." He went out, passed the woodpile by, got round behind a corn crib, and stood in the cold, wet gale watching the distant company lessening on the view. It was but a short, dim, dark streak creeping across the field of vision like some slow insect on a window-glass. A spot just beyond it was a grove that would presently shut the creeping line finally from sight. They reached it, passed beyond, and disappeared; and then Bonaventure took off the small, soft-brimmed hat that hung about his eyes, and, safe from the sight and hearing of all his tiny world, lifted his voice, and with face kindling with delight swung the sorry covering about his head and cried three times:

"Ora! Or-r-ra! Ora-a-a-a!"

But away in the night Madame Sosthène, hearing an unwonted noise, went to Bonaventure's bedside and found him sobbing as if his heart had broken.

"He has had a bad dream," she said; for he would not say a word.

The curé of Carancro was a Creole gentleman who looked burly and hard when in meditation; but all that vanished when he spoke and smiled. In the pocket of his cassock there was always a deck of cards, but that was only for the game of solitaire. You have your pipe or cigar, your flute or violoncello; he had his little table under the orange tree and his game of solitaire.

He was much loved. To see him beyond earshot talking to other men you would say he was by nature a man of affairs, whereas, when you came to hear him speak you find him quite another sort: one of the Elisha kind, as against the Elijahs; a man of the domestic sympathies, whose influence on man was personal and familiar; one of the sort that heal bitter waters with a handful of salt, make poisonous pottage wholesome with a little meal, and find easy, quiet ways to deliver poor widows from their creditors with no loss to either; a man whom men revered, while women loved and children trusted him.

The ex-governor was fond of his company, although the curé only smiled at politics and turned the conversation back to family matters. He had a natural gift for divining men's, women's, children's personal wants, and every one's distinctively from every other one's. So that to everybody he was an actual personal friend.

He had been a long time at Carancro. It was he who buried Bonaventure's mother. He was the connecting link between Bonaventure and the ex-governor. Whenever the curé met this man of worldly power there were questions asked and answered about the lad.

A little while after 'Thanase's enlistment the priest and the ex-governor, who, if I remember right, was home only transiently from camp, met on the court-house square of Vermillionville, and stood to chat a bit while others contemplated from across the deep, red mud of the street these two interesting representatives of sword and gown. Two such men standing at that time must naturally, one would say, have been talking of the strength of the defenses around Richmond, or the Emperor Maximilian's operations in Mexico, or Kirby Smith's movements, hardly far enough away to make it seem comfortable. But in reality they were talking about 'Thanase.

"He cannot write," said the curé; "and if he could, no one at home could read his letters."

The ex-governor promised to look after him.

"And how," he asked, "does Sosthène's little orphan get on?"

The curé smiled. "He is well — physically. A queer, high-strung child; so old, yet so young. In some things he will be an infant as long as he lives; in others, he has been old from the cradle. He takes everything in as much earnest as a man of fifty. What is to become of him?"

"Oh, he will come out all right," said the ex-governor.

"That depends. Some children are born with fixed characters: you can tell almost from the start what they are going to be. Be they much or little, they are complete in themselves, and it makes comparatively little difference into what sort of a world you drop them."

"'Thanase, for instance," said the ex-governor.

"Yes, you might say 'Thanase; but never Bonaventure. He is the other type; just as marked and positive traits, but those traits not yet builded into character: a loose mass of building material, and the beauty or ugliness to which such a nature may arrive depends on who and what has the building of it into form. What he may turn out to be at last will be no mere product of circumstances; he is too original for that. Oh, he's a study! Another boy under the same circumstances might turn out entirely different; and yet it will make an immense difference how his experiences are allowed to combine with his nature." The speaker paused a moment, while Bonaventure's other friend stood smiling with interest; then

the priest added, "He is just now struggling with his first great experience."

"What is that?"

"It belongs," replied the curé, smiling in his turn, "to the confidences of the confessional. But," he added, with a little anxious look, "I can tell you what it will do; it will either sweeten his whole nature more and more or else make it more and more bitter, from this time forth. And that is no trifle to you or me; for whether for good or bad, in a large way or in a small way, he is going to make himself felt."

The ex-governor mused. "I'm glad the little fellow has you for a friend, father. — I'll tell you; if Sosthène and his wife will part with him and you will take him to live with you, and, mark you, not try too hard to make a priest of him, I will bear his expenses."

"I will do it," said the curé.

It required much ingenuity of argument to make the Gradnego pair see the matter in the desired light; but when the curé promised Sosthène that he would teach the lad to read and write, and then promised *la vieille* that Zoséphine should share this educational privilege with him, they let him go.

Zoséphine was not merely willing, but eager to see the arrangements made. She beckoned the boy aside and spoke to him alone.

"You must go, Bonaventure. You will go, will you not — when I ask you? Think how fine that will be — to be educated! For me, I cannot endure an uneducated person. But — ah! *ca sré vaillant, pour savoir lire*. [It will be bully to know how to read.] *Aié ya yaie!*" — she stretched her eyes and bit her lip with delight — "*C'est t'y qui, pour savoir écrire!*" [That's fine to know how to write.] I will tell you a secret, dear Bonaventure. Any girl of sense is *bound* to think it much greater and finer for a man to read books than to ride horses. She may not want to, but she has to do it; she can't help herself!"

Still Bonaventure looked at her mournfully. She tried again.

"When I say any girl of sense I include myself — of course! I think more of a boy — or man, either — who can write letters than of one who can play the fiddle. There, now, I have told you! And when you have learned those things, I will be proud of you! And besides, you know, if you don't go, you make me lose my chance of learning the same things; but if you go, we will learn them together!"

He consented. She could not understand the expression of his face. She had expected gleams of delight. There were none. He went with silent docility and without a tear; but also without a smile. When in his new home the curé from time to time stole glances at his

"ADJIEU."

face fixed in unconscious reverie, it was full of a grim, unhappy satisfaction.

"Self is winning or dying hard. I wish no ill to 'Thanase ; but if there is to be any bad

news of him, I hope, for the sake of this boy's soul, it will come quickly." So spoke the curé alone, to his cards.

George W. Cable.

(To be concluded.)

ABRAHAM LINCOLN: A HISTORY.*

BY JOHN G. NICOLAY AND JOHN HAY, PRIVATE SECRETARIES TO THE PRESIDENT.

LINCOLN IN SPRINGFIELD.

MR. LINCOLN had made thus far very little money — nothing more, in fact, than a bare subsistence of the most modest character. But he had made some warm friends, and this meant very much among the early Illinoisians. He had become intimately acquainted, at Vandalia, with William Butler, who was greatly interested in the removal of the capi-

WILLIAM BUTLER. (FROM A PHOTOGRAPH TAKEN ABOUT 1850, IN POSSESSION OF HIS DAUGHTER, MISS SALOME BUTLER.)

tal to Springfield, and who urged the young legislator to take up his residence at the new seat of government. Lincoln readily fell in with this suggestion, and accompanied his friend home when the Legislature adjourned, sharing the lodging of Joshua F. Speed, a young Kentucky merchant, and taking his meals at the house of Mr. Butler for several years.

In this way began Mr. Lincoln's residence in Springfield, where he was to remain until called to one of the highest of destinies in-

trusted to men, and where his ashes were to rest forever in monumental marble. It would have seemed a dreary village to any one accustomed to the world, but in a letter written about this time, Lincoln speaks of it as a place where there was a "good deal of flourishing about in carriages"—a town of some pretensions to elegance. It had a population of fifteen hundred. The county contained nearly eighteen thousand souls, of whom seventy-eight were free negroes, twenty registered indentured servants, and six slaves. Scarcely a perceptible trace of color, one would say, yet we find in the Springfield paper a leading article† beginning with the startling announcement, "Our State is threatened to be run over with free negroes." The county was one of the richest in Illinois, possessed of a soil of inexhaustible fertility, and divided to the best advantage between prairie and forest. It was settled early in the history of the State, and the country was held in high esteem by the aborigines. The name of Sangamon is said to mean in the Pottawatomie language "land of plenty."‡ Its citizens were of an excellent class of people, a large majority of them from Kentucky, though representatives were not wanting from the Eastern States, men of education and character. There had been very little of what might be called pioneer life in Springfield. Civilization came in with a reasonably full equipment at the beginning. The Edwardses in fair top-boots and ruffled shirts; the Ridgelys brought

their banking business from Maryland; the Logans and Conklings were good lawyers before they arrived; another family came with a cotton manufactory from Kentucky, which proved its aristocratic character by never doing any work. With a population like this, the town had, from the beginning, a more settled and orderly type than was usual in the South and West. A glance at the advertising columns of the newspaper will show how much

† "Sangamon Journal," November 7, 1835.

‡ Reynolds's "Life and Times," p. 237.

JOSHUA SPEED AND WIFE. (FROM A PAINTING BY HEALY, ABOUT 1864.)

attention to dress was paid in the new capital. "Cloths, cassinetts, cassimeres, velvet, silk, satin, and Marseilles vestings, fine calf boots, seal and morocco pumps, for gentlemen," and for the sex which in barbarism dresses less and in civilization dresses more than the male, "silks, barèges, crêpe lisse, lace veils, thread lace, Thibet shawls, lace handkerchiefs, fine prunella shoes, etc." It is evident that the young politician was confronting a social world more formidably correct than anything he had as yet seen.

Governor Ford began some years before this to remark with pleasure the change in the dress of the people of Illinois: the gradual disappearance of leather and linsey-woolsey, the hunting-knife and tomahawk, from the garb of men; the deer-skin moccasin supplanted by the leather boot and shoe; the leather breeches tied around the ankle replaced by the modern pantaloons; and the still greater improvement in the adornment of women, the former bare feet decently shod, and homespun frocks giving way to gowns of calico and silk, and the heads tied up in red cotton turbans disappearing in favor of those surmounted by pretty bonnets of silk or straw. We admit that these changes were not

unattended with the grumbling ill-will of the pioneer patriarchs; they predicted nothing but ruin to a country that thus forsook the old ways "which were good enough for their fathers." But with this change in dress came other alterations which were all for the better—a growing self-respect among the young; an industry and thrift by which they could buy good clothes; a habit of attending religious service, where they could show them; a progress in sociability, civility, trade, and morals.*

The taste for civilization had sometimes a whimsical manifestation. Mr. Stuart said the members of the Legislature bitterly complained of the amount of game—venison and grouse of the most delicious quality—which was served them at the taverns in Vandalia; they clamored for bacon—they were starving, they said, "for something civilized." There was plenty of civilized nourishment in Springfield. Wheat was fifty cents a bushel, rye thirty-three; corn and oats were twenty-five, potatoes twenty-five; butter was eight cents a pound, and eggs were eight cents a dozen; pork was two and a half cents a pound.

The town was built on the edge of the

* Ford's "History," p. 94.

MRS. LUCY G. SPEED, MOTHER OF JOSHUA SPEED. (FROM A PAINTING BY JOSEPH BUSH. ABOUT 1834.)

woods, the north side touching the timber, the south encroaching on the prairie. The richness of the soil was seen in the mud of the streets, black as ink, and of an unfathomable depth in time of thaw. There were, of course, no pavements or sidewalks; an attempt at crossings was made by laying down large chunks of wood. The houses were almost all of wood, and were disposed in rectangular blocks. A large square had been left in the middle of the town, in anticipation of future greatness, and there, when Lincoln began his residence, the work of clearing the ground for the new State-house was already going forward. In one of the largest houses looking on the square, at the north-west corner, the county court had its offices, and other rooms in the building were let to lawyers. One of these was occupied by Stuart and Lincoln, for the friendship formed in the Black Hawk war and strengthened at Van-

dalia induced "Major" Stuart to offer a partnership to "Captain" Lincoln.*

Lincoln did not gain any immediate eminence at the bar. His preliminary studies had been cursory and slight, and Stuart was then too much engrossed in politics to pay the unremitting attention to law which that jealous mistress requires. He had been a candidate for Congress the year before, and had been defeated by W. L. May. He was a candidate again in 1838, and was elected over so agile an adversary as Stephen Arnold Douglas. His paramount interest in these canvasses necessarily prevented him from setting to his junior partner the example, which Lincoln so greatly needed, of close and steady devotion to their profession. It was only several years later that Lincoln found with Judge Logan the companionship and inspiration which he required, and began to be really a lawyer. During the first year or two he is

* It is not unworthy of notice that in a country where military titles were conferred with ludicrous profusion and borne with absurd complacency, Lincoln, who had

actually been commissioned, and had served as captain, never used the designation after he laid down his command.

principally remembered in Springfield as an excellent talker, the life and soul of the little gatherings about the county offices, a storyteller of the first rank, a good-natured, friendly fellow whom everybody liked and trusted. He relied more upon his influence with a jury than upon his knowledge of law in the few cases he conducted in court, his acquaintance with human nature being far more extensive than his legal lore.

THE COLLAPSE OF "THE SYSTEM."

LINCOLN was not yet done with Vandalia, its dinners of game, and its political intrigue. The archives of the State were not removed to Springfield until 1839, and Lincoln remained a member of the Legislature by successive reelections from 1834 to 1842. He was called down to Vandalia in the summer of 1837, by a special session of the Legislature. The magnificent schemes of the foregoing winter required some repairing. The banks throughout the United States had suspended specie payments in the spring, and as the State banks in Illinois were the fiscal agents of the railroads and canals, the Governor called upon the law-makers to revise their own work, to legalize the suspension, and bring their improvement system within possible bounds. They acted as might have been expected: complied with the former suggestion, but flatly refused to touch their masterpiece. They had been glorifying their work too energetically to destroy it in its infancy. It was said you could recognize a legislator that year in any crowd by his automatic repetition of the phrase, "Thirteen hundred—fellow-citizens!—and fifty miles of railroad!" There was nothing to be done but go on with the stupendous folly. Loans were effected with surprising and fatal facility, and "before the end of the year, work had begun at many points on the railroads. The whole State was excited to the highest pitch of frenzy and expectation. Money was as plenty as dirt. Industry, instead of being

LINCOLN AND STUART'S LAW-OFFICE, SPRINGFIELD.

stimulated, actually languished. We exported nothing," says Governor Ford, "and everything from abroad was paid for by the borrowed money expended among us." Not only upon the railroads, but on the canal as well, the work was begun on a magnificent scale. Nine millions of dollars were thought to be a mere trifle in view of the colossal sum expected to be realized from the sale of canal lands, three hundred thousand acres of which had been given by the General Government. There were rumors of coming trouble, and of an unhealthy condition of the banks; but it was considered incivism to look too curiously into such matters. One frank patriot, who had been sent as one of a committee to examine the bank at Shawneetown, when asked what he found there, replied with winning candor, "Plenty of good whisky and sugar to sweeten it."*

But a year of baleful experience destroyed a great many illusions, and in the election of 1838 the subject of internal improvements was treated with much more reserve by candidates. The debt of the State, issued at a continually increasing discount, had already attained enormous proportions; the delirium of the last few years was ending, and sensible people began to be greatly disquieted. Nevertheless, Mr. Cyrus Edwards boldly made his canvass for Governor as a supporter of the system of internal improvements, and his opponent, Thomas Carlin, was careful not to

LINCOLN'S INKSTAND.
(FROM THE KEYES LINCOLN MEMORIAL COLLECTION, CHICAGO.)

commit himself strongly on the other side. Carlin was elected, and finding that a majority of the Legislature was still opposed to any steps backward, he made no demonstration against the system at the first session. Lincoln was a member of this body, and, being by that time the unquestioned leader of the Whig minority, was nominated for Speaker, and came within one vote of an election. The Legislature was still stiff-necked and perverse in regard to the system. It refused to modify it in the least, and voted, as if in bravado, another eight hundred thousand dollars to extend it.

But this was the last paroxysm of a fever that was burnt out. The market was glutted with Illinois bonds; one banker and one broker after another, to whose hands they had been recklessly confided in New York and London, failed, or made away with the proceeds of sales. The system had utterly failed; there was nothing to do but repeal it, stop work upon the visionary roads, and endeavor to invent some means of paying the enormous debt. This work taxed the energies of the Legislature in 1839, and for some years after. It was a dismal and disheartening task. Blue Monday had come after these years of intoxication, and a crushing debt rested upon a people who had been deceiving themselves with the fallacy that it would somehow pay itself by acts of the Legislature. Many were the schemes devised for meeting these oppressive obligations without unduly taxing the voters; one of them, not especially wiser than the rest, was contributed by Mr. Lincoln. It provided for the issue of bonds for the payment of the interest due by the State, and for the appropriation of a special portion of State

taxes to meet the obligations thus incurred. He supported his bill in a perfectly characteristic speech, making no effort to evade his share of the responsibility for the crisis, and submitting his views with diffidence to the approval of the Assembly. His plan was not adopted; it was too simple and straightforward, even if it had any other merits, to meet the approval of an assembly intent only upon getting out of immediate embarrassment by means which might save them trouble on the stump hereafter. There was even an undercurrent of sentiment in favor of repudiation. But the payment of the interest for that year was provided for by an ingenious expedient, which shifted upon the Fund Commissioners the responsibility of deciding what portion of the debt was legal, and how much interest was therefore to be paid. Bonds were sold for this purpose at a heavy loss.

This session of the Legislature was enlivened by a singular contest between the Whigs and Democrats in relation to the State banks. Their suspension of specie payments had been legalized up to "the adjournment of the next session of the Legislature." They were not now able to resume, and it was held by the Democrats that if the special session adjourned *sine die* the charter of the banks would be forfeited, a purpose the party was eager to accomplish. The Whigs, who were defending the banks, wished to prevent the adjournment of the

LINCOLN'S BOOKCASE.

MILTON HAY, 1886. (FROM A PHOTOGRAPH BY W. F. TRUESDELL.)

special session until the regular session should begin, during the course of which they expected to renew the lease of life now held under sufferance by the banks—in which, it may be here said, they were finally successful. But on one occasion, being in the minority, and having exhausted every other parliamentary means of opposition and delay, and seeing the vote they dreaded imminent, they tried to defeat it by leaving the house in a body, and, the doors being locked, a number of them, among whom Mr. Lincoln's tall figure was prominent, jumped from the windows of the church where the Legislature was then holding its sessions. "I think," says Mr. Gillespie, who was one of those who performed this feat of acrobatic politics, "Mr. Lincoln always regretted it, as he deprecated everything that savored of the revolutionary."

Two years later the persecuted banks, harried by the demagogues and swindled by the State, fell with a great ruin, and the financial misery of the State was complete. Nothing was left of the brilliant schemes of the historic Legislature of 1836 but a load of debt which crippled for many years the energies of the people, a few miles of embankments which the grass hastened to cover, and a few abutments which stood for years by the sides of

leafy rivers, waiting for the bridges and the trains which were never to come.

During the winter of 1840-1 occurred the first clash of opinion and principle between Mr. Lincoln and his life-long adversary, Mr. Douglas. There are those who can see only envy and jealousy in that strong dislike and disapproval with which Mr. Lincoln always regarded his famous rival, and we regret that one of his biographers has taken this injurious view of the matter. But we think that few men have ever lived who were more free from those degrading passions than Abraham Lincoln, and the personal reprobation with which he always visited the public acts of Douglas arose from his sincere conviction that the man was essentially without fixed political morals. They had met for the first time in 1834 at Vandalia, where Douglas was busy in getting the circuit attorneyship away from John J. Hardin. He held it only long enough to secure a nomination to the Legislature in 1836. He went there to endeavor to have the capital moved to Jacksonville, where he lived, but he gave up the fight for the purpose of having himself appointed Register of the Land Office at Springfield. He held this place as a means of being nominated for Congress the next year; he was nominated and defeated. In 1840 he was engaged in another scheme

WILLIAM HENRY HARRISON, 1841. (FROM A PAINTING BY HENRY INMAN, IN POSSESSION OF BENJAMIN HARRISON.)

to which we will give a moment's attention, which resulted in giving him a seat on the Supreme Bench of the State, which he used merely as a perch from which to get into Congress.

There had been a difference of opinion in Illinois for some years as to whether the Constitution, which made voters of all white male inhabitants of six months' residence, meant to include aliens in that category. As the aliens were nearly all Democrats, that party insisted on their voting, and the Whigs objected. The best lawyers in the State were Whigs, and so it happened that most of the judges were of that complexion. A case was made up for decision and decided adversely to the aliens, who appealed it to the Supreme Court. This case was to come on at the June term in 1840, and the Democratic counsel, chief among whom was Mr. Douglas, were in some anxiety, as an unfavorable decision would lose them about ten thousand alien votes in the Presidential election in November. In this conjuncture one Judge Smith, of the Supreme Court, an ardent Democrat, willing to enhance his value in his party, communicated to Mr. Douglas two important facts: first, that a majority of the court would certainly decide against the aliens; and, secondly, that there was a slight imperfection in the record by

which counsel might throw the case over to the December term, and save the alien vote for Van Buren and the Democratic ticket. This was done, and when the Legislature came together with its large Democratic majority, Mr. Douglas handed in a bill "reforming" the Judiciary — for they had learned that serviceable word already. The circuit judges were turned out of office, and five new judges were added to the Supreme Court, who were to perform circuit duty also. It is needless to say that Judge Douglas was one of these, and he had contrived also in the course of the discussion to disgrace his friend Smith so thoroughly by quoting his treacherous communication of matters which took place within the court, that Smith was no longer a possible rival for political honors.

It was useless for the Whigs to try to prevent this degradation of the bench. There was no resource but a protest, and here again Lincoln uttered the voice of the conscience of the party. He was joined on this occasion by Colonel E. D. Baker* and some others, who protested against the act because

"1st. It violates the principles of free government by subjecting the Judiciary to the Legislature.

* The same who was afterwards senator from Oregon, killed at Ball's Bluff.

"2d. It is a fatal blow at the independence of the judges and the constitutional term of their offices.

"3d. It is a measure not asked for or wished for by the people.

"4th. It will greatly increase the expense of our courts or else greatly diminish their utility.

"5th. It will give our courts a political and partisan character, thereby impairing public confidence in their decisions.

"6th. It will impair our standing with other States and the world.

"7th. It is a party measure for party purposes from which no practical good to the people can possibly arise, but which may be the source of immeasurable evils.

"The undersigned are well aware that this protest will be altogether unavailing with the majority of this body. The blow has already fallen; and we are compelled to stand by, the mournful spectators of the ruin it will cause."

It will be easy to ridicule this indignant protest as the angry outcry of beaten partisans; but fortunately we have evidence which cannot be gainsaid of the justice of its sentiments and the wisdom of its predictions. Governor Ford,* himself a Democratic leader as able as he was honest, writing seven years after these events, condemns them as wrong and impolitic, and adds, "Ever since this reforming measure the Judiciary has been unpopular with the Democratic majorities. Many and most of the judges have had great personal popularity — so much so as to create complaint of so many of them being elected or appointed to other offices. But the Bench itself has been the subject of bitter attacks by every Legislature since." It had been soiled by unclean contact and could not be respected as before.

LAW IN SPRINGFIELD.

DURING all the years of his service in the Legislature, Lincoln was practicing law in Springfield in the dingy little office at the corner of the square. A youth named Milton Hay, who afterwards became one of the foremost lawyers of the State, had become acquainted with Lin-

* Ford's "History," p. 221.

coln at the County Clerk's office and proposed to study law with him. He was at once accepted as a pupil, and as his days were otherwise employed he gave his nights to reading, and as his vigils were apt to be prolonged he furnished a bedroom adjoining the office, where Lincoln often passed the night with him. Mr. Hay gives this interesting account of the practice of law in those days:

"In forming our ideas of Lincoln's growth and development as a lawyer, we must remember that in those early days litigation was very simple as compared with that of modern times. Population was sparse and society scarcely organized, land was plentiful and employment abundant. There was an utter absence of the abstruse questions and complications which now beset the law. There was no need of that close and searching study into principles and precedents which keeps the modern law-student buried in his office. On the contrary, the very character of this simple litigation drew the lawyer into the street and neighborhood, and into close and active intercourse with all classes of his fellow-men. The suits consisted of actions of tort and assumpsit. If a man had an uncollectible debt, the current phrase was, 'I'll take it out of his hide.' This would bring on an action for assault and battery. The free comments of the neighbors on the fracas or the character of the parties would be productive of slander suits. A man would for his convenience lay down an irascible neighbor's fence, and indolently forget to put it up again, and an action of trespass would grow out of it. The suit would lead to a free fight, and sometimes furnish the bloody incidents for a murder trial.

"Occupied with this class of business, the half-legal, half-political lawyers were never found plodding in their offices. In that case they would have waited long for the recognition of their talents or a demand for their services. Out of this characteristic of the times also grew the street discussions I have adverted to. There was scarcely a day or hour when a knot of men might not have been seen near the door of some prominent store, or about the steps of the court-house, eagerly discussing a current political topic — not as a question of news, for news was not then received quickly or frequently, as it is now, but rather for the sake of debate; and the men from the country, the pioneers and farmers, always gathered eagerly about these groups and listened with open-mouthed interest, and frequently manifested their approval or dissent in strong words, and carried away to their neighborhoods a report of the debaters' wit and skill. It was in these street talks that the rising and aspiring young lawyer found his daily and hourly forum. Often by good luck or prudence he had the field entirely to himself, and so escaped the dangers and discouragements of a decisive conflict with a trained antagonist."

Mr. Stuart was either in Congress or engaged in actively canvassing his district a great part of the time that his partnership with Lincoln continued, so that the young lawyer was thrown a good deal on his own

resources for occupation. There was not enough business to fill up all his hours, and he was not at that time a close student, so that he soon became as famous for his racy talk and good-fellowship at all the usual lounging-places in Springfield as he had ever been in New Salem. Mr. Hay says, speaking of the youths who made the County Clerk's office their place of rendezvous, "It was always a great treat when Lincoln got amongst us. We were sure to have some of those stories for which he already had a reputation, and there was this peculiarity about them, that they were not only entertaining in themselves, but always singularly illustrative of some point he wanted to make." After Mr. Hay entered his office, and was busily engaged with his briefs and declarations, the course of their labors was often broken by the older man's wise and witty digressions. Once an interruption occurred which affords an odd illustration of the character of discussion then prevalent. We will give it in Mr. Hay's words :

"The custom of public political debate, while it was sharp and acrimonious, also engendered a spirit of equality and fairness. Every political meeting was a free fight open to every one who had talent and spirit, no matter to which party the speaker belonged. These discussions used often to be held in the court-room, just under our office, and through a trap-door, made there when the building was used for a store-house,

we could hear everything that was said in the hall below. One night there was a discussion in which Baker took part. He was a fiery fellow, and when his impulsiveness was let loose among the rough element that composed his audience, there was a fair prospect of trouble at any moment. Lincoln was lying on the bed, apparently paying no attention to what was going on. Lamborn was talking, and we suddenly heard Baker interrupting him with a sharp remark, then a rustling and uproar. Lincoln jumped from the bed and down the trap, lighting on the platform between Baker and the audience, and quieted the tumult as much by the surprise of his sudden apparition as by his good-natured and reasonable words."

He was often unfaithful to the Quaker traditions in those days of his youth. Those who witnessed his wonderful forbearance and self-restraint in later manhood would find it difficult to believe how promptly and with what pleasure he used to resort to measures of repression against a bully or brawler. On the day of election in 1840, word came to him that one Radford, a Democratic contractor, had taken possession of one of the polling-places with his workmen, and was preventing the Whigs from voting. Lincoln started off at a gait which showed his interest in the matter in hand. He went up to Radford and persuaded him to leave the polls without a moment's delay. One of his candid remarks is remembered and recorded : " Radford ! you'll spoil and blow, if you live much longer." Radford's prudence prevented an actual collision, which, it must be confessed, Lincoln regretted. He told his friend Speed he wanted Radford to show fight so that he might " knock him down and leave him kicking."*

Early in the year 1840 it seemed possible that the Whigs might elect General Harrison to the Presidency, and this hope lent added energy to the party even in the States where the majority was so strongly against them as in Illinois. Lincoln was nominated for Presidential Elector and threw himself with ardor into the canvass, traversing a great part of the State and speaking with remarkable effect. Only one of the speeches he made during the year has been preserved entire : this was an address delivered in Springfield as one of a series — a sort of oratorical tournament participated in by Douglas, Calhoun, Lamborn and Thomas, on the part of the Democrats, and Logan, Baker, Browning, and Lincoln on the part of the Whigs. The discussion began with great enthusiasm and with crowded houses, but by the time it came to Lincoln's duty to close the debate the fickle public had tired of the intellectual jousts, and he spoke to a comparatively thin house. But his speech was considered the best of the series, and there was such a demand for it that he wrote it out, and it was printed and circulated in the

* Lamon, p. 230.

spring as a campaign document. It was a remarkable speech in many respects — and in none more than in this, that it represented the highest expression of what might be called his “first manner.” It was the most important and the last speech of its class which he ever delivered — not destitute of sound and close reasoning, yet filled with boisterous fun and florid rhetoric. It was, in short, a rattling stump speech of the sort then universally popular in the West, and which is still considered a very high grade of eloquence in the South. But it is of no kindred with his Inaugural addresses, and resembles the Gettysburg speech no more than “The Comedy of Errors” resembles “Hamlet.” One or two extracts will give some idea of its humorous satire and its lurid fervor. Attacking the corruptions and defalcations of the administration party he said, “Mr. Lamborn insists that the difference between the Van Buren party and the Whigs is that, although the former sometimes err in practice they are always correct in principle, whereas the latter are wrong in principle; and the better to impress this proposition he uses a figurative expression in these words,

‘The Democrats are vulnerable in the heel, but they are sound in the heart and head.’ The first branch of the figure — that is, the Democrats are vulnerable in the heel — I admit is not merely figuratively but literally true. Who that looks but for a moment at their Swartwouts, their Prices, their Harringtons, and their hundreds of others scampering away with the public money to Texas, to Europe, and to every spot of the earth where a villain may hope to find refuge from justice, can at all doubt that they are most distressingly affected in their heels with a species of running itch. It seems that this malady of their heels operates on the sound-headed and honest-hearted creatures very much as the cork leg in the comic song did on its owner, which, when he once got started on it, the more he tried to stop it the more it would run away. At the hazard of wearing this point threadbare, I will relate an anecdote which seems to be too strikingly in point to be omitted. A witty Irish soldier who was always boasting of his bravery when no danger was near, but who invariably retreated without orders at the first charge of the engagement, being asked by his captain why he did so, replied, ‘Captain, I have as brave a heart as Julius Cæsar ever had, but somehow or other

whenever danger approaches, my cowardly legs will run away with it.’ So with Mr. Lamborn’s party — they take the public money into their hands for the most laudable purpose that wise heads and honest hearts can dictate; but before they can possibly get it out again, their rascally vulnerable heels will run away with them.”

The speech concludes with these swelling words :

“Mr. Lamborn refers to the late elections in the States, and from their results confidently predicts every State in the Union will vote for Mr. Van Buren at the next Presidential election. Address that argument to cowards and knaves: with the free and the brave it will affect nothing. It may be true; if it must, let it. Many free countries have lost their liberty, and ours may lose hers; but if she shall, be it my proudest plume, not that I was the last to desert, but that I never deserted her. I know that the great volcano at Washington, aroused and directed by the evil spirit that reigns there, is belching forth the lava of political corruption in a current broad and deep, which is sweeping with frightful velocity over the whole length and breadth of the land, bidding fair to leave unscathed no green spot or living thing; while on its bosom are riding, like demons on the wave of Hell, theimps of the Evil Spirit, and fiendishly taunting all those who dare to resist its destroying course with the hopelessness of

COVER OF SONG BOOK USED IN HARRISON CAMPAIGN.
(IN POSSESSION OF BENJAMIN HARRISON.)

their efforts; and knowing this, I cannot deny that all may be swept away. Broken by it I, too, may be; bow to it, I never will. The probability that we may fall in the struggle ought not to deter us from the support of a cause we believe to be just. It shall not deter me. If ever I feel the soul within me elevate and expand to those dimensions not wholly unworthy of its almighty architect, it is when I contemplate the cause of my country, deserted by all the world beside, and I standing up boldly alone, hurling defiance at her victorious oppressors. Here, without contemplating consequences, before Heaven, and in face of the world, I swear eternal fealty to the just cause, as I deem it, of the land of my life, my liberty, and my love. And who that thinks with me will not fearlessly adopt that oath that I take? Let none falter who thinks he is right, and we may succeed. But if after all we should fail, be it so. We still shall have the proud consolation of saying to our consciences, and to the departed shade of our country's freedom, that the cause approved of our judgment, and adored of our hearts, in disaster, in chains, in torture, in death, we never faltered in defending."

These perfervid and musical metaphors of devotion and defiance have often been quoted as Mr. Lincoln's heroic challenge to the slave power, and Bishop Simpson gave them that lofty significance in his funeral oration. But they were simply the utterances of a young and ardent Whig, earnestly advocating the election of "old Tippecanoe" and not unwilling, while doing this, to show the people of the capital a specimen of his eloquence. The whole campaign was carried on in a tone somewhat shrill. The Whigs were recovering from the numbness into which they had fallen during the time of Jackson's imperious predominance, and in the new prospect of success they felt all the excitement of prosperous rebels. The taunts of the party in power, when Harrison's nomination was first mentioned, their sneers at "hard cider" and "log-cabins," had been dexterously adopted as the slogan of the opposition, and gave rise to the distinguishing features of that extraordinary campaign. Log-cabins were built in every Western county, tuns of hard cider were filled and emptied at all the Whig mass meetings; and as the canvass gained momentum and vehemence, a curious kind of music added its inspiration to the cause; and after the Maine election was over, with its augury of triumph, every Whig who was able to sing, or even to make a joyful noise, was roaring the inquiry, "Oh, have you heard how old Maine went?" and the profane but powerfully accented response, "She went, hell-bent, for Governor Kent, and Tippecanoe, and Tyler too."

It was one of the busiest and most enjoyable seasons of Lincoln's life. He had grown by this time thoroughly at home in political controversy, and he had the pleasure of frequently meeting Mr. Douglas in rough-and-tumble debate in various towns of the State as they followed Judge Treat on his circuit.

If we may trust the willing testimony of his old associates, Lincoln had no difficulty in holding his own against his adroit antagonist, and it was even thought that the recollection of his ill success in these encounters was not without its influence in inducing Douglas and his followers, defeated in the nation, though victorious in the State, to wreak their vengeance on the Illinois Supreme Court.

In Lincoln's letters to Major Stuart,* then in Washington, we see how strongly the subject of politics overshadows all others in his mind. Under date of November 14, 1839, he writes:

"I have been to the Secretary's office within the last hour, and find things precisely as you left them; no new arrivals of returns on either side. Douglas has not been here since you left. A report is in circulation here now that he has abandoned the idea of going to Washington; but the report does not come in very authentic form so far as I can learn. Though, speaking of authenticity, you know that if we had heard Douglas say that he had abandoned the contest, it would not be very authentic. There is no news here. Noah,† I still think, will be elected very easily. I am afraid of our race for representative. Dr. Knapp has become a candidate; and I fear the few votes he will get will be taken from us. Also some one has been tampering with old squire Wyckoff, and induced him to send in his name to be announced as a candidate. Francis refused to announce him without seeing him, and now I suppose there is to be a fuss about it. I have been so busy that I have not seen Mrs. Stuart since you left, though I understand she wrote you by to-day's mail, which will inform you more about her than I could. The very moment a speaker is elected, write me who he is. Your friend, as ever."

Again he writes, on New Year's Day, 1840, a letter curiously destitute of any festal suggestions:

"There is a considerable disposition on the part of both parties in the Legislature to reinstate the law bringing on the Congressional elections next summer. What motive for this the Locos have, I cannot tell. The Whigs say that the canal and other public works will stop, and consequently we shall then be clear of the foreign votes, whereas by another year they may be brought in again. The Whigs of our district say that everything is in favor of holding the election next summer, except the fact of your absence; and several of them have requested me to ask your opinion on the matter. Write me immediately what you think of it."

"On the other side of this sheet I send you a copy of my Land Resolutions, which passed both branches of our Legislature last winter. Will you show them to Mr. Calhoun, informing him of the fact of their passage through our Legislature? Mr. Calhoun suggested a similar proposition last winter; and perhaps if he finds himself backed by one of the States he may be induced to take it up again."

After the session opened, January 20th, he wrote to Mr. Stuart, accurately outlining the work of the winter:

"The following is my guess at what will be done. The Internal Improvement System will be put down in a lump without benefit of clergy. The Bank will be resuscitated with some trifling modifications."

* Copied from the MS. in Major Stuart's possession.

† Noah Matheny, County Clerk.

State affairs have evidently lost their interest, however, and his soul is in arms for the wider fray. "Be sure to send me as many Lives of Harrison as you can spare. Be very sure to send me the Senate Journal of New York for September, 1814,"—he had seen in a newspaper a charge of disloyalty made against Mr. Van Buren during the war with Great Britain, but, as usual, wanted to be sure of his facts,—“and in general,” he adds, “send me everything you think will be a good war-club. The nomination of Harrison takes first-rate. You know I am never sanguine; but I believe we will carry the State. The chance for doing so appears to me twenty-five per cent. better than it did for you to beat Douglas. A great many of the grocery sort of Van Buren men are out for Harrison. Our Irish blacksmith Gregory is for Harrison. You have heard that the Whigs and Locos had a political discussion shortly after the meeting of the Legislature. Well, I made a big speech [the one from which we have just quoted] which is in progress of printing in pamphlet form. To enlighten you and the rest of the world, I shall send you a copy when it is finished.”

The sanguine mood continues in his next letter, March 1st:

“I have never seen the prospects of our party so bright in these parts as they are now. We shall carry this county by a larger majority than we did in 1836 when you ran against May. I do not think my prospects individually are very flattering, for I think it probable I shall not be permitted to be a candidate; but the party ticket will succeed triumphantly. Subscriptions to the ‘Old Soldier’ pour in without abatement. This morning I took from the post-office a letter from Dubois, inclosing the names of sixty subscribers, and on carrying it to Francis [Simeon Francis, editor of the ‘Sangamon Journal’] I found he had received one hundred and forty more from other quarters by the same day’s mail. Yesterday Douglas, having chosen to consider himself insulted by something in the ‘Journal,’ undertook to cane Francis in the street. Francis caught him by the hair and jammed him back against a market-cart, where the matter ended by Francis being pulled away from him. The whole affair was so ludicrous that Francis and everybody else, Douglas excepted, have been laughing about it ever since.”

Douglas seems to have had a great propensity to such rencontres, of which the issue was ordinarily his complete discomfiture, as he had the untoward habit of attacking much bigger and stronger men than himself. He weighed at that time little, if anything, over a hundred pounds, yet his heart was so valiant that he made nothing of assaulting men of ponderous flesh like Francis, or of great height and strength like Stuart. He sought a quarrel with the latter, during their canvass in 1838, in a grocery, with the usual result. A bystander who remembers the incident says that Stuart “jest mopped the floor with him.”

In the same letter Mr. Lincoln gives a long list of names to which he wants documents to be sent. It shows a remarkable personal acquaintance with the minutest needs of the canvass: this one is a doubtful Whig; that one is an inquiring Democrat; that other a zealous young fellow who would be pleased by the attention; three brothers are mentioned who “fell out with us about Early and are doubtful now”; and finally he tells Stuart that Joe Smith is an admirer of his, and that a few documents had better be mailed to the Mormons, and he must be sure, the next time he writes, to send Evan Butler his compliments.

It would be strange, indeed, if such a politician as this were slighted by his constituents, and in his next letter we find how groundless were his forebodings in that direction. The convention had been held; the rural delegates took all the nominations away from Springfield except two, Baker for the Senate, and Lincoln for the House of Representatives. “Ninian,” he says, meaning Ninian W. Edwards, “was very much hurt at not being nominated, but he has become tolerably well reconciled. I was much, very much, wounded myself, at his being left out. The fact is, the country delegates made the nominations as they pleased, and they *pleased* to make them all from the country, except Baker and me, whom they supposed necessary to make stump speeches. Old Colonel Elkin is nominated for Sheriff—that’s right.”

Harrison was elected in November, and the great preoccupation of most of the Whigs was, of course, the distribution of the offices which they felt belonged to them as the spoils of battle. This demoralizing doctrine had been promulgated by Jackson, and acted upon for so many years that it was too much to expect of human nature that the Whigs should not adopt it, partially at least, when their turn came. But we are left in no doubt as to the way in which Lincoln regarded the unseemly scramble. It is probable that he was asked to express his preference among applicants, and he writes under date of December 17:

“This affair of appointments to office is very annoying—more so to you than to me doubtless. I am, as you know, opposed to removals to make places for our friends. Bearing this in mind, I express my preference in a few cases as follows: for Marshal, first, John Dawson, second, B. F. Edwards; for postmaster here, Dr. Henry; at Carlinville, Joseph C. Howell.”

The mention of this last post-office rouses his righteous indignation, and he calls for justice upon a wrong-doer.

“There is no question of the propriety of removing the postmaster at Carlinville. I have been told by so

many different persons as to preclude all doubt of its truth, that he boldly refused to deliver from his office during the canvass all documents franked by Whig members of Congress."

Once more, on the 23d of January, 1841, he addresses a letter to Mr. Stuart, which closes the correspondence, and which affords a glimpse of that strange condition of melancholia into whose dark shadow he was then entering, and which lasted, with only occasional intervals of healthy cheerfulness, to the time of his marriage. We give this remarkable letter entire, from the manuscript submitted to us by the late John T. Stuart:

"DEAR STUART: Yours of the 3d instant is received, and I proceed to answer it as well as I can, though from the deplorable state of my mind at this time I fear I shall give you but little satisfaction. About the matter of the Congressional election, I can only tell you that there is a bill now before the Senate adopting the general ticket system; but whether the party have fully determined on its adoption is yet uncertain. There is no sign of opposition to you among our friends, and none that I can learn among our enemies; though of course there will be if the general ticket be adopted. The Chicago 'American,' Peoria 'Register,' and Sangamon 'Journal' have already hoisted your flag upon their own responsibility; and the other Whig papers of the district are expected to follow immediately. On last evening there was a meeting of our friends at Butler's, and I submitted the question to them and found them unanimously in favor of having you announced as a candidate. A few of us this morning, however, concluded that as you were already being announced in the papers, we would delay announcing you, as by your authority, for a week or two. We thought that to appear too keen about it might spur our opponents on about their general ticket project. Upon the whole I think I may say with certainty that your reelection is sure, if it be in the power of the Whigs to make it so.

"For not giving you a general summary of news, you *must* pardon me; it is not in my power to do so. I am now the most miserable man living. If what I feel were equally distributed to the whole human family, there would not be one cheerful face on earth. Whether I shall ever be better I cannot tell; I awfully forebode I shall not. To remain as I am is impossible; I must die or be better, it appears to me. The matter you speak of on my account you may attend to as you say, unless you shall hear of my condition forbidding it. I say this because I fear I shall be unable to attend to any business here, and a change of scene might help me. If I could be myself, I would rather remain at home with Judge Logan. I can write no more. Your friend as ever.

(Signed) "A. LINCOLN."

LINCOLN'S MARRIAGE.

THE foregoing letter brings us to the consideration of a remarkable passage in Lin-

coln's life. It has been the cause of much profane and idle discussion among those who were constitutionally incapacitated from appreciating ideal sufferings, and we would be tempted to refrain from adding a word to what has already been said if it were possible to omit all reference to an experience so important in the development of his character.

In the year 1840 he became engaged to be married to Miss Mary Todd, of Lexington, Kentucky, a young lady of good education and excellent connections, who was visiting her sister, Mrs. Ninian W. Edwards, at Springfield.* The engagement was not in all respects a happy one, as both parties doubted their mutual compatibility, and a heart so affectionate and a conscience so sensitive as Lincoln's found material for exquisite self-torment in these conditions. His affection for his betrothed, which he thought was not strong enough to make happiness with her secure; his doubts, which yet were not convincing enough to induce him to break off all relations with her; his sense of honor, which was wounded in his own eyes by his own act; his sense of duty, which condemned him in one course and did not sustain him in the opposite one—all combined to make him profoundly and passionately miserable. To his friends and acquaintances, who were unacquainted with such finely wrought and even fantastic sorrows, his trouble seemed so exaggerated that they could only account for it on the ground of insanity. But there is no necessity of accepting this crude hypothesis; the coolest and most judicious of his friends deny that his depression ever went to such an extremity. Orville H. Browning, who was constantly in his company, says that his worst attack lasted only about a week; that during this time he was incoherent and distraught; but that in the course of a few days it all passed off, leaving no trace whatever. "I think," says Mr. Browning, "it was only an intensification of his constitutional melancholy; his trials and embarrassments pressed him down to a lower point than usual."

This taint of constitutional sadness was not peculiar to Lincoln; it may be said to have been endemic among the early settlers of the West. It had its origin partly in the circumstances of their lives, the severe and dismal loneliness in which their struggle for existence for the most part went on. Their summers

* Mrs. Lincoln was the daughter of the Hon. Robert S. Todd of Kentucky. Her great-uncle, John Todd, accompanied General George Rogers Clark to Illinois, and was present at the capture of Kaskaskia and Vincennes. In December, 1778, he was appointed by Patrick Henry, Governor of Virginia, to be lieutenant of the county of Illinois, then a part of Virginia. He was killed at the battle of Blue Licks, in 1782. His

brother Levi, Mrs. Lincoln's grandfather, was also at that battle, and was one of the few survivors of it.

Colonel John Todd was one of the original proprietors of the town of Lexington, Ky. While encamped on the site of the present city, he heard of the opening battle of the Revolution, and named his infant settlement in its honor.—Arnold's "Life of Lincoln," p. 68.

were passed in the solitude of the woods; in the winters they were often snowed up for months in the more desolate isolation of their own poor cabins. Their subjects of conversation were limited, their range of thoughts and ideas narrow and barren. There was as little cheerfulness in their manners as there was incentive to it in their lives. They occasionally burst out into wild frolic, which easily assumed the form of comic outrage, but of the sustained cheerfulness of social civilized life they knew very little. One of the few pioneers who have written their observations of their own people, Mr. John McConnell,* says, "They are at the best not a cheerful race; though they sometimes join in festivities, it is but seldom, and the wildness of their dissipation is too often in proportion to its infrequency. There is none of that serene contentment which distinguishes the tillers of the ground in other lands. . . . Acquainted with the character [of the pioneer,] you do not expect him to smile much, but now and then he laughs."

Besides this generic tendency to melancholy, very many of the pioneers were subject in early life to malarial influences, the effect of which remained with them all their days. Hewing out their plantations in the primeval woods amid the undisturbed shadow of centuries, breaking a soil thick with ages of vegetable decomposition, sleeping in half-faced camps, where the heavy air of the rank woods was in their lungs all night, or in the fouler atmosphere of overcrowded cabins, they were especially subject to miasmatic fevers. Many died, and of those who survived a great number, after they had outgrown the more immediate manifestations of disease, retained in nervous disorders of all kinds the distressing traces of the maladies which afflicted their childhood. In the early life of Lincoln these unwholesome physical conditions were especially prevalent. The country about Pigeon Creek was literally devastated by the terrible malady called "milk-sickness," which carried away his mother and half her family. His father left his home in Sangamon County also, on account of the frequency and severity of the attacks of fever and ague which were suffered there; and, in general, Abraham was exposed through all the earlier part of his life to those malarial influences which made, during the first half of this century, the various preparations of Peruvian bark a part of the daily food of the people of Indiana and Illinois. In many instances this miasmatic poison did not destroy the strength or materially shorten the lives of those who absorbed it in their youth; but the effects remained in periodical attacks of gloom and depression of

spirits which would seem incomprehensible to thoroughly healthy organizations, and which gradually lessened in middle life, often to disappear entirely in old age.

Upon a temperament thus predisposed to look at things in their darker aspect, it might naturally be expected that a love-affair which was not perfectly happy would be productive of great misery. But Lincoln seemed especially chosen to the keenest suffering in such a conjuncture. The pioneer, as a rule, was comparatively free from any troubles of the imagination. To quote Mr. McConnell† again: "There was no romance in his [the pioneer's] composition. He had no dreaminess; meditation was no part of his mental habit; a poetical fancy would, in him, have been an indication of insanity. If he reclined at the foot of a tree, on a still summer day, it was to sleep; if he gazed out over the waving prairie, it was to search for the column of smoke which told of his enemies' approach; if he turned his eyes towards the blue heaven, it was to prognosticate to-morrow's rain or sunshine. If he bent his gaze towards the green earth, it was to look for 'Indian sign' or buffalo trail. His wife was only a helpmate; he never thought of making a divinity of her." But Lincoln could never have claimed this happy immunity from ideal trials. His published speeches show how much the poet in him was constantly kept in check; and at this time of his life his imagination was sufficiently alert to inflict upon him the sharpest anguish. His reverence for women was so deep and tender that he thought an injury to one of them was a sin too heinous to be expiated. No Hamlet, dreaming amid the turrets of Elsinore, no Sidney creating a chivalrous Arcadia, was fuller of mystic and shadowy fancies of the worth and dignity of woman than this backwoods politician. Few men ever lived more sensitively and delicately tender towards the sex.

Besides his step-mother, who was a plain, God-fearing woman, he had not known many others until he came to live in New Salem. There he had made the acquaintance of the best people the settlement contained, and among them had become much attached to a young lady named Ann Rutledge, the daughter of one of the proprietors of the place. She died in her girlhood, and though there does not seem to have been any engagement between them, he was profoundly affected by her death. But the next year a young lady from Kentucky appeared in the village, to whom he paid such attentions as in his opinion fully committed him as a suitor for her hand. He admired her, and she seems to have merited the admiration of all the manhood

* "Western Characters," p. 134.

† "Western Characters," p. 126.

there was in New Salem. She was handsome and intelligent and of an admirable temper and disposition. While they were together he was constant in his attentions, and when he was at Vandalia or at Springfield, he continued his assiduities in some of the most singular love-letters ever written. They are filled mostly with remarks about current politics, and with arguments going to show that she had better

grotesquely comic account of the whole affair to a lady with whom and her husband he had contracted an intimate friendship at Vandalia. This letter has been published and severely criticised as showing a shocking lack of gentleman-like feeling. But those who take this view forget that he was writing to an intimate friend of a matter which had greatly occupied his own mind for a year; that

he mentioned no names, and that he threw such an air of humorous unreality about the whole story that the lady who received it never dreamed that it recorded an actual occurrence until twenty-five years afterwards, when, having been asked to furnish it to a biographer, she was warned against doing so by the President himself, who said there was too much truth in it for print. The only significance the episode possesses is in showing this almost abnormal development of conscience in the young man who was perfectly ready to enter into a marriage which he dreaded simply because he thought he had given a young lady reason to think that he had such intentions. While we admit that this would have been an irremediable error, we cannot but wonder at the nobleness of the character to which it was possible.

In this vastly more serious matter, which was, we may say at once, the crucial ordeal of his life, the same invincible truthfulness, the same innate goodness, the same horror

not marry him! At the same time he clearly intimates that he is at her disposition if she is so inclined. At last, feeling that his honor and duty were involved, he made a direct proposal to her, and received an equally direct, kind, and courteous refusal. Not knowing but that this indicated merely a magnanimous desire to give him a chance for escape, he persisted in his offer, and she in her refusal. When the matter had ended in this perfectly satisfactory manner to all parties, he sat down and wrote, by way of epilogue to the play, a

of doing a wrong, are combined with an exquisite sensibility and a capacity for suffering which mark him as a man "picked out among ten thousand." His habit of relentless self-searching reveals to him a state of feeling which strikes him with dismay; his simple and inflexible veracity communicates his trouble and his misery to the woman whom he loves; his freedom, when he has gained it, yields him nothing but an agony of remorse and humiliation. He could not shake off his pain, like men of cooler heads and shallower hearts. It

MARRIAGE CERTIFICATE OF ABRAHAM LINCOLN.
(IN POSSESSION OF KEYES LINCOLN MEMORIAL COLLECTION, CHICAGO.)

*For Mrs. Lucy G. Speed, from whose pious hand I accepted the present of an Oxford Bible twenty years ago.
Washington, D.C. October 5, 1861
A. Lincoln*

PHOTOGRAPH SENT TO MRS. LUCY G. SPEED. (IN POSSESSION OF J. B. SPEED.)

took fast hold of him and dragged him into awful depths of darkness and torture. The letter to Stuart, which we have given, shows him emerging from the blackest period of that time of gloom. Immediately after this, he accompanied his close friend and confidant, Joshua F. Speed, to Kentucky, where, in a way so singular that no writer of fiction would dare to employ the incident, he became almost cured of his melancholy, and came back to Illinois and his work again.

Mr. Speed was a Kentuckian, carrying on a general mercantile business in Springfield—a brother of the distinguished lawyer, James Speed, of Louisville, who afterwards became Attorney-General of the United States. He was one of those men who seem to have to a greater extent than others the genius of friendship, the Pythias, the Pylades, the Horatios of the world. It is hardly too much to say that he was the only—as he was certainly the last—intimate friend that Lincoln ever had. He was his closest companion in Springfield, and in the evil days when the letter to Stuart was written he took him with brotherly love and authority under his special care. He closed up his affairs in Springfield, and went

with Lincoln to Kentucky, and, introducing him to his own cordial and hospitable family circle, strove to soothe his perturbed spirit by every means which unaffected friendliness could suggest. That Lincoln found much comfort and edification in that genial companionship is shown by the fact that after he became President he sent to Mr. Speed's mother a photograph of himself, inscribed, "For Mrs. Lucy G. Speed, from whose pious hand I accepted the present of an Oxford Bible twenty years ago." But the principal means by which the current of his thoughts was changed was never dreamed of by himself or by his friend when they left Illinois. During this visit Speed himself fell in love, and became engaged to be married; and either by a singular chance or because the maladies of the soul may be propagated by constant association, the feeling of despairing melancholy, which he had found so morbid and so distressing an affliction in another, took possession of himself, and threw him into the same slough of despondency from which he had been laboring to rescue Lincoln. Between friends so intimate there were no concealments, and from the moment Lincoln found his services as

nurse and consoler needed, the violence of his own sorrow seemed to diminish. The two young men were in Springfield together in the autumn, and Lincoln seems by that time to have laid aside his own peculiar besetments, in order to minister to his friend. They knew the inmost thoughts of each other's hearts and each relied upon the honesty and loyalty of the other to an extent rare among men. When Speed returned to Kentucky, to a happiness which awaited him there, so bright that it dazzled and blinded his moral vision, Lincoln continued his counsels and encouragements in letters which are remarkable for their tenderness and delicacy of thought and expression. Like another poet, he looked into his own heart and wrote. His own deeper nature had suffered from these same fantastic sorrows and terrors; of his own grief he made a medicine for his comrade.

While Speed was still with him, he wrote a long letter, which he put into his hands at parting, full of wise and affectionate reasonings, to be read when he should feel the need of it. He predicts for him a period of nervous depression — first, because he will be “exposed to bad weather on his journey, and, secondly, because of the absence of all business and conversation of friends which might divert his mind and give it occasional rest from the intensity of thought which will sometimes wear the sweetest idea threadbare, and turn it to the bitterness of death.” The third cause, he says, “is the rapid and near approach of that crisis on which all your thoughts and feelings concentrate.” If in spite of all these circumstances he should escape without a “twinge of the soul,” his friend will be most happily

GOV. NINIAN EDWARDS (ABOUT 1822).
FROM AN ENGRAVING BY H. B. HALL & SONS.

deceived; but, he continues, “if you shall, as I expect you will at some time, be agonized and distressed, let me, who have some reason to speak with judgment on such a subject, beseech you to ascribe it to the causes I have mentioned, and not to some false and ruinous suggestion of the Devil.” This forms the prelude to an ingenious and affectionate argument in which he labors to convince Speed of the loveliness of his betrothed and of the integrity of his own heart; a strange task, one would say, to undertake in behalf of a young and ardent lover. But the two men understood each other, and the service thus rendered was gratefully received and remembered by Speed all his life. Lincoln wrote again on the 3d of February, 1842, congratulating Speed upon a recent severe illness of his destined bride, for the reason that “your present distress and anxiety about her health must forever banish those horrid doubts which you feel as to the truth of your affection for her.” As the period of Speed's marriage drew near, Lincoln's letters betray the most intense anxiety. He cannot wait to hear the news from his friend, but writes to him about the time of the wedding, admitting that he is writing in the dark, that words from a bachelor may be worthless to a Benedick, but still unable to keep silence. He hopes he is happy with his wife, “but should I be mistaken in this, should excessive pleasure still be accompanied with a painful counterpart at times, still let me urge you, as I have ever done, to remember in the

REV. CHARLES DRESSER, WHO MARRIED ABRAHAM LINCOLN
AND MARY TODD. (FROM A DAGUERRETYPE.)

depth and even agony of despondency, that very shortly you are to feel well again." Further on he says, "If you went through the ceremony calmly, or even with sufficient composure not to excite alarm in any present, you are safe beyond question," seeking by every device of subtle affection to lift up the heart of his friend.

With a solicitude apparently greater than that of the nervous bridegroom, he awaited the announcement of the marriage, and when it

improved at the very time I had so much fancied you would have grown worse. You say that something indescribably horrible and alarming still haunts you. You will not say that three months from now, I will venture." The letter goes on in the same train of sympathetic cheer, but there is one phrase which strikes the keynote of all lives whose ideals are too high for fulfillment: "It is the peculiar misfortune of both you and me to dream dreams of Elysium far exceeding all that any-

HOUSE IN WHICH LINCOLN WAS MARRIED, THEN OWNED BY NINIAN W. EDWARDS, NOW OCCUPIED AS ST. AGATHA'S SCHOOL.

came he wrote (February 25th), "I opened the letter with intense anxiety and trepidation; so much that, although it turned out better than I expected, I have hardly yet, at the distance of ten hours, become calm. I tell you, Speed, our forebodings, for which you and I are peculiar, are all the worst sort of nonsense. I fancied from the time I received your letter of Saturday that the one of Wednesday was never to come, and yet it did come, and, what is more, it is perfectly clear, both from its tone and handwriting, that . . . you had obviously

thing earthly can realize." But before long a letter came from Speed, who had settled with his black-eyed Kentucky wife upon a well-stocked plantation, disclaiming any further fellowship of misery and announcing the beginnings of that life of uneventful happiness which he led ever after. His peace of mind has become a matter of course; he dismisses the subject in a line, but dilates, with a new planter's rapture, upon the beauties and attractions of his farm. Lincoln frankly answers that he cares nothing about his farm. "I can

GLOBE TAVERN, SPRINGFIELD, WHERE LINCOLN LIVED AFTER HIS MARRIAGE.

only say that I am glad *you* are satisfied and pleased with it. But on that other subject, to me of the most intense interest whether in joy or sorrow, I never had the power to withhold my sympathy from you. It cannot be told how it now thrills me with joy to hear you say you are 'far happier than you ever expected to be.' . . . I am not going beyond the truth when I tell you that the short space it took me to read your last letter gave me more pleasure than the total sum of all I have enjoyed since the fatal 1st of January, 1841. Since then it seems to me I should have been entirely happy, but for the never-absent idea that there is *one* still unhappy whom I have contributed to make so. That still kills my soul. I cannot but reproach myself for even wishing myself to be happy while she is otherwise."

During the summer of 1842 the letters of the friends still discuss, with waning intensity, however, their respective affairs of the heart. Speed, in the ease and happiness of his home, thanks Lincoln for his important part in his welfare, and gives him sage counsel for himself. Lincoln replies (July 4th, 1842), "I could not have done less than I did. I always was superstitious; I believe God made me one of the instruments of bringing your Fanny and you together, which union I have no doubt he foreordained. Whatever he designs, he will do for me yet." A better name than "superstition" might properly be applied to this frame of mind. He acknowledges Speed's kindly advice, but says, "Before I resolve to do the one thing or the other, I must gain my confidence in my own ability to keep my resolves when they are made. In that ability you know I once prided myself, as the only or

chief gem of my character; that gem I lost, how and where you know too well. I have not yet regained it; and until I do I cannot trust myself in any matter of much importance. I believe now, that had you understood my case at the time as well as I understood yours afterwards, by the aid you would have given me I should have sailed through clear; but that does not afford me confidence to begin that, or the like of that, again." Still, he was nearing the end of his doubts and self-torturing sophistry. A last glimpse of his imperious curiosity, kept alive by saucy hopes and fears, is seen in his letter to Speed of the 5th of October. He ventures, with

a genuine timidity, to ask a question which we may believe has not often been asked by one civilized man of another, with the hope of a candid answer, since marriages were celebrated with ring and book. "I want to ask you a close question—Are you now, in *feeling* as well as *judgment*, glad you are married as you are? From anybody but me this would be an impudent question, not to be tolerated; but I know you will pardon it in me. Please answer it quickly, as I am impatient to know." It is probable that Mr. Speed replied promptly in the way in which such questions must almost of necessity be answered. On the 4th of November, 1842, a marriage license was issued to Lincoln, and on the same day he was married, the ceremony being performed by the Rev. Charles Dresser.

In this way Abraham Lincoln met and passed through one of the most important crises of his life. There was so much of idiosyncrasy in it, that it has been, and will continue to be for years to come, the occasion of endless gossip in Sangamon County and elsewhere. Because it was not precisely like the experience of other people, who are married and given in marriage every day without any ado, a dozen conflicting stories have grown up, more or less false and injurious to both contracting parties. But it may not be fanciful to suppose that characters like that of Lincoln, elected for great conflicts and trials, are fashioned by different processes from those of ordinary men, and pass their stated ordeals in a different way. By circumstances which seem commonplace enough to commonplace people, he was thrown for more than a year into a sea of perplexities and sufferings beyond the reach of

the common run of souls. It is as useless as it would be indelicate to seek to penetrate in detail the incidents and special causes which produced in his mind this darkness as of the valley of the shadow of death. There was probably nothing worth recording in them; we are only concerned with their effect upon a character which was to be hereafter for all time one of the possessions of the nation. It is enough for us to know that a great trouble came upon him, and that he bore it nobly after his kind. That the manner in which he confronted this crisis was strangely different from that of most men in similar circumstances need surely occasion no surprise. Neither in this nor in other matters was he shaped in the average mold of his contemporaries. In many respects he was doomed to a certain loneliness of excellence. Few men that ever lived have had his stern and tyrannous sense of duty, his womanly tenderness of heart, his wakeful and inflexible conscience, which was so easy towards others and so merciless towards himself. Therefore when the time came for all of these qualities at once to be put to the most strenuous proof, the whole course of his development and tendency of his nature made it inevitable that his suffering should be of the keenest and his final triumph over himself should be of the most complete and signal character. In that struggle his youth of reveries and day-dreams passed away. Such furnace-blasts of proof, such pangs of transformation, seem necessary for the exceptional natures.

BRIG.-GEN. JAMES SHIELDS (1851).
(FROM A PHOTOGRAPH IN POSSESSION OF DAVID DELANY, ESQ.)

The bread eaten in tears, of which Goethe speaks, the sleepless nights of sorrow, are required for a clear vision of the celestial powers. Fortunately the same qualities that occasion the conflict insure the victory also. From days of gloom and depression, such as we have been considering, no doubt came precious results in the way of sympathy, self-restraint, and that sober reliance on the final triumph of good over evil peculiar to those who have been greatly tried but not destroyed. The late but splendid maturity of Lincoln's mind and character dates from this time, and, although he grew in strength and knowledge to the end, from this year we observe a steadiness and sobriety of thought and purpose, as discernible in his life as in his style. He was like a blade forged in fire and tempered in the ice-brook, ready for battle whenever the battle might come.

THE SHIELDS DUEL.

AN incident which occurred during the summer preceding Mr. Lincoln's marriage, and which in the opinion of many had its influence in hastening that event, deserves some atten-

HALLWAY OF THE SPEED HOMESTEAD.

political parties more than disgrace. The currency of the State banks was well-nigh worthless, but it constituted nearly the only circulating medium in the State. In the middle of August the Governor, Auditor, and Treasurer issued a circular forbidding the payment of State taxes in this depreciated paper. This order was naturally taken by the Whigs as indicating on the part of these officers a keener interest in the integrity of their salaries than in the public welfare, and it was therefore severely attacked in all the opposition newspapers of the State. The sharpest

THE SPEED HOMESTEAD AT FARMINGTON, THREE MILES FROM LOUISVILLE, WHERE LINCOLN VISITED IN 1841.

tion, if only from its incongruity with the rest of his history. This was the farce — which aspired at one time to be a tragedy — of his first and last duel. Among the officers of the State Government was a young Irishman named James Shields, who owed his post as Auditor, in great measure, to that alien vote which the Democrats had overturned the Supreme Court to gain. The finances of the State were in a deplorable condition: the treasury was empty; auditor's warrants were selling at half their nominal value; no more money was to be borrowed, and taxation was dreaded by both

assault it had to endure, however, was in a communication, dated August 27th, and printed in the "Sangamon Journal" of September 2d, not only dissecting the administration circular with the most savage satire, but covering the Auditor with merciless personal ridicule. It was written in the dialect of the country, dated from the "Lost Townships," and signed "Rebecca," and purported to come from a farmer widow of the county, who expressed in this fashion her discontent with the evil course of affairs.

Shields was a man of inordinate vanity

and a corresponding irascibility. He was for that reason an irresistible mark for satire. Through a long life of somewhat conspicuous public service, he never lost a certain tone of absurdity which can only be accounted for by the qualities we have mentioned. Even his honorable wounds in battle, while they were productive of great public applause and political success, gained him scarcely less ridicule than praise. He never could refrain from talking of them himself, having none of Coriolanus's repugnance in that respect, and for that reason was a constant target for newspaper wits. Mr. Prentice of Louisville once gravely said of him: "It is really wonderful that Shields survived that shot through his bowels. Now, if it had been through his head no one would have expected any serious result." After he returned from the Mexican war, with his laurels still green, and at the close of the canvass which had made him Senator, he wrote an incredible letter to Judge Breese, his principal competitor, in which he committed the gratuitous folly of informing him that "he had sworn in his heart [if Breese had been elected] that he should never have profited by his success; and depend upon it," he added, in the amazing and useless impudence of triumph, "I would have kept that vow, regardless of consequences. That, however, is now past, and the vow is canceled by your defeat." He then went on, with threats equally indecent, to make certain demands which were altogether inadmissible, and which Judge Breese only noticed by sending this preposterous letter to the press.*

It may easily be imagined that a man who, after being elected a Senator of the United States, was capable of the insane insolence of signing his name to a letter informing his defeated competitor that he would have killed him if the result had been different, would not have been likely, when seven years younger, to bear newspaper ridicule with equanimity. His fury against the unknown author of the satire was the subject of much merriment in Springfield, and the next week another letter appeared, from a different hand, but adopting the machinery of the first, in which the widow offered to make up the quarrel by marrying the Auditor, and this in time was followed by an epithalamium, in which this happy compromise was celebrated in very bad verses. In the change of hands all the humor of the thing had evaporated, and nothing was left but feminine mischief on one side and the exasperation of wounded vanity on the other. Shields, however, had talked so much about the matter that he now felt imperatively called upon to act, and he therefore sent General Whiteside to demand from the "Journal" the name

of its contributor. Mr. Francis, the editor, was in a quandary. Lincoln had written the first letter, and the antic fury of Shields had induced two young ladies who took a lively interest in Illinois politics — and with good reason, for one was to be the wife of a Senator and the other of a President — to follow up the game with attacks in prose and verse which, however deficient in wit and meter, were not wanting in pungency. In his dilemma he ap-

WILLIAM H. HERNDON. (FROM A PHOTOGRAPH BY INGMIRE.)

plied to Lincoln, who, as he was starting to attend court at Tremont, told him to give his name and withhold those of the ladies. As soon as Whiteside received this information, he and his fiery principal set out for Tremont, and as Shields did nothing in silence, the news came to Lincoln's friends, two of whom, William Butler and Dr. Merryman, one of those combative medical men who have almost disappeared from American society, went off in a buggy in pursuit. They soon came in sight of the others, but loitered in the rear until evening, and then drove rapidly to Tremont, arriving there some time in advance of Shields; so that in the ensuing negotiations Lincoln had the assistance of friends whose fidelity and whose nerve were equally beyond question. It would be useless to recount all the tedious preliminaries of the affair. Shields

* "National Intelligencer," Feb. 28, 1849.

HOUSE IN WHICH LINCOLN LIVED WHEN HE WAS ELECTED PRESIDENT.

opened the correspondence, as might have been expected, with blustering and with threats; his nature had no other way of expressing itself. His first letter was taken as a bar to any explanation or understanding, and he afterwards wrote a second, a little less offensive in tone, but without withdrawing the first. At every interview of the seconds General Whiteside deplored the bloodthirsty disposition of his principal, and urged that Mr. Lincoln should make the concessions which alone would prevent lamentable results. These representations seemed to avail nothing however, and the parties, after endless talk, went to Alton and crossed the river to the Missouri shore. It seemed for a moment that the fight must take place. The terms had been left by the code, as then understood in the West, to Lincoln, and he certainly made no grudging use of his privilege. The weapons chosen were "cavalry broadswords of the largest size"; and the combatants were to stand on either side of a board placed on the ground, each to fight in a limit of six feet on his own side of the board. It was evident that Lincoln did not desire the death of his adversary, and did not intend to be materially injured himself. The advantage morally was altogether against him. He felt intensely the stupidity of the whole affair, but thought he could not avoid it without degradation; while to Shields such a fracas was a delight. It came to its natural

end by the intervention of the usual "gods out of a machine," the gods being John J. Hardin and one Dr. English, and the machine a canoe in which they had hastily paddled across the Mississippi. Mr. Shields suffered himself to be persuaded to withdraw his offensive challenge. Lincoln then made the explanation he had been ready to make from the beginning; avowing the one letter he had written, and saying that it had been printed solely for political effect, and without any intention of injuring Shields personally.

One would think that, after a week passed in such unprofitable trifling, the parties, principal and secondary, would have been willing to drop the matter forever. We are sure that Lincoln would have been glad to banish it, even from his memory; but to men like Shields and Whiteside the peculiar relish and enjoyment of such an affair is its publicity. On the 3d of October, therefore, eleven days after the meeting, as public attention seemed to be flagging, Whiteside wrote an account of it to the "Sangamon Journal," for which he does not forget to say, "I hold myself responsible!" Of course he seizes the occasion to paint a heroic portrait of himself and his principal. It was an excellent story until the next week, when Dr. Merryman, who seems to have wielded a pen like a scalpel, gave a much fuller history of the matter, which he substantiated by printing all the documents, and,

not content with that, gave little details of the negotiations which show, either that Whiteside was one of the most grotesque braggarts of the time, or that Merryman was an admirable writer of comic fiction. Among the most amusing facts he brought forward was that Whiteside, being a Fund Commissioner of the State, ran the risk of losing his office by engaging in a duel; and his anxiety to appear reckless and dangerous, and yet keep within the statute and save his salary, was depicted by Merryman with a droll fidelity. He concluded by charging Whiteside plainly with "inefficiency and want of knowledge of those laws which govern gentlemen in matters of this kind," and with "trying to wipe out his fault by doing an act of injustice to Mr. Lincoln."

The town was greatly diverted by these pungent echoes of the bloodless fight, and Shields and Whiteside felt that their honor was still out of repair. A rapid series of challenges succeeded among the parties, principals and seconds changing places as deftly as dancers in a quadrille. The Auditor challenged Mr. Butler, who had been very outspoken in his contemptuous comments on the affair. Butler at once accepted, and with a grim sincerity announced his conditions — "to fight next morning at sunrising in Bob Allen's meadow, one hundred yards' distance, with rifles." This was instantly declined, with a sort of horror, by Shields and Whiteside, as such a proceeding would have proved fatal to their official positions and their means of livelihood. They probably cared less for the chances of harm from Butler's Kentucky rifle than for the certainty of the Illinois law which cut off all duelists from holding office in the State. But, on the other hand, so unreasonable is human nature as displayed among politicians, General Whiteside felt that if he bore patiently the winged words of Merryman, his availability as a candidate was greatly damaged; and he therefore sent to the witty doctor what Mr. Lincoln called "a quasi-challenge," hurling at him a modified defiance, which should be enough to lure him to the field of honor, and yet not sufficiently explicit to lose Whiteside the dignity and perquisites of Fund Commissioner. Merryman, not being an office-holder and having no salary to risk, responded with brutal directness, which was highly unsatisfactory to Whiteside, who was determined not to fight unless he could do so lawfully; and Lincoln, who now acted as second to the doctor in his turn, records the cessation of the correspondence amid the agonized explanations of Whiteside and the scornful hootings of Merryman, "while the town was in a ferment and a street fight

somewhat anticipated." In respect to the last diversion the town was disappointed.

Shields lost nothing by the hilarity which this burlesque incident created. He was reserved for a career of singular luck and glory mingled with signal misfortunes. With little discernible merit or availability about him except his nationality, he continued throughout a long lifetime to be selected at intervals for the highest positions, because he was an Irishman. After he ceased to be Auditor he was elected a judge of the Supreme Court of Illinois; while still holding that position he applied for the place of Commissioner of the General Land Office, and his application was successful. When the Mexican war broke out he asked for a commission as brigadier-general, although he still held his civil appointment, and, to the amazement of the whole army, he was given that important command before he had ever seen a day's service. At the battle of Cerro Gordo he was shot through the lungs, and this wound made him a Senator as soon as he returned from the war. After he had served one term in the Senate, he removed from Illinois, and was soon sent back to the same body from Minnesota. In the war of the rebellion he was again appointed a brigadier-general by his old adversary, for the same cogent ethnological reasons to which he owed all his honors, and was again wounded in a battle in which he defeated the redoubtable Stonewall Jackson; and many years after Lincoln was laid to sleep beneath a mountain of marble at Springfield, Shields was made the shuttlecock of contending demagogues in Congress — each striving to gain Irish votes by giving public money to the battered veteran — until in the impulse of that transient controversy, the State of Missouri, finding the gray-headed adventurer in her borders, for the third time sent him to the Senate of the United States for a few weeks — a history unparalleled even in America.

We have reason to think that the whole affair was excessively distasteful to Lincoln. He did not even enjoy the ludicrousness of it, as might have been expected. He never — so far as we can learn — alluded to it afterward, and the recollection of it died away so completely from the minds of people in the State, that during the heated canvass of 1860 there was no mention of this disagreeable episode in the opposition papers of Illinois. It had been absolutely forgotten.

This was Mr. Lincoln's last personal quarrel. Although the rest of his life was passed in hot and earnest debate, he never again descended to the level of his adversaries, who would gladly enough have resorted to unseemly wrangling. In later years it became

his duty to give an official reprimand to a young officer who had been court-martialed for a quarrel with one of his associates. The reprimand is probably the gentlest recorded in the annals of penal discourses, and it shows in few words the principles which ruled the conduct of this great and peaceable man. It has never before been published, and it deserves to be written in letters of gold on the walls of every gymnasium and college.

"The advice of a father to his son, 'Beware of entrance to a quarrel, but being in, bear it that the opposed may beware of thee!' is good, but not the best. Quarrel not at all. No man resolved to make the most of himself can spare time for personal contention. Still less can he afford to take all the consequences, including the vitiating of his temper and the loss of self-control. Yield larger things to which you can show no more than equal right; and yield lesser ones though clearly your own. Better give your path to a dog than be bitten by him in contesting for the right. Even killing the dog would not cure the bite."

THE CAMPAIGN OF 1844.

IN the letter to Stuart which we have quoted, Lincoln announced his intention to form a partnership with Judge Logan, which was soon carried out. His connection with Stuart was formally dissolved in April, 1841, and one with Logan formed which continued for four years. It may almost be said that Lincoln's practice as a lawyer begins from this time. Stuart, though even then giving promise of the distinction at which he arrived in his profession later in life, was at that period so entirely devoted to politics that the business of the office was altogether a secondary matter to him; and Lincoln, although no longer in his first youth, being now thirty-two years of age, had not yet formed those habits of close application which are indispensable to permanent success at the bar. He was not behind the greater part of his contemporaries in this respect. Among all the lawyers of the circuit who were then, or who afterwards became, eminent practitioners,* there were few indeed who in those days applied themselves with any degree of persistency to the close study of legal principles. One of these few was Stephen T. Logan. He was more or less a politician, as were all his compeers at the bar, but he was always more a lawyer than anything else. He had that love for his profession which it jealously exacts as a condition of succeeding. He possessed few books, and it used to be said of him long afterwards that he carried his library in his hat. But the books which he had he never ceased to read and ponder, and we heard

him say when he was sixty years old, that once every year since he came of age he had read "Blackstone's Commentaries" through. He had that old-fashioned, lawyer-like morality which was keenly intolerant of any laxity or slovenliness of mind or character. His former partner had been Edward D. Baker, but this brilliant, mercurial, irascible spirit was not congenial to Logan; Baker's carelessness in money matters was intolerable to him, and he was glad to escape from an associate so gifted and so exasperating.† Needing some one, however, to assist him in his practice, which was then considerable, he invited Lincoln into partnership. He had, as we have seen, formed a favorable opinion of the young Kentuckian the first time they had met. In his subsequent acquaintance with him he had come to recognize and respect his abilities, his unpretending common sense, and his innate integrity. The partnership continued about four years, but the benefit Lincoln derived from it lasted all his life. The example of Judge Logan's thrift, order, and severity of morals; his straightforward devotion to his profession; his close and careful study of his cases, together with the larger and more important range of practice to which Lincoln was introduced by this new association, confirmed all those salutary tendencies by which he had been led into the profession, and corrected those less desirable ones which he shared with most of the lawyers about him. He began for the first time to study his cases with energy and patience; to resist the tendency, almost universal at that day, to supply with florid rhetoric the attorney's deficiency in law; in short, to educate, discipline, and train the enormous faculty, hitherto latent in him, for close and severe intellectual labor. Logan, who had expected that Lincoln's chief value to him would be as a talking advocate before the jury, was surprised and pleased to find his new partner rapidly becoming a lawyer. "He would study out his case and make about as much of it as anybody," said Logan, many years afterwards. "His ambition as a lawyer increased; he grew constantly. By close study of each case, as it came up, he got to be quite a formidable lawyer." The character of the man is in these words. He had vast concerns intrusted to him in the

* They were Dan Stone, Jesse B. Thomas, Cyrus Walker, Schuyler Strong, A. T. Bledsoe, George Forquer, S. H. Treat, Ninian W. Edwards, Josiah Lam-born, John J. Hardin, E. D. Baker, and others.

† Logan's office was, in fact, a nursery of statesmen. Three of his partners, William L. May, Baker, and Lincoln, left him in rapid succession to go to Congress, and finally the contagion gained the head of the firm, and the Judge was himself the candidate of his party, when it was no longer able to elect one. After he had retired from practice, the office, under his son-in-law and successor, Milton Hay, retained its prestige for cradling public men. Palmer and Cullom left it to be Governors of the State, and the latter to be a Congressman and Senator.

course of his life, and disposed of them one at a time as they were presented. At the end of four years the partnership was dissolved. Judge Logan took his son David—afterwards a well-known politician and lawyer of Oregon—into his office, and Lincoln opened one of his own, into which he soon invited a young, bright, and enthusiastic man named William Henry Herndon, who remained his partner as long as he lived.

The old partners remained close and intimate friends. They practiced at the same bar for twenty years, often as associates, and often as adversaries, but always with relations of mutual confidence and regard. They had the unusual honor, while they were still comparatively young men, of seeing their names indissolubly associated in the map of their State as a memorial to future ages of their friendship and their fame, in the county of Logan, of which the city of Lincoln is the county seat.

They both prospered, each in his way. Logan rapidly gained a great reputation and accumulated an ample fortune. Lincoln, while he did not become rich, always earned a respectable livelihood, and never knew the care of poverty or debt from that time forward. His wife and he suited their style of living to their means, and were equally removed from luxury and privation. They went to live, immediately after their marriage, at a boarding-house* called "The Globe," which was "very well kept by a widow lady of the name of Beck," and there their first child was born, who was one day to be Secretary of War, and for whom was reserved the strange experience of standing by the death-bed of two assassinated Presidents. Lincoln afterwards built a comfortable but unpretending house of wood on the corner of Eighth and Jackson streets, where he lived until he removed to the Executive Mansion.

Neither his marriage nor his new professional interests, however, put an end to his participation in politics. Even that period of gloom and depression of which we have spoken, and which has been so much exaggerated by the chroniclers and the gossip of Springfield, could not have interrupted for any length of time his activity as a member of the Legislature. Only for a few days was he absent from his place in the House. On the 19th of January, 1841, John J. Hardin apologized for the delay in some committee business, alleging Mr. Lincoln's indisposition as an excuse. On the 23d the letter to Stuart was written; but on the 26th Lincoln had so far recovered his self-possession as to resume his place in the House and the leader-

ship of his party. The journals of the next month show his constant activity and prominence in the routine business of the Legislature until it adjourned. In August Stuart was re-elected to Congress. Lincoln made his visit to Kentucky with Speed, and returned to find himself generally talked of for Governor of the State. This idea did not commend itself to the judgment of himself or his friends, and accordingly we find in the "Sangamon Journal" one of those semi-official announcements so much in vogue in early Western politics, which, while disclaiming any direct inspiration from Mr. Lincoln, expresses the gratitude of his friends for the movement in his favor, but declines the nomination.

"His talents and services endear him to the Whig party; but we do not believe he desires the nomination. He has already made great sacrifices in maintaining his party principles, and before his political friends ask him to make additional sacrifices, the subject should be well considered. The office of Governor, which would of necessity interfere with the practice of his profession, would poorly compensate him for the loss of four of the best years of his life."

He served this year as a member of the Whig Central Committee, and bore a prominent part in the movement set on foot at that time to check intemperance in the use of spirits. It was a movement in the name and memory of Washington, and the orators of the cause made effective rhetorical use of its august associations. A passage from the close of a speech made by Lincoln, in March, 1842, shows the fervor and feeling of the hour:

"Washington is the mightiest name of earth—long since mightiest in the cause of civil liberty; still mightiest in moral reformation. On that name no eulogy is expected. It cannot be. To add brightness to the sun or glory to the name of Washington is alike impossible. Let none attempt it. In solemn awe pronounce the name, and in its naked, deathless splendor leave it shining on."

A mass meeting of the Whigs of the district was held at Springfield on the 1st of March, 1843, for the purpose of organizing the party for the elections of the year. On this occasion Lincoln was the most prominent figure. He called the meeting to order, stated its object, and drew up the platform of principles, which embraced the orthodox Whig tenets of a protective tariff, national bank, the distribution of the proceeds of the public lands, and, finally, the tardy conversion of the party to the convention system, which had been forced upon them by the example of the Democrats, who had shown them that victory could not be organized without it. Lincoln was also chairman of the committee which was charged with the address to the people, and a paragraph from this document is worth quoting, as showing the use which he made

* This house is still standing, opposite St. Paul's church.

at that early day of a pregnant text which was hereafter to figure in a far more momentous connection, and exercise a powerful influence upon his career. Exhorting the Whigs to harmony, he says: "That union is strength is a truth that has been known, illustrated, and declared in various ways and forms in all ages of the world. That great fabulist and philosopher, Æsop, illustrated it by his fable of the bundle of sticks; and he whose wisdom surpasses that of all philosophers has declared that 'a house divided against itself cannot stand.'" He calls to mind the victory of 1840, the overwhelming Whig majority of that year, the ill success of the party since, and the necessity of unity and concord that the party may make its entire strength felt.

Lincoln was at this time a candidate for the Whig nomination to Congress; but he was confronted by formidable competition. The adjoining county of Morgan was warmly devoted to one of its own citizens, John J. Hardin, a man of an unusually gallant and chivalrous strain of character; and several other counties, for reasons not worth considering, were pledged to support any one whom Morgan county presented. If Lincoln had carried Sangamon county, his strength was so great in Menard and Mason, where he was personally known, that he could have been easily nominated. But Edward D. Baker had long coveted a seat in Congress, and went into the contest against Lincoln with many points in his favor. He was of about the same age, but had resided longer in the district, had a larger personal acquaintance, and was a much readier and more pleasing speaker. In fact, there are few men who have ever lived in this country with more of the peculiar temperament of the orator than Edward Dickinson Baker. It is related of him that on one occasion when the circumstances called for a policy of reserve, he was urged by his friends to go out upon a balcony and address an impromptu audience which was calling for him. "No," he replied, mistrusting his own fluency; "if I go out there, I'll make a better speech than I want to." He was hardly capable of the severe study and care by which great parliamentary speakers are bred; but before a popular audience, and on all occasions where brilliant and effective improvisation is called for, he was almost unequalled. His funeral oration over the dead body of Senator Broderick in California, his thrilling and inspiring appeal in Union Square, New York, at the great meeting of April, 1861, and his reply to Breckinridge in the Senate delivered upon the impulse of the moment, conceived as he listened to the Kentuckian's peroration, leaning against the doorway of the

Chamber in full uniform, booted and spurred, as he had ridden into Washington from the camp, are among the most remarkable specimens of absolutely improvised and thrilling eloquence which our annals contain. He was also a man of extremely prepossessing appearance. Born in England of poor but educated parents, and brought as a child to this country, his good looks and brightness had early attracted the attention of prominent gentlemen in the State, especially of Governor Edwards, who had made much of him and assisted him to a good education. He had met with considerable success as a lawyer, though he always relied rather upon his eloquence than his law, and there were few juries which could resist the force and fury of his speech, and not many lawyers could keep their own equanimity in the face of his witty persiflage and savage sarcasm. To all this add a genuine love of every species of combat, physical and moral, and we may understand the name Charles Sumner — paraphrasing a well-known epigram — applied to him in the Senate, after his heroic death at Ball's Bluff, "the Prince Rupert of battle and debate."

If Baker had relied upon his own unquestionable merits he would have been reasonably sure of succeeding in a community so well acquainted with him as Sangamon county. But to make assurance doubly sure his friends resorted to tactics which Lincoln, the most magnanimous and placable of men, thought rather unfair. Baker and his wife belonged to that numerous and powerful sect which has several times played so important a part in Western politics — the Disciples. They all supported him energetically, and used as arguments against Lincoln that his wife was a Presbyterian, that most of her family were Episcopalians, that Lincoln himself belonged to no church and that he had been suspected of deism, and, finally, that he was the candidate of the aristocracy. This last charge so amazed Lincoln that he was unable to frame any satisfactory answer to it. The memory of his flat-boating days, of his illiterate youth, even of his deer-skin breeches shrunk by rain and exposure, appeared to have no power against this unexpected and baleful charge. When the county convention met, the delegates to the district convention were instructed to cast the vote of Sangamon for Baker. It showed the confidence of the convention in the imperturbable good-nature of the defeated candidate that they elected him a delegate to the Congressional convention charged with the cause of his successful rival. In a letter to Speed, he humorously refers to his situation as that of a rejected suitor who is asked to act as groomsman at the wedding of his sweetheart.

It soon became evident that Baker could not get strength enough outside of the county to nominate him. Lincoln in a letter to Speed, written in May, said: "In relation to our Congress matter here, you were right in supposing I would support the nominee. Neither Baker nor I, however, is the man, but Hardin, so far as I can judge from present appearances. We shall have no split or trouble about the matter; all will be harmony." A few days later this prediction was realized. The convention met at Pekin, nominated Hardin with all the customary symptoms of spontaneous enthusiasm. He was elected in August,* after a short but active canvass, in which Lincoln bore his part as usual. Hardin took his seat in December. The next year the time of holding elections was changed, and always afterwards the candidates were elected the year before vacancies were to occur. In May, 1844, therefore, Baker attained the desire of his heart by being nominated, and in August he was elected, defeating John Calhoun, while Lincoln had the laborious and honorable post of Presidential Elector.

It was not the first nor the last time that he acted in this capacity. The place had become his by a sort of prescription. His persuasive and convincing oratory was thought so useful to his party that every four years he was sent, in the character of electoral canvasser, to the remotest regions of the State to talk to the people in their own dialect, with their own habits of thought and feeling, in favor of the Whig candidate. The office had its especial charm for him: if beaten, as generally happened, the defeat had no personal significance; if elected, the functions of the place were discharged in one day, and the office passed from existence. But there was something more than the orator and the partisan concerned in this campaign of 1844. The whole heart of the man was enlisted in it — for the candidate was the beloved and idolized leader of the Whigs, Henry Clay. It is probable that we shall never see again in this country another such instance of the personal devotion of a party to its chieftain as that which was shown by the long and wonderful career of Mr. Clay. He became prominent in the politics of Kentucky near the close of the last century at twenty-three years of age. He was elected first to the Senate at twenty-nine. He died a Senator at seventy-five, and for the greater part of that long interval he was the most considerable personal influence in American politics. As Senator, Representative,

Speaker of the House, and diplomatist, he filled the public eye for half a century, and although he twice peremptorily retired from office, and although he was the mark of the most furious partisan hatred all his days, neither his own weariness nor the malice of his enemies could ever keep him for any length of time from that commanding position for which his temperament and his nature designed him. He was beloved, respected, and served by his adherents with a single-hearted allegiance which seems impossible to the more complex life of a later generation. In 1844, it is true, he was no longer young, and his power may be said to have been on the decline. But there were circumstances connected with this his last candidacy which excited his faithful followers to a peculiar intensity of devotion. He had been, as many thought, unjustly passed over in 1840, and General Harrison, a man of greatly inferior capacity, preferred to him on grounds of prudence and expediency, after three days of balloting had shown that the eloquent Kentuckian had more friends and more enemies than any other man in the Republic. He had seemed to regain all his popularity by the prompt and frank support which he gave to the candidacy of Harrison; and after the President's death and the treachery of Tyler had turned the victory of the Whigs into dust and ashes, the entire party came back to Clay with passionate affection and confidence, to lead them in the desperate battle which perhaps no man could have won. The Whigs, however, were far from appreciating this. There is evident in all their utterances of the spring and early summer of 1844, an ardent and almost furious conviction, not only of the necessity but the certainty of success. Mr. Clay was nominated long before the convention met in Baltimore. The convention of the 1st of May only ratified the popular will; no other name was mentioned. Mr. Watkins Leigh had the honor of presenting his name, "a word," he said "that expressed more enthusiasm, that had in it more eloquence, than the names of Chatham, Burke, Patrick Henry, and," he continued, rising to the requirements of the occasion, "to us more than any other and all other names together." Nothing was left to be said, and Clay was nominated without a ballot; and Mr. Lumpkin of Georgia then nominated Theodore Frelinghuysen for Vice-President, not hesitating to avow, in the warmth and expansion of the hour, that he believed the baptismal name of the New Jersey gentleman had a mystical appropriateness to the occasion.

In the Democratic convention Mr. Van Buren had a majority of delegates pledged to support him; but it had already been resolved

* The opposing candidate was James A. McDougal, who was afterwards, as Senator from California, one of the most remarkable and eccentric figures in Washington life.

in the inner councils of the party that he should be defeated. The Southern leaders had determined upon the immediate and unconditional annexation of Texas, and Mr. Van Buren's views upon this vital question were too moderate and conservative to suit the adventurous spirits who most closely surrounded President Tyler. During the whole of the preceding year a steady and earnest propaganda of annexation had been on foot, starting from the immediate *entourage* of the President and embracing a large number of Southern Congressmen. A letter had been elicited from General Jackson* declaring with his usual vehemence in favor of the project, and urging it upon the ground that Texas was absolutely necessary to us, as the most easily defensible frontier against Great Britain. Using the favorite argument of Southerners of his school, he said: "Great Britain has already made treaties with Texas; and we know that far-seeing nation never omits a circumstance in her extensive intercourse with the world which can be turned to account in increasing her military resources. May she not enter into an alliance with Texas? And, reserving, as she doubtless will, the North-western boundary question as the cause of war with us whenever she chooses to declare it — let us suppose that, as an ally with Texas, we are to fight her. Preparatory to such a movement she sends her 20,000 or 30,000 men to Texas; organizes them on the Sabine, where supplies and arms can be concentrated before we have even notice of her intentions; makes a lodgment on the Mississippi; excites the negroes to insurrection; the lower country falls, with it New Orleans; and a servile war rages through the whole South and West." These fanciful prophecies of evil were privately circulated for a year among those whom they would be most likely to influence, and the entire letter was printed in 1844, with a result never intended by the writer. It contributed greatly, in the opinion of many,† to defeat Van Buren, whom Jackson held in great esteem and regard, and served the purposes of the Tyler faction, which he detested. The argument based on imaginary British intrigues was the one most relied upon by Mr. Tyler's successive secretaries of state. Mr. Calhoun in his dispatch of the 12th of August, 1844, instructed our minister in Paris to impress upon the Government of France the nefarious character of the English diplomacy, which was seeking, by defeating the annexation of Texas, to accomplish the abolition of slavery first in that region, and afterwards

throughout the United States, "a blow calamitous to this continent beyond description." No denials on the part of the British Government had any effect; it was a fixed idea of Calhoun and his followers that the designs of Great Britain against American slavery could only be baffled by the annexation of Texas. Van Buren was not in principle opposed to the admission of Texas into the Union at the proper time and with the proper conditions, but the more ardent Democrats of the South were unwilling to listen to any conditions or any suggestion of delay. They succeeded in inducing the convention to adopt the two-thirds rule, after a whole day of stormy debate, and the defeat of Van Buren was secured. The nomination of Mr. Polk was received without enthusiasm, and the exultant hopes of the Whigs were correspondingly increased.

Contemporary observers differ as to the causes which gradually, as the summer advanced, changed the course of public opinion to such an extent as to bring defeat in November upon a party which was so sure of victory in June. It has been the habit of the anti-slavery Whigs who have written upon the subject to ascribe the disaster to an indiscretion of the candidate himself. At the outset of the campaign Mr. Clay's avowed opinion as to the annexation of Texas was that of the vast majority of his party, especially in the North. While not opposing an increase of territory under all circumstances, he said, — in a letter written from Raleigh, N. C., two weeks before his nomination, — "I consider the annexation of Texas, at this time, without the consent of Mexico, as a measure compromising the national character, involving us certainly in war with Mexico, probably with other foreign powers, dangerous to the integrity of the Union, inexpedient in the present financial condition of the country, and not called for by any expression of public opinion." He supported these views with temperate and judicious reasons which were received with much gratification throughout the country. Of course they were not satisfactory to every one, and Mr. Clay became so disquieted by letters of inquiry and of criticism from the South, that he was at last moved, in an unfortunate hour, to write another letter to a friend in Alabama, which was regarded as seriously modifying the views he had expressed in the letter from Raleigh. He now said, "I have no hesitation in saying that, far from having any personal objections to the annexation of Texas, I should be glad to see it — without dishonor, without war, with the common consent of the Union, and upon just and fair terms. . . . I do not think the subject of slavery ought to affect the question one way or the other, whether Texas be indepen-

* This letter is dated at the Hermitage, Feb. 13, 1843, and was printed a year later in the "National Intelligencer," with the date altered to 1844.

† Benton: "Thirty Years' View."

dent or incorporated in the United States. I do not believe it will prolong or shorten the duration of that institution. It is destined to become extinct, at some distant day, in my opinion, by the operation of the inevitable laws of population. It would be unwise to refuse a permanent acquisition, which will exist as long as the globe remains, on account of a temporary institution." Mr. Clay does not in this letter disclaim or disavow any sentiments previously expressed. He says, as any one might say, that provided certain impossible conditions were complied with, he would be glad to see Texas in the Union, and that he was so sure of the ultimate extinction of slavery that he would not let any consideration of that transitory system interfere with a great national advantage. It might naturally have been expected that such an expression would have given less offense to the opponents than to the friends of slavery. But the contrary effect resulted, and it soon became evident that a grave error of judgment had been committed in writing the letter. The principal opposition to annexation in the North had been made expressly upon the ground that it would increase the area of slavery, and the comparative indifference with which Mr. Clay treated that view of the subject cost him heavily in the canvass. Mr. Greeley, who should be regarded as an impartial witness in such a case, says,* "The 'Liberty Party,' so called, pushed this view of the matter beyond all justice and reason, insisting that Mr. Clay's antagonism to annexation, not being founded in anti-slavery conviction, was of no account whatever, and that his election should, on that account, be opposed." It availed nothing that Mr. Clay, alarmed at the defection in the North, wrote a third and final letter, reiterating his unaltered objections to any such annexation as was at that time possible. The damage was irretrievable. It is not probable that his letters gained or saved him a vote in the South among the advocates of annexation. They cared for nothing short of their own unconditional scheme of immediate action. They forgot the services rendered by Mr. Clay in bringing about the recognition of Texan independence a few years before.

They saw that Mr. Polk was ready to risk everything—war, international complications, even the dishonor of broken obligations—to accomplish their purpose, and nothing the Whig candidate could say would weigh anything in the balance against this blind and reckless readiness. On the other hand, Mr. Clay's cautious and moderate position did him irreparable harm among the ardent opponents of slavery. They were not willing to listen to the counsels of caution and moderation. More than a year

before, thirteen of the Whig anti-slavery Congressmen, headed by the illustrious John Quincy Adams, had issued a fervid address to the people of the free States, declaiming in language of passionate force against the scheme of annexation as fatal to the country, calling it, in fact, "identical with dissolution," and saying that "it would be a violation of our national compact, its objects, designs, and the great elementary principles which centered in its formation of a character so deep and fundamental, and would be an attempt to eternize an institution and a power of nature so unjust in themselves, so injurious to the interests and abhorrent to the feelings of the people of the free States, as in our opinion, not only inevitably to result in a dissolution of the Union, but fully to justify it; and we not only assert that the people of the free States ought not to submit to it, but we say with confidence they would not submit to it." To men in a temper like that indicated by these words, no arguments drawn from consideration of political expediency could be expected to have any weight, and it was of no use to say to them that in voting for a third candidate they were voting to elect Mr. Polk, the avowed and eager advocate of annexation. If all the votes cast for Mr. Birney, the "Liberty" candidate, had been cast for Clay, he would have been elected, and even as it was the contest was close and doubtful to the last. Birney received 62,270 votes, and the popular majority of Polk over Clay was only 38,801.

The attitude of the two parties in relation to this question was perhaps inevitable, and the result was also sure, whatever the subordinate events or incidents which may have led to it. It was impossible to defeat or greatly delay the annexation of Texas, and it showed a certain lack of sagacity on the part of the Whigs not to recognize this fact. Here was a great empire offering itself to us—a state which had gained its independence, and built itself into a certain measure of order and thrift through American valor and enterprise. She offered us a magnificent estate of 376,000 square miles of territory, all of it valuable, and much of it of unsurpassed richness and fertility. Even those portions of it once condemned as desert now contribute to the markets of the world vast stores of wool and cotton, herds of cattle and flocks of sheep. Not only were these material advantages of great attractiveness to the public mind, but many powerful sentimental considerations reënforced the claim of Texas. The Texans were not an alien people. The few inhabitants of that vast realm were mostly Americans, who had occupied and subdued a vacant wilderness. The heroic defense of the Alamo had been made by Travis and David

* "American Conflict," I. p. 167.

Crockett, whose exploits and death form one of the most brilliant pages of our border history. Fannin and his men, four hundred strong, when they laid down their lives at Goliad * had carried mourning into every South-western State; and when, a few days later, Houston and his eight hundred raw levies defeated and destroyed the Mexican army at San Jacinto, captured Santa Anna, the Mexican president, and with American thrift, instead of giving him the death he merited for his cruel murder of unarmed prisoners, saved him to make a treaty with, the whole people recognized something of kinship in the unaffected valor with which these borderers died and the humorous shrewdness with which they bargained, and felt as if the victory over the Mexicans were their own. Under these conditions, the annexation, sooner or later, was inevitable. No man and no party could oppose it except at serious cost. It is not true that schemes of annexation are always popular. Several administrations have lost heavily by proposing them. Grant failed with Santo Domingo; Seward with St. Thomas; and it required all his skill and influence to accomplish the ratification of the Alaska purchase. There is no general desire among Americans for acquiring outlying territory, however intrinsically valuable it may be; their land-hunger is confined within the limits of that of a Western farmer once quoted by Mr. Lincoln, who used to say, "I am not greedy about land; I only want what jines mine." Whenever a region contiguous to the United States becomes filled with Americans, it is absolutely certain to come under the American flag. Texas was as sure to be incorporated into the Union as are two drops of water touching each other to become one; and this consummation would not have been prevented for any length of time if Clay or Van Buren had been elected in 1844. The honorable scruples of the Whigs, the overheated consciences of the "Liberty" men, could never permanently have prevailed against a tendency so natural and so irresistible.

Everything that year seemed to work against the Whigs. At a most unfortunate time for them, there was an outbreak of that "na-

tive" fanaticism which reappears from time to time in our politics with the periodicity of malarial fevers, and always to the profit of the party against which its efforts are aimed. It led to great disturbances in several cities, and to riot and bloodshed in Philadelphia. The Clay party were, of course, free from any complicity with these outrages, but the foreigners, in their alarm, huddled together almost as one man on the side where the majority of them always voted, and this occasioned a heavy loss to the Whigs in several States. The first appearance of Lincoln in the canvass was in a judicious attempt to check this unreasonable panic. At a meeting held in Springfield, June 12th, he introduced and supported resolutions, declaring that "the guarantee of the rights of conscience as found in our Constitution is most sacred and inviolable, and one that belongs no less to the Catholic than the Protestant, and that all attempts to abridge or interfere with these rights either of Catholic or Protestant, directly or indirectly, have our decided disapprobation, and shall have our most effective opposition." Several times afterwards in his life Lincoln was forced to confront this same proscriptive spirit among the men with whom he was more or less affiliated politically, and he never failed to denounce it as it deserved, whatever might be the risk of loss involved.

Beginning with this manly protest against intolerance and disorder, he went into the work of the campaign and continued in it with unabated ardor to the end. The defeat of Clay affected him, as it did thousands of others, as a great public calamity and a keen personal sorrow. It is impossible to mistake the accent of sincere mourning which we find in the journals of the time. The addresses which were sent to Mr. Clay from every part of the country indicate a depth of affectionate devotion which rarely falls to the lot of a political chieftain. An extract from the one sent by the Clay Clubs of New York will show the earnest attachment and pride with which the young men of that day still declared their loyalty to their beloved leader, even in the midst of irreparable disaster.

"We will remember you, Henry Clay, while the memory of the glorious or the sense of the good remains in us, with a grateful and admiring affection which shall strengthen with our strength and shall not decay with our decline. We will remember you in all our future trials and reverses as him whose name honored defeat and gave it a glory which victory could not have brought. We will remember you when patriotic hope rallies again to successful contest with the agencies of corruption and ruin; for we will never know a triumph which you do not share in life, whose glory does not accrue to you in death."*

* This massacre inspired one of the most remarkable poems of Walt Whitman, "Now I tell you what I knew of Texas in my early youth," in which occurs his description of the rangers:

"They were the glory of the race of rangers,
Matchless with horse, rifle, song, supper, courtship,
Large, turbulent, generous, handsome, proud, and affectionate,
Bearded, sunburnt, drest in the free costume of hunters,
Not a single one over thirty years of age."

* For assistance in obtaining illustrations to accompany this History, we are especially indebted, among others, to General Fayette Hewitt, of Frankfort, Ky., Judge A. M. Brown, of Elizabethtown, Ky., Mr. John W. Keyes, of the Lincoln Memorial Collection of Chicago, and to Colonel Reuben T. Durrett, of Louisville, Ky.

"The Casting Away of Mrs. Lecks and Mrs. Aleshine," etc.

VII.

R. ENOCH BULL-
RIPPLE lay in his
bed, in his room at
his lodging-house,
and gazed steadily
at a large litho-
graphic picture of
the death-bed of Jonathan Edwards which
hung on the wall opposite to him. This work
of art was moderately lighted by a cluster of
electric lamps, which, half a mile from his
window, was suspended two hundred feet in
air for the all-night lighting of a city park
and its surrounding bedrooms. He thought
nothing of the expiring theologian, but he was
thinking very earnestly and actively of the
conversation he had just had with his sister in
regard to the expediency of bringing about a
holiday for his nephew, John. Enoch would
have been very glad to do this solely for the
sake of the young man, who truly needed rest
and recreation; but he was much more will-
ing to do it for his own sake. He greatly
desired to have the opportunity to institute
an inquisition into the constitution of the
Vatoldi establishment, and this he believed
could be done only in John's absence. In
devising and discarding this plan and that
for getting rid of John for a few days, Mr.
Bullripple fell asleep.

In another room of the lodging-house lay
Mrs. People gazing at a steel engraving of a
hunter returning from the chase, surrounded
by piles of dead game, the transportation of
which could only be accounted for by suppos-
ing that he coaxed the various creatures to
his door-step and there despatched them.
But Mrs. People thought not of the hunter or
his victims; her mind was fixed upon the
necessity of getting John off for a holiday
before old Vatoldi came in from the country,
or wherever it was that he was staying. In
devising and discarding plans for this purpose
she fell asleep.

Very early the next day this worthy brother
and sister, each utterly planless, and some-
what dejected on that account, made their
way to Vatoldi's, where, of course, they took

their meals. Enoch was much the faster
walker, and, partly because she was tired
keeping up with him, and partly because she
wanted an apple, a fruit that was not to be
had at Vatoldi's at that season, she stopped
at the stand of Dennis Roon, where she had
bought apples before, and had thus formed a
slight acquaintance with the proprietor.

Mr. Roon was an apple-stand keeper of
prominence. In fact, his stand, which was at
the corner of two busy streets, not far from
Vatoldi's, was, from a certain point of view,
the most important place of business in the
neighborhood. This point of view was Dennis
Roon's point of view. Nothing could be so
important in the eyes of himself and his fam-
ily as that the stand should be opened at the
proper time in the morning; that certain
apples should be rubbed and placed in one
compartment; that certain other apples should
be rubbed and placed in another compart-
ment; that this bunch of bananas should be
turned this way, and that bunch should be
turned the other way; and that just so many
oranges should be kept in a corner box where
they would attract the attention of people
coming from different directions. These mat-
ters, with many others, such as the probable
relation of the weather to the day's trade, or
the varied arrangements of the little awning, so
that keeping off the sunshine should not inter-
fere too much with the attraction of purchasers,
were discussed with as much earnestness and
warmth by Dennis, his wife and son and old-
est daughter, as if they had been questions of
Home Rule or Pan-Electricity.

Dennis was a strong-built, black-bearded
man, loaded and crammed, from the crown
of his head to the heel of his foot, with active
vitality. He was never still so long as there
was anything to do, and never silent so long as
there was anybody to speak to. In connection
with his stand he carried on the business of
boot-blackening, and two arm-chairs, one on
each street, were always ready for customers.
The son and heir, with shirt-sleeves of the same
blue flannel spotted with white of which his
father's sleeves were made, was the boot-black,
but when occasion required Dennis would dash
from boots to apples and from apples to boots

with astonishing readiness and celerity. In the earliest hours of street pedestrianism his stand was open, and his wares remained on view and sale until after midnight. Even on Sundays the business went on, and the halo of importance hung over the stand. If on a fine Sunday one of Dennis's customers, dressed in his best clothes and smoking the cigar in which he always indulged of a Sunday morning, came from his house with an air of leisurely independence to buy his Sunday paper and have his boots blacked, and chanced to bring his little girl along with him, it was ten, or even eleven, to one that Dennis gave that little girl an apple, selecting the fruit from a box in the lower part of the stand. This apple would be specked, and not one which the customer would have bought had he been buying apples, but, as it was a present to his child, he walked away with that feeling of elevated satisfaction which is caused by the reception of presents which we feel are tributes to the value of our patronage.

Mrs. People selected a well-preserved red apple from the stand, and then she said :

"It seems to me it is very late for apples. In our part of the country they were gone long ago. Where do these come from?"

"From the market down town," answered Dennis; "but where the trees grow I niver heard. But ye can always thrust to there bein' apples all the year round. The old ones always waits till the new ones cooms."

"That's very different from what it is up our way," said Mrs. People, "but it's a lucky thing that city folks have somethin' to console themselves with. I've barely been here two days yet, and I'm hankerin' for home."

"You're havin' a hard time there at Valtoldi's, mum," said Dennis, who knew all about the boycott, and had taken a great interest in its progress; "and if ye'd coom to town when things was smoothen ye'd a liked it better. And ain't there no signs of them blockheads coomin' back to work and givin' up their coat-tails? If I was Mr. People that kapes the place, I'd break the head of ivery one of 'em that said 'tail' to me."

"Mr. People is my son, sir, and he don't keep the place himself, which I wish he did, because then I'd make him give it up, and come home, and go to farmin', like his father before him. But here he is, wearin' himself out, and killin' himself, for somebody else. For, as I said to him yesterday, 'it's no difference to you, John, whether they wear jackets or coat-tails; and if I was you, I'd just go home and rest for a spell while there is so little doin', and let old Valtoldi come down and settle the business with the waiters himself.'"

"I thought that man was dead, mum," said Dennis.

"He isn't dead a bit," answered Mrs. People. "He's livin' up the North River somewhere, either at Yonkers or Newburgh; at least, that's what I take it to be from what John tells me, though he never named either of them towns. And then, as I was sayin', if John could be got off into the country,—and he's not had a decent rest for nigh on to two years,—the old man would have to come down; and then me and my brother—that's Mr. Bull-ripple—could go home too."

Dennis paused in the removal of the wrapping from an orange he held in his hand, and turned towards Mrs. People. "It's my opinion, mum," he said, "that you've pitched your hat right into the middle of that boycott business, and if you go there to pick it up, you'll see things just as they is. As like as not, them waiters is more set agin your son, mum, than they would be agin anybody else, because he's the one that won't let 'em have their coat-tails. Now, if he was to go away, and let the head boss coom and talk to them, he might be able to sthraighten things out quicker than Mither People could do it. Though I must say, mum, that I'd feel like warmin' their jackets for 'em after they put 'em on."

"But we can't get him to go," said Mrs. People, who had half eaten her apple. "He won't listen to it."

"If ye could make him see, mum," said Mr. Roon, "that it wasn't on'y for the good of his hilt, but for the good of the business, perhaps he'd go."

"It's no use," said Mrs. People, shaking her head. "Me and his uncle has talked and talked to him, but you might as well try to push down a lamp-post as to move John."

"There is them, mum," said Dennis, "which if they won't move for their own good, must be moved by their frinds. And that brings to me moind the case of me sister-in-law, Missis Follory. She was very bad with the consumption, mum, most part of her lungs bein' gone, and the rest just like wood for hardness; and the doctor said she ought to go to Cuby, and breathe sugar."

"Breathe what?" exclaimed Mrs. People.

"They go into the houses where they make sugar, mum, and the air is all full of sugar and melasses, and they breathe that, and it ayther makes their lungs grow agin, or softens 'em, I niver knew which; but it's good for consumption. And that's what the doctor said she must do. But niver an inch would Missis Follory budge, though all her frinds and relations got after her and towld her that she was just murtherin' herself to sit there a-sewin'

and contractin' her chist whin she might as well be recoverin' her hilth, a-breathin' sugar and melasses, and, perhaps, a little bit of Jamaiky rum, too, for I don't see how they can keep that out of the air any more'n the ither things; and Mike Follory, her husband, who married her afther me brother died, towld her it ud be just as chape to go down there and get well, and be able to take in washin' like she used to, as to stay here and be dyin' for nobody knows how long. And Mrs. McGee she offered to board him for two dollars a week till his wife come home, all for the love she bore Mrs. Follory. But niver an inch would Mrs. Follory budge. Then her frinds and relations, they put their heads together, and they says, 'She's got to go!' And, all unbeknownst to her, Mike he bought her a ticket in a ship that was sailin' for Cuby. And then he says to her, 'If you won't go to the West Injees to get back your lungs, perhaps you won't moind takin' a sail on the bay with me and Mr. Roon,' which is me, mum. And she didn't moind, and she wint. And when she got outside the bar the ship joggled her a good deal, and Mr. Follory and me we towld her she'd better go down-stairs and lie down till the ship turned roond to coom back, which she did. Then me and Mr. Follory we got into the poilot-boat and coom home. And Mrs. Follory she got sicker and sicker till she died on the second day of the v'yage. But it was saysickness she died of, mum, and not consumption. She'd got well of that if she'd only once set foot in Cuby. And Mr. Follory he married Mrs. McGee. So you see, mum, there's a way for makin' people do things for their own good, as won't do 'em without bein' made. And if I was you, mum, I'd go to my son, mum, and I'd say, 'John, Mr. Roon, as keeps the apple-stand, has just towld me that there's a stamer down the East River that's goin' to sail for some of them down south places this afternoon, which the steward of brings bananas to Mr. Roon every thrip; and if I was you, I'd go down south in that stamer and buy a lot of chape cabbages and pittaties, and coom back and foind the waiters all workin' paceable in their jackets, and sell the pittaties and cabbages to the boss.'"

"That would be very nice," said Mrs. People, throwing away the core of her apple, "but I wouldn't want my son John to die in two days of seasickness. And I don't believe he'd go, anyway. But I must hurry on, Mr. Roon. I am much obliged to you for your story, though it's a great pity that your sister-in-law died, and everybody in the kitchen may be boycotted by this time, for all I know."

"Ye need niver be afraid of your son dyin' with saysickness," shouted Dennis after her, "for he's got a moighty different koind of a set-up from what Mrs. Follory had."

When Mrs. People reached Vatoldi's she did not immediately see John, but she explained to Enoch her delay by recounting to him, with all its details, her conversation with Mr. Roon.

Somewhat to her surprise, Mr. Bullripple listened to her with patience, and even interest, and when she had finished said: "Now don't say a word to John about this till you and me has had time to talk the matter over a little more. I've got to go now to attend to some things outside."

Thereupon Mrs. People betook herself to the kitchen, and Mr. Bullripple went to see Dennis Roon, with whom he had an earnest talk.

"Now, look here, sir," said Mr. Roon, after listening attentively to some remarks from the old man, "that sort of thing moight do very well wid Mrs. Follory, wid most of her lungs gone, but it's altogether another piece of business wid a sthout young mon like Misther People. I can stand on me own legs as well as the nixt mon, but I'm the feyther uv a fam'ly, and I don't want me head cracked, even if I am the top mon in the ind."

"Don't you trouble yourself about that," said Mr. Bullripple. "When my nephew comes back he'll find himself better off than he ever was before in his life, and instead of fighting anybody, he'll want to shake hands all round and stand treat."

"It moight be for his good," said Dennis, "to take a thrip loike that, and git acquainted wid the chape cabbage and pittaty men."

"It'll be for his good in a lot of ways," said Enoch. "You don't suppose his mother and me would be wantin' to send him away if it wasn't for his good. Now, if you'll attend to this business for me, we'll just give you the thanks of the whole family, and I'll throw in five dollars besides. And, if you have to spend anything, I'll pay it back to you."

"All roight, sir! all roight!" exclaimed Dennis, vigorously changing the positions of a dozen large apples which stood in a row. "I'm not the mon to back down from sarvin' a whole fam'ly in disthress. You sind him to me, sir, and I'll fix it all sthaight. I don't ask fur me foive dollars nayther, but I won't be mane enough to run agin the intherests of me own children, and the clothes they could buy for the money."

When Enoch Bullripple got back to Vatoldi's he found his nephew John in a very bad humor. A produce dealer who had long served him with vegetables had been influ-

enced by the boycotters to decline to furnish Vatoldi's with any further supplies in his line until the demands of the waiters had been complied with. This action on the part of the dealer, to whom Vatoldi's had been a most excellent customer, so enraged John that he vowed that under no circumstances would he ever again buy anything from that man. It was, therefore, with a wrathful independence of spirit that he listened to his uncle's statement that the man who kept the apple-stand two blocks below would be glad to make him acquainted with the steward of the steamer which was to sail that afternoon, who would, no doubt, make a contract with him to bring him from the South all the vegetables he wanted, and a great deal better ones, and cheaper than he could get them here.

When Mr. Bullripple had said this, he said no more, but went about his duties, and John went about his own. But at noon John put on his hat, and leaving the establishment, at which few luncheon-desiring customers had yet arrived, to the care of his uncle, he went out to see the apple-man.

Dennis Roon was very eloquent in regard to the subject of obtaining early vegetables direct from the South. John listened attentively, but did not say much in reply. He was not as angry as he had been, but he was still determined to free himself from the power of the dealers in vegetables. If one could be influenced by the boycotters, so might the others.

"I'll tell ye, Misther People," said Dennis Roon, "what I'll do fur ye. I'll go down to that stamer wid ye, and inthroduce ye to the steward. He's a foine eye for bananas, and all he knows about thim he knows about termaties and swate pittaties. If he can't fetch ye thim things himself, he'll make a contrhact for ye with thim as can sind 'em. Now, whin can ye go down to the pier wid me?"

John replied that he could go between three and four o'clock that afternoon, that being the time when he had most leisure. Having made these arrangements, he went back to Vatoldi's, perceiving as he neared the door that the sidewalks had been freshly sprinkled with the boycotters' circulars, which many passers-by were picking up and reading.

When John went to the bank that afternoon, his report to Mr. Stull, combined with that gentleman's own observations during the day, might have been expected to produce a depressing effect upon the mind of the proprietor of Vatoldi's. But the mind of Mr. Stull was not to be thus depressed. As a thoroughly equipped restaurant-keeper, engaged in combat with a host of recusant em-

ployees, his abilities shone at their brightest. The business at Vatoldi's was demoralized in every branch; many of the regular customers kept away, not only on account of the present inferior service, but for fear of disturbance; and, although the tables at some hours were moderately well filled, it was by people who were brought there by curiosity, or by a desire to assist the oppressed. These were not the patrons Mr. Stull wanted, for he knew that Vatoldi's could only be supported by customers who came there for their own good. Most of the new waiters were unpracticed and inefficient, and, worse than that, several had left the night before, being frightened by the boycotters, and there was danger that the whole force might decamp at any moment. But the soul of Mr. Stull rose grandly above this storm. He assured John that he would never give in to the demands of the rascals, and that no coat-tail should ever profane his establishment.

"If I could come forward in my own proper person," he said, raising his tall and large-boned figure to its greatest height, "which, as you well know, my present social and business position forbids, I would show those waiters that they were running against a wall of rock when they ran against me. But as I cannot do this, I expect you to stand up in my place."

Thereupon Mr. Stull loaded his manager with injunctions and directions. He instructed him in the methods by which Mr. Bullripple and Mrs. People could be made even more useful than they now were. He approved of efforts to obtain direct supplies of Southern products. And he poured into John's mind more points of restaurant management, joined with defense against boycotters, than that receptacle could well contain.

As John went away to keep his appointment with the apple-man, he took off his hat and walked with it in his hand; his head required cooling. Dennis was ready for him, and the two took a street-car for the pier. John noticed that his companion carried in his hand a cheap but new valise, well filled; but, not being in the habit of asking questions about the business of other people, he did not allude to it.

On reaching the steamer they found it a scene of great activity; and when they went on board, Dennis left his companion and hurried forward. In a few moments he returned, and said to John: "By Jarge, sir, they're jist a-goin' to stharta! But the steward he tills me that if we'd loike to take a little trip doon the bay, and coom back with the poilot, he'll have toime to talk wid ye about the vigtibles, which he says he can git ye by

the cart-load three times a week, and as chape as the dirt they grow in."

"But won't we be charged for such a trip?" asked John.

"And do ye s'pose ye'd be expected to pay for a small sail like that whin ye'r just takin' it to make a contrhact wid one of the ship's officers? Bedad, sir, there'll be none of that!"

In the present condition of his brow and his body, John was very willing to refresh himself with a trip down the bay; and, although he did not think he could very well spare the time, his inclinations, combined with what he believed to be a duty, induced him to agree to the apple-man's proposal.

There were very few passengers going South at that time of year, and John had the after-deck all to himself. When the steamer started, Mr. Roon's expressions of delight at the pleasures of the excursion were vehement and frequent.

"Even if ye niver buy so much as a pittaty skin, this thrip will be worth the little throuble ye took to git it by manes of its fillin' yer lungs wid say-air, and settin' you up sthrong agin for your work."

Every ten or fifteen minutes this worthy Irishman went forward to see if the time had come for John's business to be attended to, but always returned saying that the steward was very busy, but that he would see Mr. People in plenty of time.

"How far do they go out before the pilot leaves them?" asked John, who knew very little of marine affairs.

"Oh, a long ways," answered Dennis, "for they've got to git clane clare of all the sand-bars afore they let go uv him. And ye needn't be afraid that me, the feyther of a fam'ly that's expectin' me to coom home to supper, and thin be off to the stand to let Pat coom and git his, is goin to be lift. I've tried this thing afore, Mr. People, and I'm not the mon to git lift by the poilot."

The water was beginning to be pretty rough, and the sea-breeze very fresh, when Dennis came to John and informed him that the steward was ready now to see him, and would he come down-stairs?

John had so much enjoyed the unaccustomed pleasure of this water excursion that he had almost forgotten that there were such things as cabbages and potatoes; and when he followed Dennis below he did not notice that the engine had stopped, and that the speed of the steamer was slacking.

"Jist set down there," said Dennis, "and I'll fetch him in a minute."

And then the apple-man hurried on deck, descended into the pilot-boat, and returned to New York.

The report of Mr. Roon was eagerly listened to by Enoch Bullripple. "And you gave my letter, with the ticket in it, to somebody to hand to him, and you put his valise in the room that I engaged for him?"

"Yis," said Dennis, "I did all of thim things, and I put two apples on his bid to re-moind him of home. He'll be a happy mon, Mr. Bullripple, to-morrow and the nixt day, a v'yagin' over the peaceful say; and coom back sthrong and hearty, and ready to let you and his lady mither go back to yer home in the rural disthriacts. And I give the poilot a dollar, and me car-fare was tin cints."

VIII.

THE Saturday and Sunday on which Mr. Crisman chose to join a yachting excursion, instead of making the visit to Cherry Bridge which had been expected of him, were two of the most charming days of June; and, although Mrs. Justin remarked several times that it was a great pity Mr. Crisman could not be with them in this lovely weather, she was obliged to admit that such weather must also be very delightful on the water. Miss Gay made no remarks concerning Mr. Crisman's absence, but she seemed to be doing a great deal of thinking, either on this subject or some other. As for Mr. Stratford, it could not have made much difference to him whether or not Mr. Crisman was there on the Saturday, for he spent the greater part of that day in writing letters.

Shortly after breakfast Miss Gay went into the parlor with some books, and after remaining there for a quarter of an hour or more she went out on the piazza, where she ensconced herself comfortably in a large arm-chair to read. She did not stay there very long, however, but returned to the parlor, which, after all, was perhaps a more secluded place at this hour, and better adapted to purposes of study. The household affairs to which Mrs. Justin attended, and the long conversation she afterwards had with her farmer, could have been attended to and carried on as well upon a rainy day as during this beautiful morning; and it may therefore be said that Mr. Thorne was the only one of the little party who thoroughly enjoyed the atmosphere of sunshine, tempered by the morning breezes, which threw its yellow light into the dark-green tones of the dew-besprinkled grass and upon the fresh new foliage of the trees, and who breathed with full appreciation the blossom-scented air.

He breathed this air on the lawn, where the dewy grass dampened his boots; and then he breathed it on the piazza, where for

twenty minutes or more he walked steadily up and down. Then he looked into the library, where Stratford was writing, and after that he went into the parlor, and seeing Miss Gay there, he said that he hoped he was not interrupting her studies. Miss Gay laid the book in her lap, and said she was not studying, but reading. Mr. Thorne took up one of Miss Gay's books which lay on the table and asked if its subject was a new study, or whether she had been engaged upon it while in college. The answer to this question led to a number of inquiries from Mr. Thorne in regard to the young lady's past studies and future intentions in that line. This was a subject in which he took a deep and intelligent interest, and it was impossible that Gay should not also take an interest in the conversation which followed; but, although she talked with willingness, and even with some earnestness, her mind frequently wandered from the subject in hand. She felt that this was what might be considered a temporary conversation carried on while expecting something else. But she listened and talked as well and as pleasantly as she could until Mrs. Justin came into the room, when indeed a faint shadow of disappointment passed over her face as she looked up and saw that it was Mrs. Justin.

The rector of the parish, with Miss Patty, his seventeen-year-old daughter, came to dinner. But shortly after that meal he drove away to make another parochial visit, leaving Miss Patty, at Mrs. Justin's solicitation, to be picked up on his return. A four-handed game of croquet was now possible, notwithstanding Mr. Stratford had driven over to the Bullripple farm. As Miss Patty was a mere beginner at the game, which had scarcely been played at all during her school-days, it was necessary that Mrs. Justin, being the best player of the party, should take her as a partner.

Miss Armatt had no reason whatever to object to Mr. Thorne as a partner, but she did not seem to care very much for croquet that afternoon. Mr. Thorne assisted her in every possible legitimate way, but he did not direct her course and manage her play as Mr. Stratford had done. Gay, indeed, did not appear to desire this, and developed a certain degree of independence which had not been at all observable when she played before. She went through her wickets as rapidly as possible, and ended in becoming a rover before her partner had reached the turning-stake. This was a very different style of play from that upon which Mr. Stratford had so pleasantly and wisely insisted, and the result was that Mrs. Justin and Patty, by keeping their balls together, won the game, although their progress to victory, owing to the uncer-

tain play of the younger lady, was very slow and dubious.

Mr. Thorne accompanied the ladies to church the next morning; and in the afternoon the four friends set out for a long stroll over the fields and hills. With the natural bias of the younger man towards the younger lady of a party, Arthur Thorne walked with Miss Gay, following the other couple quite closely, however, as Mrs. Justin seemed desirous of a general chat as they strolled along. Gay was not in very animated spirits, and, in fact, seemed a little bored by the walk; and this, being soon noticed by Mrs. Justin, was not altogether displeasing to that lady. She had not forgiven Mr. Crisman for preferring a yachting expedition to the society of his lady-love, but she believed it due to propriety that, in some degree, Gay should feel his absence.

When they began the ascent of a long grass-covered hill, which in some parts of the country would be termed a little mountain, the party scattered somewhat, and Gay, who was very light of foot, soon found herself in the lead. Stratford, however, who was also a good uphill walker, overtook her before very long, and the two continued their way together. About this time, probably owing to the altitude of the hill and the slightly increased rarefaction of the air, Gay's spirits began to rise, and she talked in quite an animated way about the distant scenery which now showed itself. She still pressed vigorously onward and upward, Stratford keeping pace with her; and the two, without knowing that they were leaving their companions out of sight, passed over the brow of the hill and down a slight declivity on the other side, towards an extensive grove of sugar-maples, which was one of the objects of their walk. They reached the grove and passed some distance into its shade, and then they rested and waited for their companions. These not making their appearance, Stratford and Miss Gay walked slowly along one of the winding wood-roads which led them through the grove, and out upon an eminence, surmounted by a rail fence which formed part of the boundary between Mrs. Justin's estate and that of her neighbor.

This eminence, Stratford assured his companion, was one of the best spots in that part of the country from which to view the approaching sunset, and here he proposed they should wait for Mrs. Justin and Mr. Thorne. One of the top rails of the fence was very broad and firm, and as Gay was rather tired from her climb and walk, Stratford assisted her to take a seat upon it; and the rail being quite strong enough to support them both, he sat upon it also.

The sun, with its accustomed regularity of movement, slowly went down, but Mrs. Justin and Thorne did not come up. Gay wondered at their delay, but she soon forgot them in gazing upon the glories of yellow, red, and gold which began to spread over the western sky, reaching upward from the tender green which lay along the horizon to the pink flush which, half way towards the zenith, met the deep overhanging blue.

No such scene as this was ever visible from the lower country by Cherry Bridge, and Gay sat and looked upon it as if it had been a revelation. Beautiful cloud-forms glowed in this rich color and in that, and faded away, through lilac and pink, to rose-tinted gray, and out of the vast ether came other outlines of clouds, to be delicately tinted and to fade away.

The evening star began to twinkle through the dull golden mists, when Stratford stepped down from the fence, and, saying that he did not believe that the others were coming at all, proposed to Miss Gay that they should return to the house.

With one lingering look above and around her, Gay gave her hand to her companion and sprang from the fence. They walked rapidly down towards the maple grove, and when they reached it they found that although the sky was still glowing with light, the shades of the grove were shades indeed. It was so dark that Gay was very much surprised, and she declared that if she had been alone it would have been utterly impossible for her to find her way along that indistinguishable wood-road. But she was not alone, and Mr. Stratford knew the road well, having walked it by day and by night. It was necessary that she should take his arm to avoid tripping over unseen obstacles, and they walked slowly. Gay was not the least afraid, and her eyes becoming accustomed to the gloom of the grove, she was almost as much entranced by its weird and somber beauties as she had been by the glories of the sunset.

Even when they came out of the woods and walked under the open sky, they could not hasten, for the shades of night were now upon them, and a misstep on the hill-side might prove unpleasant. Slowly they strolled homeward under the points of starlight that began to twinkle above them, and Stratford for the most part talked, and Gay for the most part listened; and whatever feelings of impatience, or disappointment, or boredom she may have had during that day, or the one preceding, now disappeared altogether.

It was quite dark when they walked over the lawn towards the house, but Gay felt no compunctions of conscience at having staid

out so late. She had been with Mr. Stratford, and that fact, to her mind, gave to the proceeding all the sanction that it needed.

Mrs. Justin and Arthur Thorne had taken a path through the maple grove which led them to a point from which the rail fence where Stratford and Miss Gay had seated themselves was not visible. Seeing nothing of their companions, they returned the way they came, and reached the house about the time that the sunset began to fade.

When Miss Gay and Stratford arrived, Mrs. Justin made no remarks concerning the lateness of the hour, for she did not consider that she had a right to scold grown-up people, one of whom was engaged to be married. But she remembered that when Mr. Crisman and Gay had walked together, they had not kept supper waiting.

The next day Mr. Thorne returned to the city, and exchanged the hues of forest and field for the lugubrious colors of his apartments. But into the midst of those dull greens and yellows, those clay-reds and weak blues, he brought the delicate flush on a young girl's cheek, the deep blue of her large eyes, the pink of her lips, and the sunny brownness of her hair. As he meditatively leaned back against the long thin rods which formed the back of his antique chair, these colors were very forcibly brought out by the somber propriety of his surroundings.

After breakfast on that morning Miss Gay did not wander from parlor to piazza to find a suitable place in which to pursue her studies. She carried the ancient atlas and the books directly to the place where she had last looked over them with Mr. Stratford, and in ten minutes he came there and joined her. The atlas and the books were opened, and again they followed the meandering streams of the springs of literature. It was not very long before Mrs. Justin made one of the party, and she interested herself to a considerable degree in their investigations; but household affairs interfered with the permanence of her stay, and Gay was able to appreciate the immense advantages of study and companionship with a kindly sympathetic though dominant mind over the lonely journeys which she had often made into the region of intellectual investigation.

During the next five days Mrs. People was still absent from the Bullripple farm, and Mr. Stratford remained at the mansion of Mrs. Justin. On any of these days, when Mrs. Justin had the company of either Stratford or Gay, she generally had that of both of them. Sometimes she did not find them at all, for they seemed to be subject to sudden determinations to row or stroll. They did not

treat her discourteously on these occasions, for they invariably asked her to accompany them if she were anywhere about; but it was astonishing to herself how seldom she happened to be about at the right moment for an invitation.

At last Mrs. Justin could endure this state of things no longer, and determined to speak. It was not necessary to ask anything of Gay, for the estimation in which that young lady held Mr. Stratford not only grew and brightened, as the day grows and brightens after the rising of the sun, but was just as clear and apparent to Mrs. Justin as any light of day could be. Against the brightness of this esteem there never rose a cloud of obscuring vapor from the Crismanic fires which Mrs. Justin firmly believed still glowed deep down in the soul of Gay Armatt. This absence of even transient obscuration troubled much the mind of Mrs. Justin, for even the fires of the strongest volcano must go out if the vents are permanently stopped.

As it was not needed to question Gay, who spoke so often and so freely of Mr. Stratford, it would be also a very delicate and difficult matter to advise her; and it was for these reasons that Mrs. Justin decided to speak to Stratford. She would have a plain talk with him, and tell him all her mind. With this object she invited him to drive her to the village in his buggy. For an earnest tête-à-tête there are few places better than a buggy. Interruption is scarcely probable unless a wheel comes off.

When they were well on the road, Mrs. Justin plunged into the subject. "Do you appreciate," she said, "the influence which your constant companionship is having upon Gay Armatt?"

"What is the influence?" asked Stratford.

"It is the influence of a man who completely absorbs the attention and interest of a young woman. I believe that when Gay is not reading, or walking, or talking with you, she mentally places you before her so that she can follow you in her thoughts. I know that she does that when she is with me, for she is satisfied to talk of nothing but you. I believe at this moment she thinks more of you, and better of you, than of any man in the world."

"And of this you do not approve," he said, "there being no just foundation for such an opinion?"

"On the contrary," said Mrs. Justin vehemently, "there is so much foundation that I have sometimes almost wished that you could be suddenly turned into the most ordinary of men. It is the fact that you do possess those qualities which must attract the admira-

tion and regard of a girl like Gay, that gives you your influence over her."

"And why should not that influence be exerted?" asked Stratford.

"You know very well," was the quick answer. "If this influence does not cease, it will end in the complete alienation of Mr. Crisman and Gay Armatt."

"And that," said Stratford, "is exactly what I want to bring about."

Mrs. Justin started, and turning suddenly towards her companion, she looked at him with wide-open eyes, but said not a word.

"You have spoken plainly to me, Mrs. Justin," continued Stratford, "and I am going to speak quite as plainly to you. I consider Gay Armatt a phenomenally fine girl. From what you had told me, I expected to find her a most interesting student, but I did not expect to find her an independent thinker, with a sensitive susceptibility to inspirations such as I have not known before, and a mind as fine and noble as the objects it fixes itself upon. I had scarcely known this girl before I found out that she was engaged to be married to a man who was utterly unworthy of her and unfit for her, and whose union with her would put an end to all her purposes and aspirations, and finish by degrading her, as nearly as such a thing is possible, to his level."

"I do not believe it!" exclaimed Mrs. Justin. "She would elevate him."

"Excuse me," said Stratford, "but you are entirely wrong. He is not capable of being elevated; and if he were, he has no desire to be elevated. His marriage with Gay Armatt would put an absolute end to what we now look upon as her career. I know this, and I do not see how you can help knowing it."

"I must admit," said Mrs. Justin, "that I have feared this, and that I have spent hours in thinking about it. But I have a better opinion of Mr. Crisman than you have; I have more faith in Gay than you have; and I trust to her power over him. But this should not be the question. Gay has promised Mr. Crisman to marry him, and, to my mind, this is just the same as if these two persons were already married. To do anything which would induce her to break this engagement is positively and dreadfully wicked."

"I cannot agree with you," said Stratford. "An engagement is not the same as a marriage."

"Mr. Stratford," said Mrs. Justin, "it is of no use for us to argue this question. All that we should consider is that these two young people love each other and desire to be man and wife; and you have no right to come between them."

"How did Miss Armatt happen to be engaged to Crisman?" asked Stratford. "Was he not her first lover?"

"Yes," said Mrs. Justin; "the first and only one."

"I thought so," he said, "and that explains the situation exactly. As I said before, she is a girl of sensitive susceptibility; he is the first handsome young fellow who made love to her, and she accepted him. In some respects her character is unformed, but she ought not to be made to suffer on that account."

"Your kindly disposition is as phenomenal as Gay's mind," said Mrs. Justin.

Stratford made no answer to this, nor did he smile. "Mrs. Justin," he said, "you have helped this young girl to become what she is, and have put her in a position from which she can go on, and take her place among the eminent men and women of her day. Now, I am going to save her from losing all you gave her. You expect her to become one of the brightest jewels in your crown. I intend to prevent her from dropping from that crown and being trampled in the mud."

"Do you mean to say," said Mrs. Justin, "that you deliberately intend to break off this engagement?"

"If it shall be possible," said Stratford, "I intend to alienate Miss Armatt's affections from Crisman by making her understand the value of the companionship of better men than he is. I do not hesitate to say that I consider myself a much better man than he is."

"A noble undertaking!" exclaimed Mrs. Justin. "And when you have made her cast him off, you will kindly marry her yourself!"

"I shall do nothing of the sort," said Stratford. "I knew you would think that, and perhaps say it, but you are mistaken. Positively, I shall not marry her."

"And what will you do with her," asked Mrs. Justin, "when you have torn her affections from her lover, and fixed them on yourself? Will you cast her, heart-broken, out upon the world?"

"Your language is very strong, Mrs. Justin, and you do injustice to my motives. Miss Armatt is not one to be thrown out on the world, as you put it. She is a young woman whom to win would be an ambition worthy the best man of our day. Once freed from this absolutely unsuitable engagement, into which she entered because her young soul knew so little about men, she will be free to marry a man who is worthy of her, and there is no danger but that man will appear."

"But," said Mrs. Justin, "it is not to be supposed that he will appear instantly. It may be a year or two before she meets the man you

think she ought to marry. Is she to be left unprotected from other Crismans all this time? Or do you intend to carry her over the gap?"

"I shall carry her over the gap," said Stratford.

Mrs. Justin laughed outright, but not in merriment. "What an utter piece of absurdity!" she exclaimed. "Why, Mr. Stratford," she added with much earnestness, "don't you know enough of men's hearts and women's hearts to understand that if you should win Gay from Crisman, and then desire to give her up to another man, which I don't in the least believe you would desire, that you couldn't do it? Can't you see, as plainly as you see the road before you, that Gay's affections would by that time be so firmly fixed upon you that she would not be given up? Giving up would be impossible for either of you. Now, don't you think you will be much more true to yourself, should you determine to persevere in carrying out this plan, which I call an iniquitous one, frankly to admit that if you get Gay Armatt away from Mr. Crisman, you will marry her yourself?"

"I intend to carry out my plan," said Stratford, "and I shall not marry Miss Armatt."

"Stuff and nonsense!" exclaimed Mrs. Justin. And as they were now entering the village, the conversation ceased.

As they were driving homeward, Stratford said: "You know very well, Mrs. Justin, that I have the highest possible regard for what you think and say; but, in this case, even your opinion cannot turn me from my determination to save this young girl, if I can, and give her a chance to make her life what it ought to be. But, now that I know that you disapprove of what I am doing, I do not think it is right that I should remain at your house. But you must not suppose that I am going away with any feeling of resentment. I know you so well that nothing you have said surprises me; and, indeed, looking upon you as yourself, I am not sure that I should be satisfied that you should entertain any opinions on this matter other than those you have expressed to me."

"I might have expressed them more gently," said she; "but, indeed, Mr. Stratford, this is a matter which I feel very deeply. I suppose, of course, that, remembering what you have said, I ought not to wish you to stay with us while Gay is here, but it is to me one of the saddest features of the whole affair that there should be any objection to your staying in my house."

"I thank you most kindly for that," said Stratford.

"But you can't go to the farm-house," she said. "Mrs. People has not returned, and there is no one to take care of you."

"Oh, I shall do very well," said he. "Now that Thorne has gone, I shall not mind being there without Mrs. People. But I suppose she will return in a few days; and, in any case, I shall make a visit to the city next week."

Nothing was said for some minutes, and then Mrs. Justin exclaimed: "I do wish, Mr. Stratford, that you could see this affair as I see it! If you could, I am sure you would instantly abandon your purpose."

"How different we are," said Stratford. "I hope, and what is more, I expect, that the day will come when you will say, although you may not even then believe that my methods were proper, that their result has been most happy."

"You may think," said Mrs. Justin, "and you have reason for it, that you are a man who is never turned from his purpose. You may be very steadfast in your present purpose of merely carrying Gay over that gap, but you will be turned from it."

"By whom?" asked Stratford.

"By Gay. You will marry her."

WHEN Mr. Stratford took leave of the ladies that afternoon, Gay Armatt did not feel so sorry as she would have felt if she had not known that Mr. Crisman was coming in the evening train. She was a woman now, and all sorts of young and half-fledged sentiments were fluttering into her soul, some flying restlessly about and then out again, and some settling first here and then there, as if very uncertain whether they ought to stay or not. But one little sentiment nestled down as if it felt itself at home, and it made Gay feel that while Mr. Crisman was with her it was just as well that Mr. Stratford should be away. There was no reason connected with this sentiment. It was nothing but a little partly-feathered thing that did not know itself where it had come from. It found Gay's soul a very quiet and pleasant place in which to nestle, for the young lady did not know that Mr. Stratford was not coming to the house again while she was there.

(To be continued.)

SHE CAME AND WENT.

SHE came and went, as comes and goes
 The dewdrop on the morning rose,
 Or as the tender lights that die
 At shut of day along the sky.
 Her coming made the dawn more bright,
 Her going brought the somber night;
 Her coming made the blossoms shine,
 Her going made them droop and pine.
 Where'er her twinkling feet did pass,
 Beneath them greener grew the grass;
 The song-birds ruffled their small throats
 To swell for her their blithest notes.
 But when she went, the blushing day
 Sank into silence chill and gray,
 The dark its sable vans unfurled,
 And sudden night possessed the world.
 O fond desires that wake in vain!
 She ne'er will come to us again;
 And now, like vanished perfume sweet,
 Her memory grows more vague and fleet.
 Yet we rejoice that morn by morn
 The sad old world seems less forlorn,
 Since once so bright a vision came
 To touch our lives with heavenly flame,
 And show to our bewildered eyes
 What beauty dwells in paradise.

James B. Kenyon.

COQUELIN.

I was nearly seventeen years ago, and the first time that the writer of these remarks had taken his seat in that temple of the drama in which he was destined afterwards to spend so many delightful evenings, to feel the solicitation of so many interesting problems, and to receive so many fine impressions, foremost among which was this, that the Théâtre Français was a school for the education of the taste. It seemed to the spectator of whom I speak that the education of his own dramatic taste began on the evening he saw M. Coquelin play a part—doubtless of rather limited opportunity—in “Lions et Renards.” I have seen him play many parts since then, more important, more predestined to success (Émile Augier’s comedy to which I allude was, not undeservedly, a failure), but I have retained a vivid and friendly memory of the occasion, and of this particular actor’s share in it, because it was the first step in an initiation. It opened a door, through which I was in future to pass as often as possible, into a world of fruitful, delightful art. M. Coquelin has quitted the Comédie Française, his long connection with that august institution has come to an end, and he is to present himself in America not as a representative of the richest theatrical tradition in the world, but as an independent and enterprising genius who has felt the need of the margin and elbow-room, the lighter, fresher air of a stage of his own. He will find this stage in the United States as long as he looks for it, and an old admirer may hope that he will look for it often and make it the scene of new experiments and new triumphs. M. Coquelin’s visit to America is, in fact, in itself a new experiment, the result of which cannot fail to be interesting to those who consider with attention the evolution of taste in our great and lively country. If it should be largely and strikingly successful, that sacred cause will beyond controversy have scored heavily. Foreign performers, lyric and dramatic, have descended upon our shores by the thousand and have encountered a various fortune. Many have failed, but of those who have succeeded it is safe to say that they have done so for reasons which lay pretty well on the surface. They have addressed us in tongues that were alien, and to most of us incomprehensible, but

there was usually something in them that operated as a bribe to favor. The peculiarity of M. Coquelin’s position, and the cause of the curiosity with which we shall have regarded the attitude of the public towards him, is in the fact that he offers no bribe whatever—none of the lures of youth or beauty or sex, or of an insinuating aspect, or of those that reside in a familiar domestic repertory. It is a question simply of appreciating or not appreciating his admirable talent, his magnificent execution. Great singers speak or rather sing for themselves. Music hath charms, and the savage breast is soothed even when the “words” require an ingenious translation. Distinguished foreign actresses have the prestige of a womanhood which is, at any rate, constructively lovely. Madame Sara Bernhardt was helped to make the French tongue acceptable to the promiscuous public by the fact that, besides being extraordinarily clever, she was also, to many eyes, very beautiful and picturesque, and had wonderful and innumerable gowns. M. Coquelin will have had the same task without the same assistance; he is not beautiful, he is not picturesque, and his clothes scarcely count. The great Salvini has successfully beguiled the American people with the Italian tongue; but he has had the advantage of being very handsome to look upon, of a romantic type, and of representing characters that have on our own stage a consecration, a presumption in their favor. M. Coquelin is not of a romantic type, and everything in him that meets the eye of the spectator would appear to have been formed for the broadest comedy. By a miracle of talent and industry he has forced his physical means to serve him also, and with equal felicity, in comedy that is not broad, but surpassingly delicate, and even in the finest pathetic and tragic effects. But to enjoy the refinement of M. Coquelin’s acting the ear must be as open as the eye, must even be beforehand with it; and if that of the American public learns, or even shows an aptitude for learning, the lesson conveyed in his finest creations, the lesson that acting is an art and that art is style, the gain will have been something more than the sensation of the moment—it will have been an added perception.

In M. Augier’s comedy which I have mentioned, and which was speedily withdrawn, there was frequent reference to the

"robe of innocence" of the young Viscount Adhémar, an interesting pupil of the Jesuits, or at least of the clerical party, who, remarkable for his infant piety and the care taken to fence him in from the corruptions of the town, goes sadly astray on coming up to Paris, and inflicts grievous rents and stains on the garment in question. I well remember the tone of humbugging juvenile contrition in which Coquelin, representing the misguided youth, confessed that it was no longer in a state to be worn. He had a little curly flaxen wig, parted in the middle, and a round, rosy face, and a costume resembling that which in New York to-day is attributed to that elusive animal the dude; yet he was not a figure of farce, but a social product, as lightly touched as he was definitely specified. I thought his companions as delightful as himself, and my friendliness extended even to the horrible stalls in which, in those days, one was condemned to sit, and to the thick, hot atmosphere of the house. I suspect the atmosphere has never been lightened since then, and that the Théâtre Français has never had a thorough airing; but certain alleviations have been introduced; new chairs and wide passages, and frescoes on the ceilings, and fresh upholstery on box and balcony. It is still, however, of the dingy and stuffy old theater that I think, haunted as it then was more sensibly by the ghosts of the great players of the past—the mighty shades of Talma and Mars and Rachel. It has seemed to me ever since that the "improvements" have frightened them away; the ancient discomforts were a part of the tradition—a word which represents the very soul of the Comédie Française, and which, under the great dim roof which has echoed to so many thrilling sounds, one pronounces with bated breath. The tradition was at that time in the keeping of MM. Régnier, Bressant, Delaunay, and Got, of Mesdames Plessy, Natalie, and Favart, to say nothing of the subject of this sketch, the latest comer in the great generation of which these were some of the principal figures. Much has been changed since then, and M. Coquelin, though still in the prime of life, was the other day almost a senior. Régnier, Bressant, Delaunay have disappeared, and from the boards of the Théâtre Français the most robust depository of the tradition in the younger line—for to this title Coquelin certainly has a right—has also vanished. Gone is the brilliant, artificial, incomparable Plessy; gone is that rich and wise comédienne, the admirable, elderly, humorous, discreet, and touching Natalie; gone is poor Madame Favart, whose utterance I remember I couldn't understand the first time I heard her (she was still playing young girls, and

represented, in a very tight dress, the aristocratic heroine of "Lions et Renards"), but whom I afterwards grew to admire as an actress of high courage and a great tragic gift.

It took a certain time for a new spectator to discriminate and compare, to see things, or rather to see persons, in the right proportion and perspective. I remember that the first evenings I spent in the Rue de Richelieu I thought every one equally good, I was dazzled by the universal finish, by an element of control which at that time seemed to me supreme. Every one *was* good,—I don't say that every one is to-day,—but afterwards the new spectator perceived differences. He even discovered that, such is the grossness intermingled with even the noblest human institutions, there is sometimes a failure of taste behind that stately *rampe*. He has heard common voices there, he has seen the dead letter of the famous tradition uninformed by a spirit. He has seen gentlemen put down their hats with great accuracy on the first chair on the right of the door as they come in, but do very little more than that. He has seen actresses to whom all the arts of the toilet, all the facility of the Frenchwoman, and all the interest they had in producing an illusion could not impart the physiognomy of a lady. These little roughnesses, however, inherent, as I say, in every mundane enterprise, were not frequent, and the general glamour lasted a long time. I am nevertheless pleased to believe to-day that (if I do not deceive myself) even at the very first I dimly discerned that the essence of the matter, the purest portions of the actor's art, abode in this young Coquelin—he was then young—with an unsurpassable intensity. Benoît-Constant Coquelin was born at Boulogne-sur-Mer in 1841; his vocation defined itself at a very early age, and he became a pupil of the Conservatoire in 1859. From this nursery of histrionic hopes he entered the Comédie Française, where he immediately made his presence perceived. At the age of twenty-three he was a *sociétaire* of the great house. His cast of countenance, his features, the extraordinary metallic ring of his voice, marked him out for parts of extreme comic effort and of what is called character. Long before I had seen him I remember a friend's exciting—in a letter—my interest in his acting of Théodore de Banville's touching and picturesque little play of "Gringoire," where, in the part of a mediæval Bohemian of letters, condemned to be hanged by Louis XI. and reprieved when the halter is already around his neck (I have not seen the piece for a long time, and forget the exact argument), he gave occasion to that amiable interfusion of smiles and tears to which a

French audience is so much inclined. "Gringoire" is an exquisite creation, which has taken its place in M. Coquelin's permanent repertory, where he has given it, in comparatively recent times, a companion figure in M. Coppée's "Luthier de Crémone," a sensitive, slightly morbid personage, represented by the actor with extreme discretion and genuine poetical feeling, and dear to the French public from the fact that he may be introduced to families and young ladies. The pathetic, the "interesting" (including, where need be, the romantic and even the heroic), and the extravagantly droll represent the two opposite ends of M. Coquelin's large gamut. He turns from one to the other, he ranges between them, with incomparable freedom and ease. Into the *emploi* of the impudent, extravagant serving-men of the old comedies,—the *Mascarilles*, the *Scapins*, the *Frontins*, the *Crispins*,—he stepped from the first with the assurance of a conqueror; from hand to foot, in face, in manner, in voice, in genius, he was cut out for them, and it is with his most successful efforts in this line that, for the public at large, his name has become synonymous. If his portrait is painted (perhaps it has been) for the *foyer* of the Comédie Française, it should be as the *Mascarille* of Molière's "L'Étourdi."

I have an impression that this was the second part I saw him play, with Delaunay as the scatterbrained hero. Coquelin was dressed like a figure of the old Italian comedy, in great stripes of crimson and white, a little round cloak, a queer, inflated-looking cap, and breeches and hose of the same pattern. I can see him, I can hear him, the incarnation of humorous effrontery and agility, launching his prodigious voice over the footlights, fairly trumpeting his "points," and giving an unparalleled impression of life and joy. I have seen him in the part many times since then, and it has always seemed to me, with the exception of his astonishing incarnation of the false marquis in the "Précieuses Ridicules" (the valet, who in his master's finery, masquerades as a *bel-esprit*), the most exuberant in his repertory. Of this fantastic exuberance he is a rare master, and his command of it is doubly wonderful when one thinks of his command of effects which lie entirely in self-possession—effects of low tone, as painters say. The representative of *Don Annibal* in "L'Aventurière," of *Don César de Bazan* in "Ruy Blas" (in both of which parts the actor is superb), is also the representative of various prose-talking, subdued gentlemen of to-day (the *Duc de Septmonts*, in "L'Étrangère" of the younger Dumas, the argumentative, didactic *Thouvenin*, in the same author's "Denise") caught in various tight places, as gentlemen must be in a play, but with no ac-

cessories à la *Goya* to help them out. The interpreter of the tragic passion of *Jean Dacier*, which I have not seen for many years, is hidden in the stupendously comical and abject figure of M. Royal, the canting little pettifogger or *clerc d'huissier*, who appears in a single brief scene in the last act of "Tartuffe," and into whom M. Coquelin, taking up the part for the first time in the autumn of 1885, infused an individuality of grotesqueness and baseness which gave him—all in the space of five minutes—one of his greatest triumphs.

The art of composition, in the various cases I have mentioned, is the same, but the subjects to which it is applied have nothing in common. I have heard people enunciate the singular proposition: "Coquelin has great talent—he does ever so many different things; but, I don't know—he is always Coquelin." He is indeed always Coquelin, which is a great mercy, considering what he possibly might have been. It is by being always Coquelin that he is able to be *Jean Dacier* one night and *Don Annibal* another. If it be meant by the remark I have just quoted that he makes *Don Annibal* resemble *Jean Dacier*, or gives the two personages something in common which they could not really have possessed, no criticism could well be less exact. What it really points to, I suppose, is the extreme definiteness and recognizableness, as it were, of the performer's execution, of his physical means, above all, of that voice which no manner of composing a particular character can well render a less astounding organ at one moment than at another. *Don César* is Coquelin and *M. Thouvenin* is Coquelin, because on the lips both of *Don César* and of *M. Thouvenin* there sits a faculty of vocalization, as one may call it, which is peculiar to the artist who embodies them, and surely one of the most marvelous the stage has ever known. It may be said that M. Coquelin's voice betrays him; that he cannot get away from it, and that whatever he does with it one is always reminded that only he can do such things. His voice, in short, perpetually, loudly identifies him. Its life and force are such that the auditor sometimes feels as if it were running away with him—taking a holiday, performing antics and gyrations on its own account. The only reproach it would ever occur to me to make to the possessor of it is that he perhaps occasionally loses the idea while he listens to the sound. But such an organ may well beguile the ear even of him who has toiled to forge and polish it; it is impossible to imagine anything more directly formed for the stage, where the prime necessity of every effort is that it shall "tell." When Coquelin speaks, the sound is not sweet and caressing, though

it adapts itself beautifully, as I have hinted, to effects of gentleness and pathos; it has no analogy with the celebrated and delicious murmur of Delaunay, the enchanting cadences and semitones of that artist, also so accomplished, so perfect. It is not primarily the voice of a lover, or rather (for I hold that any actor—such is the indulgence of the public to this particular sentiment—may be a lover with any voice) it is not primarily, like that of M. Delaunay, the voice of love. There is no reason why it should have been, for the passion of love is not what M. Coquelin has usually had to represent.

He has usually had to represent the passion of impudence, and it is, I think, not too much to say that it is in this portrayal that he has won most of his greatest victories. His expression, his accent, give him the highest commission for placing before us the social quality which, I suppose, most conducts a man to success. The valets of Molière and Regnard are nothing if not impudent; impudent are *Don César* and *Don Annibal*; impudent, heroically impudent, is *Figaro*; impudent (as I remember him) *M. Adolphe de Beaubourg* (in “Paul Forestier”); impudent the *Duc de Septmonts*; impudent even—or at least decidedly impertinent—the copious moralist *M. Thouvenin*. (I have selected simply a handful of instances, out of M. Coquelin’s immense repertory. There are doubtless others at least as much to the point, in parts in which I have not seen him. He is believed, moreover,—and the idea is most natural,—to have aspirations of the most definite character with regard to “*Tartuffe*,” and it may be predicted that on the day he embraces that fine opportunity he will give a supreme sign of his power to depict the unblushing. It need hardly be remarked that the Mephistopheles, which at the moment I write he is rumored to have in his eye, in an arrangement of Goethe’s drama, will abound in the same sense.) If M. Coquelin’s voice is not sweet, it is extraordinarily clear, firm, and ringing, and it has an unsurpassable distinctness, a peculiar power to carry. As I write I seem to hear it ascend like a rocket to the great hushed dome of the theater of the Rue de Richelieu. It vibrates, it lashes the air, it seems to proceed from some mechanism still more scientific than the human throat. In the great cumulative tirades of the old comedy, the difficulties of which are pure sport for M. Coquelin, it flings down the words, the verses, as a gamester precipitated by a run of luck flings louis d’or upon the table. I am not sure that the most perfect piece of acting that I have seen him achieve is not a prose character, but it is certain that to appreciate to the

full what is most masterly in his form one must listen to and enjoy his delivery of verse. That firmness touched with hardness, that easy confidence which is only the product of the most determined study, shine forth in proportion as the problem becomes complicated. It does not, indeed, as a general thing, become so psychologically in the old rhymed parts; but in these parts the question of elocution, of diction, or even simply the question of breath, bristles both with opportunities and with dangers. Perhaps it would be most exact to say that wherever M. Coquelin has a very long and composite speech to utter, be it verse or prose, there one gets the cream of his talent. The longest speech in the French drama, not excepting the famous soliloquy of *Figaro* in the second comedy of Beaumarchais, and that of *Charles V.* in “*Hernani*,” is, I should suppose, the discourse placed in the mouth of *M. Thouvenin* aforesaid in the last act of “*Denise*.” It occupies nearly four close pages in the octavo edition of the play, and if it is not a soliloquy it is a sermon, a homily, a treatise. An English or an American audience would have sunk into a settled gloom by the time the long rhythm of the thing had declared itself, and even at the Théâtre Français the presumption was against the actor’s ability to bring safely into port a vessel drawing such a prodigious depth of water. M. Coquelin gave it life, light, color, movement, variety, interest, even excitement. One held one’s breath, not exactly to hear what *Thouvenin* would say, but to hear how Coquelin would say it. Such a success as that seems to me to be the highest triumph of the actor’s art, because it belongs to the very foundation, and to the most human part of it. On our own stage to *say* things is out of fashion, if for no other reason than that we must first have them to say. To *do* them, with a great reënforcement of chairs and tables, of traps and panoramas and other devices, is the most that our Anglo-Saxon star, of either sex, aspires to. The ear of the public, that exquisite critical sense which is two-thirds of the comedian’s battle-field, has simply ceased to respond from want of use. And where, indeed, is the unfortunate comedian to learn how to speak? Is it the unfortunate public that is to teach him? Gone are the days when the evolution of a story could sit on the lips of an actor. The stage-carpenter and the dress-maker have relieved him long since of that responsibility.

One September night, ten years ago, being in Paris after a considerable absence, an occasional sojourner there went to the Comédie Française to see “*Jean Dacier*,” a tragedy in four acts, in verse, by M. Thomond. When he came out he was too excited to go home, to go

to bed, to do anything but live over the piece and walk off his emotion. He made several times the circuit of the Place de la Concorde, he patrolled the streets of Paris till the night was far gone and his agitation had subsided. It had been produced by Coquelin's representation of the hero, and no tribute to the actor's power could have been more unrestricted and spontaneous. Many years have elapsed since then; the play, for reasons social and political, rather, I think, than artistic, has not been repeated, and the spectator of whom I relate this harmless anecdote has consequently never had a chance of renewing his impression of it. He has often wondered whether his recollection is to be trusted, whether there is not an element of illusion in it, of fortuitous, extraneous glamour. That evening remains with him as almost the most memorable he has ever spent in a play-house. Was there, as it happened, something in his mood that favored the occasion inordinately, or was the whole thing really as fine, and was Coquelin's acting, in particular, as magnificent, as his subsequent ecstatic perambulation would have indicated? Why, on the one hand, should Coquelin's acting not have been magnificent, and why, on the other, if it was as much so as I have ever since ventured to suppose, has it not been more celebrated, more commemorated, more of a household word? I do not remember to have heard that particular triumph very often alluded to. Why, above all, social and political reasons to the contrary notwithstanding, has the play never again been brought forward, if the effect of it was really even but half as great as I imagine it to have been? At any rate, if I may trust my memory, *Jean Dacier* is a part which, now that he is his own master and may take his property where he finds it, M. Coquelin will consult the interest of his highest reputation by taking up again at an early day. As the beauty of this creation comes back to me, I am almost ashamed to have intimated just now that his strong point is the representation of impudence. There is not a touch of that vice in the portrait of the young republican captain who has sprung from the ranks and who finds himself, by one of the strange combinations of circumstances that occur in great revolutions, married from one moment to another to the daughter of his former *seigneur*, the lord of the manor, now ruined and proscribed, under whom he grew up in his Breton village. The young man, of course, of old, before being swept into the ranks, has adored the châtelaine in secret (and in secret only), being divided from her by the impassable gulf which in the novel and the drama, still more than in real life, separates the countess from the

serf. The girl has been reprieved from the scaffold on condition of her marrying a republican soldier,—cases are on record in which this clemency was extended to royalist victims,—and the husband whom chance reserves for her is a person who, in the days of her grandeur and his own obscurity, was as the dust beneath her feet. I say "chance," but, as I remember the situation, it is not altogether that, inasmuch as *Jean* has already recognized her—he naturally escapes recognition himself—as she passes the windows of the guard-house at Nantes in the horrible tumbril of the condemned. A "republican marriage," with the drum-head for the registrar's table, has just been celebrated, before the spectators' eyes and those of the young man; a stout Breton lass (not in this case a royalist martyr) has cheerfully allowed herself to be conjoined by a rite not even civil, but simply military, with one of her country's defenders. This strikes the note of *Jean's* being able (the idea flashes on him as he sees her) to save his former mistress if she will accept a release at such a price. She doesn't know whether she accepts or not—she is dazed, bewildered, overwhelmed. The revulsion is too great and the situation too strange to leave her, for the moment, her reason; and one of the most striking incidents, as well as the most thrilling pieces of acting, that I remember to have seen, was the entrance of Madame Favart, as the heroine, at this stage of the piece. She has at a moment's notice been pulled down from the tumbril, and with her hands just untied, her hair disordered, her senses confounded, and the bloody vision of the guillotine still in her eyes, she is precipitated into the room full of soldiers with the announcement of the inconceivable condition of her pardon in her ears. The night I saw the play, the manner in which Madame Favart, in this part, rendered in face and step all the amazement of the situation, drew forth a long burst of applause even while she still remained dumb.

The ceremony is concluded even before one of the parties to it regains her senses, and it is not till afterwards that she discovers the identity of her partner. I recall, as a scene to which the actress's talent gave almost as much effect as Coquelin's, the third act of "*Jean Dacier*," in which, in the poor room to which he takes her as his bride, an *éclaircissement* comes to pass between these romantically situated young persons. As I allude to it here, a certain analogy with the celebrated cottage-scene in the "*Lady of Lyons*" occurs to me; but I was not struck with that when I saw the play. The step the young man has taken is, of course, simply to save the girl's life; having done this, he wishes

only to efface himself (though he does worship her) without insisting on the rights of a husband. The situation, naturally, is foredoomed to become still more romantic and tragic; by the time *Marie* (I forget her noble surname) discovers that her husband is an uncommonly fine fellow, by the time a new passion on her side begins to take the place of her first impression that he wished to obtain a base advantage of her—by this time it is, of course, too late, and we are close on the edge of the catastrophe. I forget how it comes about; I think (but about all this I am not perfectly clear) through *Jean's* taking or appearing to take part in a secret movement for putting the life of the girl's father in safety as against his own colleagues, the republican chiefs. The attempt comes to light after it has succeeded, and the young man's life, either by his own hand or by military justice, is the forfeit. What I most definitely remember is that as the curtain falls the once proud *Marie*, who has fathomed the depths of his heroism, flings herself upon his inanimate body. All this is very grand (M. Thomond's play must surely be a very interesting one), and my theory would be that M. Coquelin's representation of it was thoroughly superior. Not formed by nature for depicting romantic love, he triumphed over every obstacle which his person might have presented, and gave signal support to the interesting truth that if an actor have the rest of the business in him, his physical appearance, as regards the particular image to be projected upon the sense of the public, is the last thing that matters. The impression of the ear can always charm away anything that needs to be got rid of in the eye. Youth, passion, patriotism, tenderness, renunciation, everything that thrills and melts, everything gallant and touching, appear to me, at this distance of time, to have been embodied in the little republican officer with the weather-worn uniform, the *retroussé* nose, and the far-ringing voice (in two or three of the patriotic couplets of the first act it sounded like a clarion). And it is to be noted that the part is purely and exclusively tragic; the actor is not allowed to help himself by touching any of the other chords of his lyre.

It comes over me, moreover, that if that admirable old Alsatian country schoolmaster in "L'Ami Fritz," of whom M. Coquelin makes so inimitable a figure, is not tragic, neither is he in the smallest degree impudent. This character is an elaborate picture of quaint, old-fashioned geniality and morality and patriarchal *bonhomie*. It is a marvel of specification without exaggeration, an individual reproduced in his minutest peculiarities, and yet kept perpetually in relation to the medium

in which he moves, perfect in tone, perfect above all in taste. The taste in which MM. Erckmann-Chatrian's village schoolmaster is embalmed I judge it would be impossible for M. Coquelin, under any circumstances whatever, to depart from. One feels it is there as a sort of classic temperance—in all the grotesque unctuousness of *M. Loyal*, in the extravagance of the grimacing, chanting, capering footman of "Les Précieuses." In other words, as I have already hinted, in everything he does, in his lowest comedy as well as in his highest, M. Coquelin has style. Of how much he has it in his highest, his *Duc de Septmonts*, to which I have already alluded, may stand as the fullest proof. I have left myself no space to descant on this admirable picture, which I had in mind in saying just now that *Jean Dacier* is his most perfect piece of acting but one. (I can only answer for those I have seen, of course, and there are many that I have not had the good fortune to see. I am ignorant, for instance, of three or four of his creations of the last few years—of *Le Député de Bombignac*, of *Un Parisien*, and of *Chamillac*, which I have heard spoken of in superlative terms, and in which M. Coquelin appears to have won a brilliant triumph.) Confining myself to those episodes of his career which have come under my direct observation, I should say that if *Jean Dacier* is his highest flight in the line of rhymed parts, the *Duc de Septmonts* is his most striking attempt in the field of a closer realism. It is impossible not to have a high opinion of the art which can project so vivid and consistent an image and yet keep it (to borrow again a convenient term from the painters) so quiet, so much in the tone of familiar, conceivable life. There is something in the way M. Coquelin goes through this long and elaborate part, all of fine shades and minute effects, all appearing to the finest observation as well as displaying it, which reminds one of the manner in which the writer of a "psychological" novel (when he knows how to write as well as M. Coquelin knows how to act) builds up a character, in his supposedly uncanny process—with touch added to touch, line to line, and a vision of his personage breathing before him. M. Coquelin is really the Balzac of actors. The effect that his farewell to the Théâtre Français (taken in conjunction with some other recent vicissitudes—now a goodly number, with some other "rifts within the lute") will have upon the classic house itself belongs to a range of considerations which, though seductive, are not open to us here. But it is impossible not to watch with lively interest, and almost with a sort of suspense, the future of the distinguished seceder; his

BENOÎT-CONSTANT COQUELIN, BORN JANUARY 25TH, 1841.

endowment, his capacity, his fortune up to this time, his general intention and ambition, are all of so high and bold an order. He is an image of success as well as of resolution, and we shall watch with curiosity for the forms that success will take with him hereafter. It came to him the first hour he trod the stage, and to the best of my knowledge he has never known a defeat. Not only this, but in a company of which half the members and pensioners spend more of their career behind the scenes than before them, he has never known an intermission of activity. My impression would be that

in the last five and twenty years he has created more parts than almost all his comrades put together. All this is an earnest of very interesting things yet to come; for, as life is measured in the theater, M. Coquelin is still a young man. The defect of his talent is (I have already ventured to use the word) a certain hardness, an almost inhuman perfection of surface; but the compensation of that, on the other hand, is that it suggests durability, resistance. The observation, the assimilation of ideas, can only extend themselves. May they do so as much as possible in the United States!

FENCING AND THE NEW YORK FENCERS.

SALUT !

THE game of attack and defense as it is still practiced with the sword and foil opens up unexpected vistas in history, and of paradoxes it offers not a few. For instance, it is odd that fencing should spring from violent manslaughter and yet commend itself to physicians as a safe and agreeable pastime. In popular thought it is held to be the school of the duel.

Yet the notorious duelists have so seldom been very eminent on the floor that two classes may be said to have existed, duelists and expert fencers. What is said of boxing, that the ordinary boxer learns to avoid the brutality of fisticuffs rather than seek opportunities to use his science *in corpore vili*, is not less true of play with the foil. A knowledge of that harmless little whip of steel does not urge a man to glut an acquired thirst for blood in the arena of honor ; on the contrary, it teaches him self-control while sweetening his temper through the most even, genial exercise that human beings have invented up to the present time.

Not so mysterious in its origin as the dance, the love of warlike games arose, like the dance, from natural causes, so that in early ages the two are found in combination in the sword-dance. As civilization went forward they parted company, only occasionally to meet again. The dance grew from the frantic war-steps of the Berserker, maddened by a mystic drink brewed for the purpose, and from the unseemly dance in which both sexes shared, into the orderly movements of the modern ball, where the barbaric, the blood-thirsty, and the sensual elements have been refined away until nothing is left but the charm of movement unassociated with any selfish aim. So the play of swords runs through the grossness of the middle ages, when knights were cased in boiler-iron, and he was the best who would have made the strongest blacksmith, to the later ages with their refinements of weapons, guards, and assaults. Sword-play had its bloom immediately after the introduction of gun-powder, which with one sulphurous breath blew away the system of heavy armor and forced men to rely on their nimble legs and

nimbler wits, instead of the thickness and quality of their harness. Armor could no longer save, when a shot from cannon or musket drove a hundred iron splinters from a cuirass into the wearer and the comrades by his side. Yet fire-arms of precision had not been invented ; here was an opportunity for the development of the agile art of the sword, which in later periods and in affairs of honor has been gravely compromised by the handiness and perfection of the pistol.

The charm of fencing for beginners is that when you take position before a good swordsman you need not be hopeless of making a point. After a reasonable amount of practice with the foils you are able occasionally to slip through his guard and enjoy the simple vanity of touching the supposed untouchable. This comes from the perfection of fair play reached after several centuries of minute changes in the positions, weapons, and accouterments of the masters of fence. No other athletic sport equalizes so closely the powers natural to a man and a woman, a graybeard and a boy, a Hercules and a consumptive. None is so well adapted to indoor and outdoor work, to winter and summer, to daylight and lamplight ; nor is it, considering the large body of literature connected therewith, and its prominence in cyclopedia and manual of

THE FETICH OF THE FENCERS CLUB.

THE DEN AND ITS PETS.

sports, needful to recall here the wonders it has wrought as a bringer and keeper of health, erect carriage, grace of gait and correctness of bearing, of good spirits and of courtesy. These are commonplaces which can be found in a hundred books; bearing them in mind, we smile to read the tirade from one of Shakspeare's fellow-citizens in the comedy "Two Angry Women of Abingdon" (A. D. 1599): "Sword and buckler fights begin to grow out of use. I am sorry for it; I shall never see good manhood again. If it be once gone, this *poking fight of rapier and dagger* will come up; then a tall man and a good sword and bucklerman will be spitted like a cat or rabbit." We catch in this passage English manners living as they rose, from Italian, French, and Spanish examples; for the noisy sword and buckler men, literal swashbucklers, were survivals of the armored period, when fair play hardly existed, and duels lacked those rigid rules that deprived them of vulgar blood-thirstiness. Saviola, an Italian writing in England, maintained (1594) that the new style of using the point is more rare and excellent than any other. "Considering that a man having the perfect knowledge or practice of this art, although of small stature and weaker strength, may, with a little removing of his foot, a sodaine turning of his hand, a slight declining of his body, subdue and overcome the fierce braving pride of tall and strong bodyes." Saviola was on the winning side. Protests

against "that wicked, pernicious fashion to fight in the fields in duels with a rapier called a tucke only for the thrust" were unavailing, owing to the fact that the new way was infinitely more civilized and equitable. The fence, as it was then called, was in truth a great humanizing element introduced into the brawling sword-play of the fourteenth and fifteenth centuries, though it had not then by any means reached its present perfection. The irritation perceived in the author of "Two Angry Women of Abingdon" is noticeable to-day where men discuss the various schools of fence. The scorn of him who fences wide for him who talks about *le jeu serré*, is returned in kind by the latter, who demands that men toe the mark, keep the blades whirring closely about each other, and never budge the foot save in a classical lunge.

As was but natural, fencing came to America with the Spaniards and Frenchmen who generally antedate the Dutch and English. The period was that of great, but not the greatest, eminence in sword-play. In 1754 John Rievers, apparently a Hollander, taught fencing and dancing to the colonists in New York, on the corner of Whitehall and Stone streets, doubtless encouraged more or less by the British officers in garrison here. The period was still favorable to side-arms, and most gentlemen were supposed to know how

THE BIRTHPLACE OF THE FENCERS CLUB.

SINGLE-STICKS.

to handle a small-sword. W. C. Hulett, his successor, appears in 1770 to have needed a yet wider range of accomplishments to earn a livelihood, for in addition to the small-sword he taught dancing, the violin, and the flute.

In 1789 somebody too delicate to give his name, probably an *émigré* of good family, opened a fencing school at No. 4 Great Dock street (now Pearl). By the end of the year he seems to have decided to cry mackerel in a louder voice, if he be that same M. Villette who uses the columns of the "Daily Advertiser" in September of 1789.

FENCING ACADEMY.

M. Villette respectfully informs the gentlemen amateurs of Fencing, that he intends opening his Academy on the 5th of October in Cortlandt street, the second door from Greenwich street, where that noble art will be taught every Tuesday, Thursday, and Saturday.

A critic of public morals, writing to the press, about 1818, alludes to dueling at that date as well as during the Revolution in these terms: "The favorable reports of duels presented in the hardihood of self-complacency by the parties themselves is another of our growing evils produced by the action of the press, and by the too frequently tolerated ac-

BROADSWORDS.

tion of the army and navy, leading by their influence to the imitation of our citizens. It was not always so; scarcely any duels occurred in our Revolutionary war, and yet who has ever doubted the equal courage and self-respect of the officers of that period?" Yet New York has been witness to several remarkable duels with swords, the most noted being one between two English officers in 1777, the day after their arrival. The *Zebra* was commanded by the Honorable J. Tollemache, brother to the Earl of Dysart, and on board as passenger was Captain Pennington of the Guards. To settle a difficulty between these gentlemen a duel was fought the day after the taking of the town, in a room at Hall's tavern, where the Boreel building now stands. After emptying their pistols at each other, they drew their swords and Captain Pennington pinked the Honorable Tollemache through the heart, but not before receiving seven wounds. This was one of the bad omens at the British occupation of Manhattan.

The present day shows a revival of the fencer's art divested of its questionable fea-

SABER AND BAYONET.

tures and suited to the gentle sex as well as to the harsh, by its qualities as an exercise. In Paris a fencing floor is a common appendage to a *cercle*, or club, because fencing is almost the only sport which can be called national to France. Fencing is pushed by a society for the encouragement of the art which owns no house, and consists in part of persons who never touch the foils, and in part of fencers. The society arranges public exhibitions, sells tickets, and distributes awards, generally in money, to the combatants. Each club has, of course, its private exhibitions depending on the greater or less enthusiasm of its members. *Maitres d'armes*, the heads of fencing floors, and *prévôts*, their lieutenants, are the men on whom the chief society and the club rely for most of the fencing in public; the training school at Vincennes, with its corps of instructors, forms the college of fencing whose graduates fill the position of teachers with the

PARRIED.

regiments, and supply the demand for *maîtres d'armes* in Paris and elsewhere.

Ladies in the best ranks of life fence more and more as they discover its value for health and good looks, instead of leaving it entirely to actresses, who have always used the exercise for learning how to plant and move their feet intelligently. All over Europe the universities foster sword or foil play of one kind or another, and in that nation apart which we call the city of London, a club for fencing has existed these twenty years. The London Fencing Club, under the patronage of the Prince of Wales, and having on its list many peers of the realm, is as aristocratic in its aim as the Fencers Club of New York, of which we will have something to say presently, is democratic. It was founded in 1863 as a club for fencing and gymnastics with a membership of three hundred, and helped to its present quarters by a paternal government. It has two French and three English teachers, and from its nearness to St. James's is of practical use to the officers of the Queen's household troops. It is said that the members are averse to allowing men in trade to enter its patrician doors. The club-house is a very good and convenient one, with dressing-rooms in the upper part of the hall reached by steps, and the management is given to an honorable secretary, who is, and has been since the start, Captain George Chapman. To him is chiefly due the success of this excellent limited club. On this side of the Atlantic a few large cities have always had professors of the art, but, like unhappy Hulett of New York in 1770, seldom has one been able to make a living from lessons in fencing alone. At New Orleans the chances have been better, owing to the large Creole and French population; there oftener than elsewhere have duels in this century been decided by the sword. The Rossières, father and son, were teachers famous in their day. The Orleans Fencing Club is the first devoted solely to the sword which appears in North America; it still exists. In the French quarter *assauts d'armes* are a recognized form of en-

tertainment. One must not forget, moreover, that the German Turn Verein of New York makes something of fencing, and that at West Point and Annapolis it is a branch of study employing a number of instructors, a study which, unfortunately, officers of the army and the navy promptly forget. In Toronto, also, and other Canadian cities fencing clubs including general gymnastic exercises have been established of late.

When the Fencers Club of New York came into being, less than half a dozen years ago, it found itself in an odd-enough cradle, the den of Captain Hippolyte Nicolas on Sixth Avenue. From that dim past let those recall discussions concerning classical and non-classical fencing who were privileged to sit at the little suppers which appeared like magic from upstairs just when midnight and the last *assaut* met. Whether the saber had any chance against the bayonet crossed arguments with the question whether the salad mixed by the captain was more like the music of Gluck or Gounod. Whilst one fencer, worsted in the assault, loudly maintained that the system of this floor lacked style, another gazed rapturously at the brown breasts of partridges peeping coyly from a white wrapping of bacon. Here was a brag of doughty deeds in Paris, there the specimen tale, fresh from New Mexico, unrolled its familiar properties of stiletos, Greasers, and unmanageable bronchos. From this baker's dozen of tall-talkers rose the Fencers Club, now ten times their number, and certainly better swordsmen and more modest than of yore. Not all accepted the system of the captain, but none denied that for interesting a *nouveau* in the art and teaching him quickly how to hold his

AN ATTITUDE OF OBSERVATION.

own against more experienced blades, no man was his equal. M. Nicolas is indeed a rare character, and only truth is told when one says, that had there been no Nicolas, there had been no Fencers Club.

Captain Hippolyte Nicolas, a veteran of the Crimea and the wars of 1859 and 1870, is a man who in the desert of New York cried the evangel of fencing. Not that MM. Monstéry and Sénac, to mention only the last of the various New York *maîtres d'armes*, had

not done their best; but none possessed the self-abnegation of the fanatic, the smoldering enthusiasm of the reformer, the patience of the general bound to win. Yet it was a pure bit of chance that brought him in 1876 opposite the sign of Régis Sénac, *maître d'armes*. The sight of his favorite weapon decided him; he taught under M. Sénac for some months, and then set up a little floor of his own. His

below the belt, on the mask or on the arm; but he reasons that fencing is a preparation to defend the whole figure, whether you have in hand a stick or an umbrella, a small sword or a saber, or indeed can rely on the naked fist only; for he extends many of his pet principles to boxing. A hit is therefore a hit; but those held inadmissible by the classicals are poor hits—that is all. As to the guard again,

NEW YORK FENCERS CLUB—THE FLOOR.

perseverance, and especially his high ideals, did more than anything else to establish the club as one devoted to fencing alone, not associated with gymnastics like the London club. After it was a success, a rifle gallery was added, and bouts with single-stick, broadsword, and bayonet were admitted to the floor. To a progressive mind like Captain Nicolas diplomas signed by *prévôts*, fanciful salutes, competitions with black plastrons and chalked foils, as well as all the old lumber of terms, *quinte*, *sixte*, *octave*, and so on, are but the bedizenments which obscure his goddess. His art is too serious for such externals. Labels, pretty bottles, gold seals, and cobwebs only serve to prejudice him against the wine. The true elixir is the art of offense and defense ruthlessly stripped of pretty and petty play. That is why the classical workman regards Nicolas with a contempt bestowed by a follower of Ingres upon a painter reared in the faith of Delacroix. Nicolas does not go so far as to count of equal value hits full on the heart and hits

Nicolas appears to have applied to fencing a thing rarer in the world than is supposed—thought. A favorite guard is one which is oftener seen in teachers than taught—that with knuckles up and the blades meeting from the left, while the arm is well raised, well forward, and gently bent at the elbow, and the point is on a line with the opponent's body, but oftener raised than opposite his face. This position of observation defends the whole body by two movements, one on raising the point, the other on depressing it, while the hand remains at the same height. The same plan is followed when the blades meet from the right and the knuckles are downwards, and in the lower parries the same general principle is carried out. The merit of the system is its simplicity; but in that Nicolas only follows out the tendency of fencing during its entire history.

Nicolas puts little stress on long lunges, drill of the legs, and those preparatory exercises before the bout begins, called *le mur*,

which are said to derive their name from *tirer au mur*, practice of pupils against a wall, and the object of which is to produce grace of movement and afford time for a fencer in public to assume confidence before the actual engagement. Partly from his nature, which is intensely direct and practical, detesting the superfluous, partly from a calculation of his material, he seeks first to form a fencer who touches the mark, then the elegant swordsman. "What do we need here most?" he asks himself. "A body of fairly good fencers, among whom there shall be the fewest possible 'cracks.' By my simplified method I can soon give the essentials; let those who show interest then proceed to polish and complete. Some, it is true, never will; but is it not preferable that first of all they should learn to defend themselves, however crudely? Under the classical system, time, power, and enthusiasm are wasted on externals, and only rarely can pupils formed in that way break through a superficial elegance to real working ability." There is the reasoning: let every one who loves the sword judge whether or not it is sound. Perhaps the truth is that different natures demand different methods, that where three men work best from generals to particulars, one is more adapted to take particulars first. But let us note here the parallel of reasoning on this art and others—the painter's, for example. In the fine arts we have the advocate of early drill, harmoniousness, finish, who asks that externals be applied first, leaving the larger matters for the last. The lover of finish detests and reviles the teacher who wants to lay a groundwork on big lines and let polish come if it will. Just as in painting there are many schools and much wrangling between them, so in fencing. As a matter of fact there is a method for each master who has any individuality to speak of. Nay, those who think they follow certain great names do not imitate their idols when engaged with equals on the floor, but fight after the manner most adapted to their stature and prescribed by their character.

Under the ardent mastery of Captain Nicolas, emulation of the usual sort is discouraged at the Fencers Club, such as recording the hits, giving prizes, or indeed being eager at all hazards to make points. The wisdom of this will be felt by those who know athletic clubs. Too great eminence on the part of a few causes the rest of the members, who have less time or less aptitude, to stand by and look on. The tendency is toward idle-

ness and betting on a few cocks of the walk; next, the club dwindles; then it becomes extinct. The Fencers Club means to exist for gentlemen who have nothing to do with gate-money, serious matches, betting on players—nothing to do, in fine, with that professional element which has wrecked so many promising organizations. It is American, for it tries for a high average, not for experts with whom an ordinary fencer has but little enjoyment.

Of a Monday night, in the winter months, and well into summer, the passers in West Twenty-fourth street see lighted windows and hear the clash of steel. That is all to tell them that No. 19 is not an ordinary dwelling. It is indeed also the home of the Authors Club, whose rooms above, made charming by the skill in decoration of Mr. Francis Lathrop, are on Thursday evenings filled to overflow by men of letters and their guests. The wood-cuts show the fencing-floor, dressing-room, and hall of the Fencers, and indicate, as well as need be, various fleeting scenes of exercise with the foil, dueling-sword, saber, and bayonet. After the bouts, in which combats with the left hand are always prominent, since Captain Nicolas gives special care to that, a supper marked by the gastronomic talents of the captain unites the combatants and the guests of the evening. Under such wise care nothing has yet occurred to mar that good fellowship which rarely is kept unbroken in athletic clubs. The government is in the hands of nine men, as that of New Amsterdam of yore, and they, as well as the rest of the club, are quite ready to swear by the patron saint of Manhattan Island, Saint Nicholas—particularly after supper.*

The word athletics inevitably brings to mind the Greeks. Fencing is no Greek sport; still it would be rash, as nearly always it is, to conclude that the old Greeks have no lesson for us, no exercises which contained, under different guises, many of the advantages of the foil. The spear and javelin were then the important weapons for attack; the shield and coat-of-mail were their chief defense. Under such circumstances they could not evolve that sword-play which is cuirass, buckler, and weapon all in one. Yet if we regard the Greek mountaineers as the same in race as the Hellenes of the great epoch, these retain traces of an alertness in the use of the short sword and dagger which may show that the classical Greeks were of all men the best fitted for swordsmen had there been occasion. Among them to-day is the expert who will allow any

Mitchell, Karrick Riggs, and S. Montgomery Roosevelt. The shooting-gallery is managed by Messrs. C. C. Buel, B. F. O'Connor, and Raymond Ward.—H. E.

NEW YORK FENCERS CLUB—THE DRESSING-ROOM.

one to rush at him when entirely unprotected, and do his utmost to plunge a dagger in his breast. At the right moment, by a touch on some muscle, the hand clasping the dagger is turned aside and the attacker runs more than a risk of stabbing himself. This is akin to sleight-of-hand, and is a secret jealously guarded by its owner, since it serves a momentous purpose in brawls where fire-arms are not used.

But the old Greeks were masters in games of agility, in boxing, discus-throwing, and other exercises that were very far on the road to perfection. Doubtless the Yankee Sullivan of our age knows how to amass a larger part of his weight and hitting force on his knuckles than the winners at cestus-play in the Olympian games. But how did boxing reach the present stage? As likely as not through the study of refinements of the fencer's art by experts in boxing who had a tithe of Sullivan's bodily vigor but far more brains. As the Greek sculptor shows you the discobolus concentrating all the energy of head, torso, legs, and arms into the hand that lightly holds the discus, so you may imagine the concentration of energy shown by the discobolus, added to the momentum of the step of one foot forward, into a sharp point about one yard in front of the hand. Between these two extremes of past and present, the Greek and the modern fencer, are various picturesque figures in their several epochs. Look at the Teutonic pagan who wields a battle-axe. Here is the mailed knight who came close to his foe and beat him clumsily on the head. Behold the bravo of the four-

teenth century or the Highland chief of the sixteenth, with a small buckler on his left arm, who stood farther off and alternately cut and thrust. Yonder is the Italian *mæstro* of the sixteenth century who often discarded the hand buckler and in the left held a dagger to ward blows, and also, if the fight came to quarters, to stab his enemy. The treatise published in 1536 by Marozzo, *gladiatore Bolognese*, has one cut showing how to use the sword without either dagger or buckler. The position is curious. The left shoulder is not effaced; the body and head lean forward; the guard is very low, yet not lower than that of many fencers in Paris to-day. Finally, the French *maitre* of more recent date, like La Boissière, advised one

to keep entirely aloof, and if he belonged to the superb school of classical fencing that is on the wane, advanced and retreated no more than a step, would not count a touch unless on a line with the heart, and frowned on any thrusts or movements which depart by a hair from the elegance of a Mérignac or the precepts laid down in the books.

This backward march forward of the fencer's art has not pursued a consistent advance. For instance, when the idea of keeping aloof was fully appreciated, some went too far, speaking literally as well as metaphorically, and increased the blade to an inordinate length. An argument in favor of the old short Roman sword was often made after this wise: it compelled an attack at close quarters and so encouraged bravery; for only a brave man would venture close to his foe. Conversely, the very long Italian rapier was thought cowardly by British swordsmen of the fifteenth and sixteenth centuries, as it was supposed to give an unfair advantage. This idea caused Queen Bess to station "grave men" at the gates of towns to break the points from the long rapiers and at the same time cut the long Spanish ruffs about the necks of the gallants passing in and out. Till the present day, fencers in southern Italy use a forty-inch blade with rings through which to put the fingers, and bind the handle to the hand with a long tape or kerchief. But elsewhere men have settled down to the French blade of thirty-four inches which combines all the requirements. It has no devices for making the grip sure, no loop to save the sword if disarming is prac-

ticed. Not so long that it cannot, when in the form of a small sword, be whisked in an instant from the sheath, it does not weary the hand and arm by heaviness. Not so short as to require close quarters, it has no cutting edge and is meant for the thrust only. The foil is, in fact, a cheap and light practicing weapon for the small sword, which remains over from the last century as a part of the court dress of a diplomate and an ornament rather than a weapon for officers of the army and navy. With the inconsistency that marked the French Revolution, burgesses took to wearing swords, and we know of the landscape painter Georges Michel that he used not only to wear a sword, but to use it during the brawls in taverns into which he was led by a brilliant but now forgotten fellow-artist.

A paradox of fencing is the strong aristocratic idea connected with it, and its somewhat plebeian origin. When gunpowder was invented, the ordinary citizen could not afford the expense of armor; only the rich could be knights. When armor was discarded, sword-play existed after a fashion among the poorer ranks who wore no armor to speak of, and from them, that is to say, from plebeians, not from aristocrats, the science of fencing sprang. The first books are German, Flemish, and Italian; the first professors also.

There is trace of this in the preparations for a judicial duel at Smithfield between the Earl of Orlmonde and Thomas Fitzgerald, prior of Kimainham, about A. D. 1414. These Irish Norman nobles were to test their loyalty to Henry VI. by the ordeal of arms. Henry ordered that the latter should be instructed without charge to his pocket "in certain points of arms" by a professional swordsman. We have this swordsman's name, Philip Trehere, and we also know that he was a fishmonger. Our feeling that it is an aristocratic accomplishment dates principally from the

French Revolution, when the nobles, or sword-bearers, were at first brought into fatal collision with the lowest classes, the city rabble and the peasantry, classes to whom a cudgel or a pike were the natural weapons of offense.

In democratic America the success of fencing as a game for health, the perfect development of every muscle, and for grace and bearing in movement, rests on the inherent virtues of the exercise, since first of all it has to overcome the vague identification of fencing with aristocracy. It ought to be, however, and perhaps it is the boast of the United States that a good thing is not rejected because at one time it served a bad master. In New York at least fencing has adapted itself to the needs of the case. Especially has the Fencers Club with its low fees yet careful selection of members done much to accustom people to look on the foil as a substitute for the bat and ball, the tennis racket, and the boxing gloves, divesting it of many false prejudices and raising it to the proper place, at the head of all athletics for gentlemen. Those who are cribbed, cabined, and confined by office work and the wearing life of towns find that fencing is as near as possible to perfection as an exercise. In a land whose glory it is that the name of gentleman does not depend from the occupation to which he may turn his hand and can neither be bought nor inherited — in a land where every man who has it in his heart to want to be a gentleman can be one, this game of address may be expected to flourish. Encouraging, as it does, self-control, forbearance, fair-play, and most of the minor virtues of good breeding; admirable as a training school for the quick eye, the ready wit, and the light, strong hand; the most subtle and thorough preparation for all other offensive-defensive sports like boxing, single-stick, saber and bayonet-play — it is only just that fencing should be called the fine art of athletics.

Henry Eckford.

PORTRAIT (BY HIMSELF) OF A GENTLEMAN WHO DECLINED MEMBERSHIP.

OUR NATIONAL DOMAIN.

GRAPHICAL PRESENTATION OF THE COMPARATIVE AREAS OF THE STATES AND TERRITORIES OF THE UNITED STATES AND THE COUNTRIES OF EUROPE, OMITTING RUSSIA AND ALASKA.

The visionary possibilities of the future product of the United States may be imagined by reference to the following statements:
The land in actual use for growing maize or Indian corn, wheat, hay, oats, and cotton in the whole country now consists of 272,500 square miles, or a fraction less than the area of the single State of Texas.

The entire wheat crop of the United States could be grown on wheat land of the best quality selected from that part of the area of the State of Texas by which that single State exceeds the present area of the German Empire.

The cotton factories of the world now require about 12,000,000 bales of cotton of American weight. Good land in Texas produces one bale to an acre. The world's supply of cotton could therefore be grown on less than 19,000 square miles, or upon an area equal to only seven per cent. of the area of Texas.

THE RELATIVE STRENGTH AND WEAKNESS OF NATIONS.

TWO STUDIES IN THE APPLICATION OF STATISTICS TO SOCIAL SCIENCE.

I. STRENGTH.

FROM one of the little-known but very remarkable financial essays of Pelatiah Webster, a patriot merchant of the era of the Revolution, who most urgently resisted the issue of the Continental currency, predicting all the malignant effects which ensued therefrom, we quote these words :

“ I conceive very clearly, that the riches of a nation do not consist in the abundance of money, but in number of people, in supplies and resources, in the necessities and conveniences of life, in good laws, good public officers, in virtuous citizens, in strength and concord, in wisdom, in justice, in wise counsels and manly force.”

As the century is now just ended since the first steps were taken to frame the Constitution under which we live, it may be fitting to account to ourselves for the work which has been done in the land wherein we dwell during this hundred years.

We may, perhaps, test the wisdom of our laws and the equity of our institutions by measuring the development of our resources, the abundance of our supplies, and the strength of our nation. Our national domain is a trust with which we have been endowed. How have we discharged the trust ?

The main source of all material life is land. The sea supplies food in small measure, but upon the land mankind almost wholly depends. May not that system of land-tenure and that form of government, therefore, be

OUR NATIONAL DOMAIN.

WHAT WE HAVE DONE WITH IT, AND WHAT WE MIGHT DO WITH IT.

SECTION 1. ARABLE LAND—1,500,000 SQUARE MILES.

IN ACTUAL USE.

Corn and Pork. 1,900,000,000 bushels. 112,500 sq. miles.	Wheat. 500,000,000 bushels. 60,000 sq. miles.	Hay. 40,000,000 tons. 50,000 sq. miles.	Oats. 550,000,000 bushels. 30,000 sq. miles.	Cotton. 20,000 sq. miles.	Miscellaneous. 30,000 sq. miles.
I.	II.	III.	IV.	V.	VI.

302,500 square miles now produce all our grain, hay, cotton, sugar, rice, and garden vegetables.

SECTION 2. PASTURE-LAND.

WHAT MIGHT SUFFICE.

Beef. 60,000 square miles.	Dairy. 60,000 square miles.	Sheep. 60,000 square miles.
VII.	VIII.	IX.

(A square mile = 640 acres.)

SECTION 3.

MOUNTAIN AND TIMBER.

considered best which has resulted in the largest production and in the most equitable distribution of the products of the soil? May we not claim this position among the nations?

Is not the only equitable distribution of the materials required for food a substantially even one by weight? There may be a great difference in the quality, but the requirement for nutrition is the same among rich and poor alike; each adult person must have substantially the same quantity of the chemical ingredients of food or "nutrients" by the conversion of which the body is sustained, and which are derived from animal and vegetable food.

There can neither be matured strength in the man nor in the nation without an adequate supply of food; on the other hand, the very existence of the almshouse and the pau-

per asylum in civilized countries bears witness to the admitted necessity of a substantially equal distribution of food by quantity or by weight.

Raw land, if such an expression may be used, itself possesses no more value than free air or running water. A price may be paid, or a contest may be waged for a time, in order to secure the opportunity to reap and dispose of the harvests which are due to original fertility; but, with very rare exception, the virgin properties of the soil are soon exhausted, and what is known as "economic rent" almost wholly disappears; then land ceases to be a mine and becomes a laboratory, only yielding product, and therefore only yielding wages and profits, according to the measure of the labor put upon it and of the capital put into it.

At last it may cease to yield either wages or profits in response to labor and capital unless both are combined under the direction of skill and experience.

There is no absolute private ownership of land in this or in any other civilized country, yet limited possession is necessary to its use and to its production. When subject to such limited possession it becomes useful and valuable.

All systems of land-tenure which tend to limit or retard production, so that even a slowly increasing population gains upon the means of subsistence, may be rightly subject to change. Or if, after the product of the land has been made in sufficient measure for the welfare of all who dwell upon it, it is then so wrongly distributed that a considerable part is wasted in the support of standing armies or dynastic privileges, while great numbers of people suffer from absolute want, it will be only a question of time when such forms, systems, or institutions must give place to others, either by peaceful evolution or by violent revolution.

The purpose of these studies is to treat the present relative conditions of the so-called civilized nations of Europe, and to compare them with the conditions of the United States, in respect to the production and distribution of the means of subsistence which are wholly derived from land.

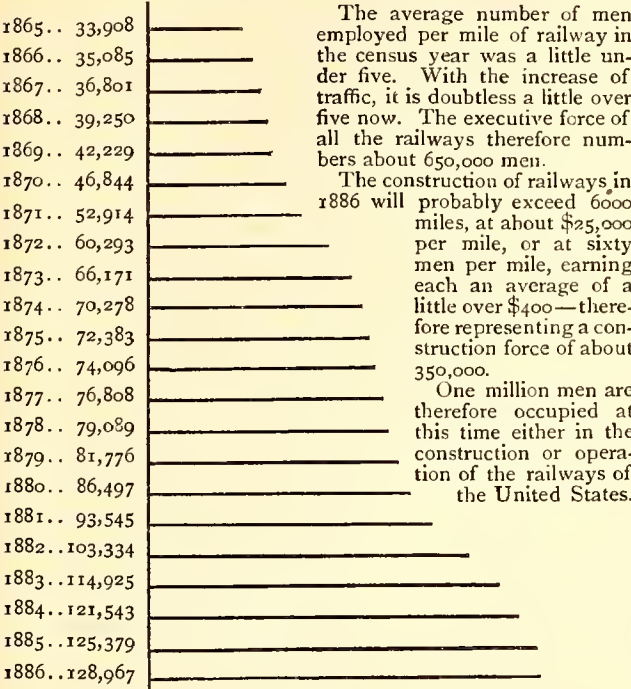

It is proposed to apply the test of such a balancing of accounts as a business man is accustomed to call for when any corporate enterprise is subjected to his scrutiny. The work of States may be considered in the nature of a corporate enterprise subject to the control of the people who are the members of the corporation, as they may choose to direct.

At the same time, all such direction by statutes, and all customs which precede or attain

II.

MILES OF RAILWAY IN OPERATION IN THE UNITED STATES

ON THE FIRST OF JANUARY IN EACH YEAR, BEGINNING 1865.
COMPILED FROM POOR'S RAILWAY MANUAL.

1885.

Capital stock	\$3,817,697,832
Funded debt	3,765,727,066
Other debt	259,108,281

TOTAL.

Passenger receipts	\$200,883,911
Freight receipts	519,690,992
Total, including miscellaneous	765,310,419

The railway mileage, Jan. 1, 1881, was 93,545. In a treatise upon what would be an adequate service, written in that year, the writer said that 117,500 miles should be added in the next fifteen years; but as we should have at least one commercial crisis and railway panic during that period, it might be safer to assign twenty years to the work. Since Jan. 1, 1881, we have had both the crisis and the panic, but we have added 35,422 miles, leaving only 82,025 for the next eleven to fifteen years.

the force of law, must be brought into harmony with a true science of law if they are to be permanent, else they will only create confusion and become inoperative. It may be said that no true science of law has yet been established among men: then the more reason to test the present condition of nations which claim to be governed by law, in order to determine by a comparison of their conditions which one has attained the best results, so that a basis may be laid for a true inductive science of law governing the social order, fully consistent with the higher law which governs the universe.

As regards land, the continent of Europe and the territory of the United States are about even. The area of Europe, including all of Russia, is 3,761,657 square miles. The area of the United States, including Alaska, is 3,501,404.

If we omit in Europe the uninhabitable portions of Norway, Sweden, and Russia, and if we omit Alaska from the territory of this coun-

III.

CHARGE PER TON PER MILE

FOR MOVING MERCHANDISE OVER THE NEW YORK CENTRAL AND HUDSON RIVER RAILROAD, AT THE AVERAGE, IN EACH OF THE SEVERAL YEARS DESIGNATED.

The railway service of the United States for the last four years, 1882 to 1885 inclusive, on the authority of Poor's Railway Manual, has consisted in moving 1,597,058,562 tons of food, fibers, fabrics, timber, metal, and fuel an average distance of 111 miles each ton, at a charge of \$2,052,849,085. The average service for each man, woman, and child of the population has been in moving 7¼ tons of food, fuel, and other necessities of life 111 miles, at a charge of \$9.35 to each person per year, or a fraction over 2½ cents a day.

The New York Central and Hudson River Railroad may be taken as a good example of an important line of railway under most efficient management, and as a standard of what all other lines may accomplish when the magnitude of their traffic will permit them to make as great a reduction in rates. The average charge per ton per mile on this line from 1865 to 1868, four years, was 3.0097 cents per ton per mile. From 1882 to 1885, four years, the charge was 0.7895. Difference, 2.2202 cents. If we may assume that the people of the United States have been saved two and one-fifth cents per ton per mile on the whole railway traffic of the last four years, either by the construction of railways where none before existed or by such a reduction in the charge for their service, the amount or money's worth saved in four years has been \$3,898,373,159, which sum would probably equal the cash cost of all the railways built in the United States since 1865, to which sum might probably be added the entire payment upon the national debt since 1865.

try, we reach a substantially even proportion of habitable land, to wit, about 3,000,000 square miles in each country.

The population of Europe approximates 334,000,000.

When this article is published, the population of the United States will be substantially 60,000,000.

If we omit Russia wholly from the computation, the area of the remainder of Europe covers 1,500,000 square miles, of which the population is about 240,000,000.

1884....	2,982,246,000
1885....	3,014,063,984

The close coincidence between the increase in the miles of railway constructed and the bushels of grain produced will be observed.

It may be held that by the construction of the railways in advance of the population a great rise in the value of fertile land in the East has been retarded and the increased product of the Western farmer has been rendered possible; while under the land-grant system, land which might otherwise have been sold in large parcels has been broken up into small farms by the reservation of alternate sections. Under this influence, a superabundant supply of food has been produced by a less proportion of the population occupied in agriculture in 1885 than in 1865.

The population of the United States is now a fraction under twenty to the square mile; while that of Europe, aside from Russia, is about 160. But there are many portions of the eastern section of the country which are as densely populated as any of the European States, with the single exception of Belgium.

The low cost of the railway service in the United States makes the distance between the farm and the factory of very little consequence so long as there are no artificial obstructions to commerce. The whole country is one great neighborhood in which each man serves the other; and in this is its true strength. The wages for one day's work of an average mechanic in the far East will pay for moving a year's subsistence of bread and meat a thousand miles or more from the distant West.

On the other hand, Europe is filled with obstructions to commerce which are far more difficult to surmount than that of distance.

In other conditions aside from land there is a considerable similarity between this country and Europe. Until a very recent period more than one-half the territory of Europe was still kept back in its progress by the serfdom of the peasantry of Russia; while nearly one-half the territory of the United States which had been occupied before the opening of the

The increase in the per capita product of grain does not show as conspicuously on the chart as the absolute increase, but it gives even greater evidence of progress in common welfare. A less proportion of the population is now occupied in agriculture, and especially in the production of grain, than was required at the beginning of this period, while the substitution of machinery for the arduous hand work of a former day has greatly relieved the severity of the toil, and rendered the harvest much more certain.

civil war was kept back in its material progress by slavery.

Again, there is as great a difference in the relative conditions of soil and climate, and in the physical conformation of the land — as great a difference between the mountains and the plains of the United States, as there is in Europe.

The relative differences in the conditions of the people of the several states of either continent must therefore be sought in some other cause than in the physical geography or the climatology of the two continents.

Reference may perhaps be made to the differences in language and in creed in Europe. But it must be remembered that the settlers who have occupied the United States formerly differed as much as the people of Europe in these matters; yet the common school of this country has proved, or is proving, to be the solvent of race, creed, language, color, and condition, and is rapidly merging the whole population, so far as the conditions of material welfare are concerned, into one single

VI.

HAY CROP OF THE UNITED STATES.

FROM THE STATISTICS OF THE DEPARTMENT OF AGRICULTURE.

Tons.

The hay crop at the farm is worth much more than the cotton crop at the factory.

Food costs the average family three to four times as much as clothing. The combined value of the poultry and eggs only which are annually consumed is computed at \$200,000,000. This is more than the value of the product of pig-iron, silver bullion, and the wool-clip combined.

and substantial body politic, as firmly bound together as if all the people had been strictly homogeneous.

It is not, however, the purpose, nor would it be within the ability of the writer, to attempt any general treatment of the profound differences which have brought the greater part of continental Europe either to actual or prospective national bankruptcy, and in some places to such abject conditions of want as may perhaps account for the conditions of socialism, communism, nihilism, and anarchy. These phases of resistance to social order as now established may perhaps be deemed only the reflex or complement of despotism or of dynastic privileges, and of misapplied and misdirected national greed as yet unenlightened as to what is the true source of the wealth of nations.

The business man who attempts to comprehend the causes and effects of existing conditions may well leave the philosophy of the subject to the student and to the statesman; but perhaps such a one can apply common business methods of account to the conditions of the present, and by sorting assets and liabilities and striking a trial balance of the accounts of the several civilized states of the world, he may perhaps throw a little light upon problems which students and statesmen alike now seem to be incapable of solving.

VII.

PRODUCT OF PIG-IRON IN THE UNITED STATES.

COMPILED FROM THE RECORDS OF THE IRON AND STEEL ASSOCIATION.

Estimate of 1886, given by the courtesy of the Secretary, Mr. James M. Swank.

Tons of 2000 lbs.

The production of iron is a necessity. It is a very arduous and somewhat undesirable occupation; but the number of men and boys required to mine the ore and limestone, to mine the coal used in blast-furnaces, and to convert these materials into pig-iron at the present time does not exceed 125,000, on the basis of the total number thus occupied in the census year.

On the other hand, there is no surer indication of prosperity than an abundant supply and use of iron.

The per capita consumption of iron is greater in the United States than in any other country in the world.

There can be no question that the 3,000,000 square miles of habitable land in Europe, taken as a whole, could sustain in peace and plenty a very much larger population than now exists thereon, if the relations of the people among themselves were the same as the relations of the people of the several States of this Union to each other. The potential of subsistence in Europe has not yet been approached.

Again, if there were no greater obstruction to mutual service between the people of Asia Minor and of North Africa, especially Egypt, than now exists or may soon exist between the United States and the Dominion of Canada, an absolute abundance of food, fibers, fuel, and materials for shelter, upon which material life and welfare depend, would be assured to as large a population in Europe as the absolute but visionary figures of our census bring into prospective view upon this continent a century hence.

If such are the natural conditions, then the social and political differences must be

93,389,031	21 crops made by free labor.
1841-1861, inclusive .. 58,441,906	21 crops made by slave labor.
34,947,125	excess by free labor.

The average weight, per bale, has also steadily increased.

The value of 35,000,000 bales of cotton produced by free labor in excess of the product of slave labor cannot have been less than \$2,000,000,000, or about the full valuation of all the slaves who were made free by the war. This gain is due not only to the freedom given to the blacks, but to the emancipation of the white men of the South from the indignity of enforced idleness.

weighed in the trial balance of nations by their material results. We will set off democracy against dynasties in figures and by the facts of life.

In the attempt to bring into comparison the absolute weakness of the states or nations of Europe whose chief strength is now assumed to be in their armies and navies, I have used tables showing the progress of the industries and arts upon which our own material welfare chiefly rests, dating from 1865 to 1885, inclusive. Several of these tables have been previously used in other publications, but they are now brought down to the latest dates and grouped together in such a way as to show their real significance.

In Europe we find nineteen separate and partly or wholly *independent* nations or states, nearly all governed by dynasties, with the

exception of Switzerland. Even in republican states like France, the dynastic method has not yet been displaced by local self-government in any true sense of that term, while in Great Britain, which in some respects is more democratic than the United States, or is rapidly becoming so, a feudal system of land-tenure remains in force and the paternal form of government yet dominates internal affairs, although it has been almost wholly thrown off in respect to foreign commerce. This centralized system appears to be now culminating in the final struggle of the English Parliament to relieve itself of duties which have become almost impossible, and to relegate to the people not only of Ireland, but of England, Scotland, and Wales as well, the functions of home-rule, of self-government, and the charge of their own local affairs.

Members of Parliament appear to have at length discovered that the lesser details of local affairs are entirely beyond the power even of a representative but single and centralized Parliament, although such Parliament may be nominally supreme. One can more readily comprehend the present condition of Great Britain and Ireland by imagining the deadlock which would arise in this country if it were necessary to apply to Congress for an act to construct water or sewage works for the service of each town or city in Massachusetts or any other State, or to build a railroad in any part of the country.

In the United States, on the other hand, we find thirty-eight *interdependent* States to which others may soon be added, in each of which local self-government in the strictest sense is absolutely assured by the support of the central sustaining power of the nation. We have neither the weakness of the centralized nation nor that of the separate petty states; but under our system we have the united power of a body of English-speaking people outnumbering all the English-speaking people of Great Britain and her colonies combined.

In the town meeting of New England, and of some of the Western States which were settled by her children, and in somewhat less degree in the county divisions of other States, we find an absolute democracy guarding its own local affairs with a jealousy of centralized power which is sometimes even too urgently expressed. Each little community is, perhaps, more self-governing and self-sustaining under the protection, first of the State and next of the nation, than any which ever before existed in any civilized state, or in any period of time since the Norsemen clashed their shields in the meetings of the freemen, from whom so much of our liberty has been derived.

What would have been our condition had

IX.

PROGRESS IN WEALTH.

Computations of wealth, such as are given in the census, are not of much value. Progress in wealth can, perhaps, be measured as accurately by the amount of insurance against loss by fire as by any other standard.

The following table, compiled by Mr. C. C. Hine, editor of the *Insurance Monitor*, of New York, gives the amount of risks taken by all the fire insurance companies which are licensed to transact business in the State of New York.

In the judgment of Mr. Hine, about ninety per cent. of all the insurance taken in the United States is covered by the companies which make an annual report of their whole business in the United States to the Insurance Commissioner of this State.

The effect of the war may be traced by the apparent reduction of risks during the period in which business intercourse with the Southern States was interrupted.

the Potomac become the Rhine, dividing two nominally independent states or communities, or had the country beyond the Mississippi remained under the dominion of a foreign nation?

We may answer this question by referring to the facts. The nineteen *independent* states of Europe, whether empires, kingdoms, dukedoms, or republics, require a standing army of over four million men in the aggregate, to guard the frontiers and to maintain the so-called balance of power. About ten million more men are held in reserve who have already wasted the best and most productive part of their lives in preparing for, or in active war.

The thirty-eight *interdependent* States of this country require a standing army of only 25,000 men, serving mostly as a border police,

and also forming a nucleus around which freemen may gather at a day's warning, to be formed into an army with which it would be useless for any foreign or domestic disturbers of the peace to attempt to cope.

To what do we owe this immunity from force? Is it not mainly because we have *almost* learned the open secret that in all commerce, whether between states or with other nations, each man serves the other, and that the gain of each is the gain of all?

Was there any more potent influence by which the people were induced to surrender their carefully guarded separate existence under the confederate form of government which preceded the adoption of the Constitution, than the difficulties and dangers to the Union which occurred during the Revolution itself, and also in the short period from 1783 to 1787, growing out of the separate attempts to control not only the trade with foreign countries, but of the several States each with the other, by separate laws and regulations?

Were not the prime causes of the war of the Revolution itself and the separation of the colonies of America from Great Britain strictly commercial in their character? The resistance to the stamp tax was but the final pretext. The real grievances had existed for a long period, and they consisted in the attempt of England to prevent the manufacture of iron and steel in the colonies, and to repress textile manufactures, which were rapidly becoming established. To this end repressive laws were passed, commerce between the several colonies was restricted or forbidden, and the navigation acts, passed at the instance of Cromwell in a vain attempt to destroy the free commerce of the Dutch, were revived in an equally futile attempt to restrict the growing commerce of the colonies, especially with the West Indies and the Spanish Main. John Hancock had himself been one of the great smugglers of his day. It remained for the Congress of the United States to do what Great Britain failed to accomplish. By means of the same navigation acts, modeled on those of Cromwell (known as the 12th of Charles II.), applied to our own people, we have substantially succeeded in driving our own flag from the ocean.

Whatever may now be the difference of opinion among men of affairs in this country in regard to the conditions by which foreign commerce shall be conducted, there is but one common judgment as to the vastly greater commerce which exists among ourselves. No one now questions that the stability of this nation and its exemption from the necessity of a large permanent armament have been more fully assured by the single provision of

X.
RECAPITULATION.

The percentages of gain represented by the preceding tables are given below. While all estimates of gain in wealth measured in terms of money are in some respects fallacious, yet perhaps the amount of insurance against loss by fire may serve as an approximate standard. It is computed by Mr. C. C. Hine, of the *Insurance Monitor*, that about ninety per cent. of all the fire insurance companies transacting business in the United States make returns to the Insurance Commissioner of the State of New York. From these returns he has compiled a table, from which the following figures are taken:

AMOUNT OF INSURANCE AGAINST LOSS BY FIRE.

1859.....	\$1,498,569,125
1865.....	2,564,112,505
1885.....	10,517,940,175

RELATIVE GAINS, 1865-1885.

Per cent.

The excess of grain, cotton, etc. which we cannot consume is exchanged for foreign imports, of which seventy-five to eighty per cent. consists of articles of food, or of crude or partly manufactured materials which are necessary in the processes of domestic industry.

our organic law which forbids any interference with commerce between the several States, than by any other law or custom which exists among us. Had it not been for this absolute freedom of domestic trade, we might have repeated the blunders of European states, and we might now be in almost as desperate a condition as many of them are in.

It will be in no boastful spirit that some of the material results of a century of the constitutional history of this country will now be given and the balance struck with other states or nations. It is only since the passive war of slavery culminated in the active war by which it destroyed itself, that a citizen of the United States could face the English-speaking people of other lands without a blush of shame. It is only in the last twenty-one years, or since slavery finally surrendered at Richmond, that local self-government has had any existence over the southern half of our country. *The Southern States have gained in their defeat the very end for which they rebelled; and they have now discovered for themselves that local self-government can only exist in any true sense where the equal rights of all men are respected, and when sustained by the power of a great nation.*

There has been not only such a revolution of institutions, but of ideas in the Southern States, that it would take a larger Northern army to re-impose the burden of slavery upon them than it did to remove it. The growing prosperity born of liberty is now so fully

assured that the very "rebel brigadiers" have become most loyal citizens and safe legislators; yet less than a generation has passed since all this was accomplished. All that we can therefore claim is that we have just begun to comprehend the problem of common welfare, while we admit that we have yet much to learn.

Short as has been the period since we first began to reap the harvest of true liberty, yet cannot the words

DISARM OR STARVE

be read between the lines or underneath the figures of the balance-sheet of nations which is now submitted?

When government by force of arms meets the competition of a free people governed by their own consent, in the great commerce of the world, what chance of success can there be on the part of states into the cost of whose product is charged the blood-tax of huge standing armies and of war-debts, or upon whom a war-tax presses which takes from a product that would barely suffice for a meager subsistence so much that many are already starving or only eking out a feeble life on pauper wages?

I have endeavored to put into the form of what may be called a visible speech the results of the comparisons which I have made in regard to the relative weakness and strength of this and of other nations,* from the standpoint simply of a man of affairs engaged in the daily work of life.

I have taken the year 1865 as the starting-point. It is sometimes held, and perhaps with truth, that in the very struggles which ensued between the dates 1861 and 1865, in the effort to eliminate from our organic law the elements of injustice and wrong by which it had been perverted, that the imagination of the people of both sections was first aroused and their knowledge of each other was greatly extended. A knowledge of the vast extent of the land and its resources also became common to all. Thus great enterprises became possible which might otherwise have been deferred for half a century or more. The great railroad constructor, the manufacturer, and the merchant of to-day engage in affairs as an ordinary matter of business, which to their predecessors, or even to themselves in their early manhood, would have been deemed impossible of accomplishment in a whole lifetime. Before the war, one line of railway to the Pacific was the

* The substance of this article was first submitted in the form of an address to the American Association for the Advancement of Science, at the meeting of 1886, held in Buffalo in August last.

XI.

LIFE INSURANCE.

COMPILED BY MR. C. C. HINE, EDITOR OF THE "INSURANCE MONITOR," OF NEW YORK.

There are now twenty-nine solvent and prosperous life insurance companies in the United States, of which nineteen were in existence in 1865. Between these two dates others have become insolvent.

The data below show the progress of the existing companies by a comparison of their risks in force in each year.

vision of a half-cracked enthusiast; to-day the opening of a fifth or sixth line would call only for a descriptive paragraph in a newspaper.

In the table on page 423 the proportions of arable, pasture, and mountain or timber land of the United States is repeated from the last CENTURY as the preface to the subsequent tables. Much of the pasture land may yet be converted into most productive arable land by irrigation; while the mountain and timber land is permeated by a great number of fertile valleys.

Subsections I. to VI., inclusive, show the absolute use of land for our present grain, vegetable, and cotton crops, upon which we now produce grain enough for 80,000,000, and cotton enough for 250,000,000 people or more.

Subsections VII., VIII., and IX., if they were cultivated by well-known methods of intensive farming, would suffice for a larger product of beef, wool, and mutton, and of milk, butter, and cheese, than is now enjoyed by the present population, even at a more wasteful and lavish mode of subsistence than is now practiced.

In tables subsequent to the first I have

given the statistics of the increase of cotton, of the railway mileage, and of the products which lie at the foundation of all material welfare.

The tables printed in connection with this article give conclusive testimony to the enormous growth in wealth of the United States since the end or even during the civil war. It is admitted, however, that growth in wealth may not be synonymous with growth in general welfare. Absolute proof of the latter, statistical especially, is a matter of great difficulty to the economist and the statistician. For the present I can only refer to the following table No. XIII, in which the increase of deposits in the savings banks of Massachusetts is given, and also the increase in the purchasing power of a dollar, as shown in table XII. This subject will be treated more at length in a future article.

In the judgment of the Commissioner of Savings Banks, and of many others who are competent to form an opinion, at least three-fourths of the present deposits in these banks belong to those who are strictly of the working classes, in the limited sense in which those whose daily work is necessary to their daily bread make use of that term. This system of savings banks, managed by unpaid trustees without expectation of personal profit to any stockholder or individual, or to any one except the depositors and the relatively small executive force required, is practically limited to New England and the Middle States. The total sum on deposit in all those States is now computed at \$1,100,000,000, at an average of \$356 to each depositor.

If the system were extended throughout the country, and the deposit per capita of the people of the United States were equal to that of Massachusetts, the total sum would amount to somewhat over \$8,400,000,000.

Another fact may be cited which fairly sustains the general statement that those who do the actual work of production are now securing to their own use a larger share than ever before of the joint product of labor and capital.

The earning power of \$100 in gold coin invested in United States bonds of the best class was, at the highest point of paper-money inflation in 1864, $16\frac{6}{100}$ per cent. per year. At the present time the earning power of \$100 in gold coin invested in $4\frac{1}{2}$ per cent. United States bonds is only $2\frac{20}{100}$ per cent. per year.

While the power of capital to secure income merely as capital has thus been diminished, the wages of by far the larger part of all the mechanics, operatives, domestic servants, and the like, are now as high or higher in gold coin

XII.

WAGES, PER DAY, OF CARPENTERS, PAINTERS, MACHINISTS, BLACKSMITHS, CABINET-MAKERS, AND OTHERS IN SIMILAR OCCUPATIONS.

Comparisons of wages at different dates and in different places are apt to be fallacious, because of the difference in conditions; therefore, certain specific leading establishments have been taken as a standard, where the work has been continuous. The statistics were obtained by the Massachusetts Bureau of Labor Statistics, in part from the books of the employers and in part from the accounts of workmen.

" 1881.....	102.97	
" 1885.....	123.63	
Average, year 1885.....	126.44	

Wages of mechanics in Massachusetts having been twenty-five per cent. more in 1885 than in 1860, while the purchasing power of money was twenty-six per cent. greater, the workman could either raise his standard of living, or on the same standard could save one-third of his wages.

than they were in paper money at the highest point which wages or earnings reached in the paper-money inflation period of 1864 to 1867. See table XII.

By the use of this extremely valuable table of the prices of 200 commodities, constituting almost everything necessary to subsist-

ence, compiled by Mr. Wm. M. Grosvenor, of New York, it appears that if the purchasing power of one dollar in gold coin, on May 1, 1860, be taken as the standard, or one hundred cents' worth, the corresponding purchasing power of one dollar of lawful money on May 1, 1865, at a period of great paper inflation, was $56\frac{84}{100}$ cents' worth of the same commodities. On May 1, 1872, in the year preceding the financial collapse of 1873, the purchasing power of a paper dollar was less than seventy-five cents' worth.

At the present time, and at present prices, the gold dollar will buy twenty-six per cent. more than in 1860. That is to say, wages are now as high or higher than they were from 1865 to 1872 in paper, and much higher than they were in 1860 in gold: they are now paid in gold coin or its equivalent. This gold coin will buy the commodities which are necessary to subsistence, in the ratio of 126 units now relatively to 75 units in 1872, and to $57\frac{1}{2}$ units in 1865, or to 100 units in 1860. Wages have increased absolutely and relatively, while profits have decreased relatively in much greater proportion.

It is made apparent that the increased abundance derived from our fields, forests, factories, and mines must have been mostly consumed by those who performed the actual work, or who belonged to the working classes in the sense in which those who work for wages choose to construe that term, because they constitute so large a proportion—substantially about ninety per cent.—of the whole number of persons by whom such products are consumed.

The greatest increased production has been in substances which are mainly used by the masses of the people. Articles of food necessary to life have increased more than the luxuries consumed by the rich. Hence no other evidence is needed to prove that the working men and women, in the strictest meaning of those words, are, decade by decade, securing to their own use and enjoyment an increasing share of a steadily increasing product.

The labor question, as it is called, therefore consists in determining the conditions of the distribution of that greater proportion which is consumed by those who do the physical work of production. Invention creates opportunity for skill, and hence skilled workmen who do not bind themselves to work at the same rates of wages as those who are less skillful or less industrious, are steadily rising, so that there may now be greater disparity between the conditions of skilled and common laborers than ever before.

While the great products of the United States

XIII.

DEPOSITS IN THE SAVINGS BANKS OF
MASSACHUSETTS.

Population, 1865.....1,267,329
 Number of deposit accounts..... 291,488
 Average deposit each account..... \$205.62
 Average deposit per head of population..... \$47.29

Population, 1885.....1,941,465
 Number of deposit accounts..... 848,787
 Average deposit each account..... \$323.99
 Average deposit per head of population..... \$141.64

If the savings bank deposit of the whole population of the United States were now equal per capita to that of Massachusetts, the sum of such deposits would be over \$8,400,000,000.

have thus increased, in the same period the burden of the public debt of the nation has been steadily reduced. The books of the Treasury never showed the maximum debt; but in his last report as Secretary of the Treasury, the Honorable Hugh McCulloch added the debt which was due August 1st, 1865, but which had not been audited and entered, to the debt then recorded, showing that the maximum debt was but a fraction under \$3,000,000,000.

Our ability to reëstablish the specie standard of value has rested mainly upon our power to produce a great excess of food, cotton, oil, and other commodities, which we have been able to export in exchange for our foreign purchases, while retaining our production of gold and adding thereto in the full measure necessary for our purpose.

A review of the traffic of the last five years will show the relative importance of our foreign commerce.

In the five fiscal years ending June 30, 1881 to 1885, inclusive, the exports of domestic products, consisting in much the greater pro-

portion of the products of agriculture, have been valued at the port of export at \$3,873,057,515, an average of \$774,611,503 each year.

At the average of \$200 worth of product per capita of the population, or at \$600 worth of product to each person occupied in gainful work, mental, mechanical, manufacturing, or distributive, this export represents the result of the work of 1,291,019 farmers, mechanics, factory operatives, railway employees, merchants, and others, in each year. So large a part of these exports, however, consisted of cotton and other farm products, that the average of \$600 product per man is too high; \$500 per hand would be a large estimate, at which rate our average export for five years would represent the product of 1,549,223 persons, and even that estimate is probably too small. Except for this foreign demand for the excess of our food, of our cotton, of our oil, of our dairy products, and the like, they might have rotted upon the field or remained unused because they were the excess over our own lavish and wasteful consumption.

In exchange for these products of our own fields, mines, and factories, we have imported \$3,314,818,061 worth of the necessities, comforts, and luxuries of life; the balance of the traffic, including the profits of our export trade, having come back to us almost wholly in gold coin or bullion.

Possessing as we do an almost paramount control of the most available supply of food and cotton which Europe must have or starve, we hold a demand check upon every bank in Europe for the coin or bullion on which we maintain the specie standard of value, which is so essential to prosperity.

The commodities imported in the five fiscal years ending June 30, 1881 to 1885, inclusive, have been classified in the National Bureau of Statistics as follows:

A. Articles of food and live animals	\$1,079,869,829.00
B. Articles in a crude condition which enter into the processes of domestic industry.....	720,826,681.00
C. Articles wholly or partially manufactured, for use as materials in manufacturing and mechanic arts.....	390,102,678.00
	2,190,799,188.00
D. Articles manufactured, ready for consumption.....	718,300,081.00
E. Articles of voluntary use, luxuries, etc.	405,718,792.00
	1,124,018,873.00
Total	\$3,314,818,061.00

Free of duty	\$1,024,385,175.00
Subject to duty	2,290,432.886.00
Duties paid thereon	986,002,925.00

Export per capita	\$17.52
Imports " "	15.04

Except for this export our excess of grain and cotton could have little or no present use, and therefore no value; what we import we could not pay for except with grain, cotton, oil, etc. The whole value of our imports, therefore, becomes the secondary product of our own labor, and the sum of such imports is so much added to the fund from which wages, profits, and taxes are alike derived.

In the use of the imports which enter into the processes of our domestic industry and are thereby converted into domestic manufactures, another great body of industrious working men and women have been occupied.

Although the domestic commerce of this and of every other civilized nation is vastly greater in volume and value than its foreign commerce, yet the latter serves as a balance-wheel to the whole. The interdependence of nations thus asserts itself; the wider the commerce or mutual service, the greater the result of the labor applied, the lower the proportionate cost, and the higher the rates both of profits and wages, which are alike derived from the final sale of all products, whether the money distributed comes from the sale of the primary products of strictly domestic industry or from the secondary products imported in exchange for the excess of the first.

Thus far it has been easy to prove the enormous growth of the productive power and of wealth in this country. We have gained in "number of people, in supplies and resources, in the necessities and conveniences of life"; have we made equal progress "in good laws, good public officers, in virtuous citizens, in strength and concord, in wisdom, in justice, in wise counsels, and manly force"? If we have not, then

"Of what avail the plough and sail,
Or land or life, if freedom fail?"

May not this vast gain in the conditions of material welfare in the United States be mainly attributed to the following elements in our national life?

First. The free purchase and sale of land, and the stability which ensues from the fact that so large and constantly increasing proportion of the people actually possess land.

Second. Absolute freedom of exchange among the several States.

Third. The system of common schools which is now extending throughout the land.

Fourth. The protection which the possession of the right to vote gives to the humblest citizen.

Fifth. Local self-government in the strictest sense, in the management of local affairs.

Sixth. General laws in most of the States enabling cities and towns to provide water and sewage without special acts of legislation, and also enabling corporations to be formed for the construction of railways, so that no monopoly of the mechanism of exchange can exist.

Seventh. The habit of combination and organization engendered by long practice, to the end that if any thousand persons, with perhaps the present exception of the lately enfranchised blacks, were suddenly removed to some far distant place, away from their fellow-men, the men of adult age would immediately organize an open meeting, choose a moderator, supervisor, or mayor, elect a board of selectmen, of assessors of taxes, and a school committee, appoint one or two constables, and then, adopting the principle of the English common law, would at once undertake their customary gainful occupations.

These factors in the life of a free people are not named in the order of their relative importance, but are given in a list, each relative to the other, and, as a whole, composing the main elements of our social organism.

There may be a fallacy in the old democratic dogma that "the government is best which governs least," but there is no fallacy when it is put in another form: That country will prosper most which requires least from its government, and in which the people, after having chosen their officers, straightway proceed to govern themselves according to their common habit.

In the conclusion of this branch of the study of the facts and figures of this country, may it not be held that the alternate periods of activity and depression which have affected the industries of this country since the end of the civil war, have been mere fluctuations or ebbs and flows in the great rising tide of progress, ending in an adjustment to ever new and better material conditions of life? Is it not true that while the rich may have become relatively no poorer, the poor have been steadily growing richer, not so much in the accumulation of personal wealth as in the power of commanding the service of capital in ever-increasing measure at a less proportionate charge? Can it be denied that labor as distinguished from capital has been and is securing to its own use an increasing share of an increasing product, or its equivalent in money?

Edward Atkinson.

THE PRICE OF LIBERTY.

THE PUBLIC DEBT OF THE UNITED STATES.

* Debt audited and entered on the 31st of August, 1865, being the highest record. \$2,756,431,571
 Added for debt due but not then audited. 240,954,632
 Total. \$2,997,386,203

† According to the old form, corresponding to the form in use 1865-85 inclusive, which does not include the bonds advanced to the Pacific Railroad Company to be paid by them. The first statement for October 1st, 1886, includes these bonds and excludes the value of subsidiary silver coin from assets.

The cost, measured in money, of removing the compromise with slavery from the Constitution of the United States, was as follows:

The national revenue collected from April 1, 1861, to June 30, 1868—four years of war and three of reconstruction under military rule—was:

From taxation and miscellaneous receipts \$2,213,349,486
 From loans which had not been paid June 30, 1868. 2,485,000,000
 Total \$4,698,349,486

The peace expenditure would not have been over. 698,349,486

Cost of the war. \$4,000,000,000
 To the computed cost of the war—\$4,000,000,000—must be added by estimate the war expenditures of the Northern States and the value of the time, materials, and destruction of property in the Southern States, together probably amounting to a sum equal to that spent by the National Government.

The price of Liberty in money has therefore been \$8,000,000,000.

This comes to \$1,135,000,000 per year for a little over seven years. The productive capacity of an average man is now about \$600 worth per year. If it was then \$500 worth, this sum represents the work of 2,270,000 men for seven years; at \$400 each, 2,837,500 men.

The average population during this period was 35,000,000. If we assume one in five an adult man capable of bearing arms, there were 7,000,000, of whom one-third paid the price of liberty in work for seven years, or in life.

In an address given in Georgia a few years since, the writer ventured to predict that a time would come when the children of Confederate soldiers would erect a monument to John Brown in commemoration of the liberty which he brought to the white men as well as to the black men of the South. Has it not come?

THE WIMPY ADOPTIONS.

By the author of "The Brief Embarrassment of Mr. Iverson Blount," "The Hotel Experience of Mr. Pink Fluker," etc.

"When people begin on the adaptin' of other people's childern, they is never any tellin' where it'll all end."

HIS remark used to be made often by one of the most excellent ladies in our neighborhood. Long before its first utterance and the events which I purpose now to relate, Mr. Lazarus Wimpy, after a courtship languidly extended through many years, married the woman whom gradually he had come to believe about as well fitted to promote his domestic well-being as any that he might reasonably hope to obtain. The fruits of this marriage, coming at equal intervals of two years, three weeks, and six days (an interesting freak of periodicity, Mr. Wimpy always thought), were, first, Faithy, a daughter, then Lawson, a son, lastly, Creecy, a daughter. Their dwelling, six miles west of the village, half a mile north from the public road, having, besides the usual two shed rooms in the rear, a small one at one end of the front piazza, stood upon a knoll, near the center of the plantation of some four hundred acres of good, though rather rolling, land. Near, on one side, were the kitchen, smoke-house, dairy, and two cabins, quite enough for their small squad of negroes. On the other, outside of the yard, were the horse and cattle lots. In the rear was the garden, and in front, at the foot of the knoll, was the spring that ever since the settlement thereby had been the talk of the neighborhood and the pride, though not boastful, of the family. There was hardly a homestead in that region that had not a spring of some sort near by, though the larger planters generally had wells dug in their yards for the sake of more convenience and sometimes greater coolness. But one attempt had ever been made to supplement the water supply on the Wimpy place. Miss Faithy used to tell of that in words that showed becoming compassion for the needy expert who proposed it.

"They come a man 'long here one day, with a bundle o' green switches under his arm, prewidin' that with ary one o' them he could tell where to git water the quickest and moest. I didn't laugh right out in the man's face, because my parrents never raised me to sech

as that; but I told him, polite as I could, to foller me if he choosed a few steps. When he had laid eyes on our spring, an' when he have drunk a gourd I give him with my own hands, the man looked, he did, like he were 'shamed of hisself, an' I were that sorry fer him, I made him set down on the bench under the big sweet-gum, an' I went an' fetched some light-bread an' butter, an' honey, to go 'long of the jug o' milk were already there. He 'peared like he feel some better then; for he were a person of good, healthy appetites, an' the nex' I heerd of him, he were stretchin' his switches on the Alford's preemurses, an' no wonder; because they has nigh on to a hundred in fambly besides of stock, an' their spring have to be cleaned out every 'casional in the bargain. But as fer me, a body ought to try to not to be proud, an' that of the blessen's of Providence—yit I am not a person that I could invie them, no matter how many niggers, that has to drink well-water, for man *an'* beast."

Do I not remember that spring with its bold bubblings from the pebbly bottom, impatient of the great rock curb that delayed them to supply that economical family, before hastening to the creek a mile away, and the white oaks above, and the willows and sweet-gum below, under the last of which Mr. Lawson used to sit and watch the bees coming to drink, and, whenever I and other children would be there reveling in the glorious refectations extended to Miss Faithy, tell us tales of his huntings in the forests all around.

When I first knew the neighborhood the parents had been long dead. The youngest child, lately widowed by the death of her husband, who, during the ten or a dozen years of married life, had spent the little property she had inherited, had come back to her native homestead. Her sister and brother had never married, and now were never so much as dreaming of such a thing. It was a harmonious family; that is, in the main. The younger sister after her return, on occasions at first frequent, and then at intervals of irregular duration, showed signs that she considered that she should be regarded as the head of the family, basing this claim upon the wisdom presumed

"MIS' WIMPY, COME TO AST MIGHT I COTE MISS MILLY, SIR."

to have come from marriage experience, a gift not possessed by the others, and which, at their ages, regarded by herself so very far advanced beyond her own, it was not to be expected that they ever would attain. But Miss Faithy, with more or less decision of mood and manner, ignored this claim and held to the position to which she believed that by her age, if nothing else, she was entitled. She had inherited (from some remote ancestor, as seemed likely) energy to a good, not to say high, degree, and, as a general thing, she was able to express herself even with some animation, when believed proper, on whatsoever subject she felt herself competent to discuss. Contrariwise, her brother was mild and taciturn, though not gloomy, nor, strictly speaking, indolent. If he had been as active a person as his elder sister, it is possible that this estate, yet held jointly, would have been larger. But they both felt that the accretions had been enough for their needs; so the sister never complained, nor felt like complaining at her brother's habitual pitch of the crop and other outdoor work at a figure that would

not hinder his indulgence in the pastimes of which, one especially, he had been fond from his youth. The lead in the household he had willingly yielded, since the death of their parents, to his elder sister. This submission, instead of diminishing her affection and respect for him, enhanced them; for the taciturn, yielding man will more often be appreciated at his just value than the loud and domineering. Habitually Miss Faithy consulted him in matters about which she was doubtful and she sometimes said:

"Lawson may be a say-nothin' kind of person; but you git into de-ficulties in your mind, an' they is monst'ous few men their jedgments I ruther have. When you git down to the bottom o' Lawson, he's deep."

The ladies, especially Miss Faithy, were tall, somewhat gaunt, but not uncomely, full of health, first-rate housekeepers (especially the elder), hospitable, economical, given (notably the younger) to visiting among the neighbors, and always glad, even to acknowledged gratitude, when visited by them. The gentleman was of middle height, inclining of late

years slightly towards stoutness, slow and low of speech, yet, if you gave him time, able to interest more than you would have expected. If he had been pressed to admit what he had most special fondness for, his answer must

her closest neighbor, she would talk about thus:

"People ought to try to be thankful, Betsy, that it were a blessin' the po' creetur leff no offsprings; an' if it *wasn't* a sin, a body might not feel like cryin' *too* much when he went; which Doctor Lewis told me in the strictest confidence, that nigh as he could come to his diseases, he thes give out from bein' of no 'count. *An'*, which in cose it is *not* the jooty of a person to talk too much about them that's dead an' gonied, but what beat me is Creecy a-tryin' to fling up sometimes to me an' Lawson of her onct a-bein' of a married person an' me not, to give her the k'yarrin' of the smoke-house an' pantry keys, like ef the livin' of thirteen year with sech as Reddin Copelin have made a wisdom out of her an' a ejiot of me. Yit we was thankful, me an' Lawson, when she could git back where she could git a plenty to eat; an' ef the child knowed her own mind, she were thankful as we was. But it's cur'ous how the gittin' of married of some women, makes no odds how triflin' the men they took up with, special' when they're widders, how they can consate that they must be the heads of people that's older than them, an' norate an' go on same as ef they be'n to a colleges somewheres, nobody knows wheres. I suppose it's a some consolation that ef they got nothin' else to brag about, they've had expe'unce o' things which is worth more than them that hain't been calc'latin' on. Yit Creecy's a affectionate sister, an' in general she give up when she see that I can't be convinced; she learnt that much from Red Copelin that I can't tend to my own business."

This was the only drop that was not sweet in the cup so abounding with peace and plenty. It was only a drop, and that not a bitter one. I remember that when I used to go there to carry or bring away some work (for Miss Faithy was a noted cutter and maker) I wondered that the whole family, instead of being mainly gaunt, did not all look like rotund stall-feds, and that I constantly, if vaguely, expected somebody from somewhere to come and fatten on this exuberant fecundity. And sure enough they did.

Even if I knew the precise ages of the members of this excellent family, there are reasons why I should not tell; not that the two oldest would have objected to the revelation, but that there are proprieties in cases of unmarried persons who have so remained for other reasons than that of extreme youth, throughout a somewhat extended period, that ought to be and, so far as I am concerned, will be respected. I pass on, therefore, at once to the Pringles.

MR. SOLOMON PRINGLE.

have been bee-hunting. In this sport he was as successful as fond. The number of bee-trees that he had found and reduced not even himself could have told. Whenever in his presence a bee rose from drinking at the Wimpy spring-branch, as soon as with wings outspread he set forth on his line, Mr. Wimpy would know if he were domestic or savage. If the latter, marking with his eye the insect's departure and latitude with a precision that no compass and quadrant could surpass, he would set out at his leisure, and afterwards tree him as infallibly as if he were already working in the Wimpy garden.

A peaceful, harmless life was that led in that household. What interruptions were made by the younger sister's ambitions were never important, and they diminished with the lapse of time. Not often was allusion made by the head of the family to her departed brother-in-law, but sometimes to Mrs. Keenum,

II.

IF anybody ever did know a more shiftless set than the Pringles, he must have been a traveler. They lived, such living as it was, in a log-cabin belonging to the Wimpys, situate near the junction of the public road with that leading from their place. Being nearer to these good people than anybody else, it was some relief to them when Mrs. Pringle died and Mr. Pringle was gotten away. Their children, Jesse, ten, and Milly, six years old, could then be taken care of with less trouble and expense than the whole family had inflicted heretofore. Miss Faithy, never laying claim to be an uncommonly charitable person, had fed and scolded, scolded and fed these imbeciles ever since they had been dropped there whence nobody, I believe, ever knew; and when the children had been left motherless, she said to her brother:

"Lawson, it's thes like they was two suckin' calves, with a dead mammy an' a-be-longin' to nobody; er ef so be, their owner won't acknowledge 'em. But it's not goin' to do for 'em to per'sh thes so; fer the good Lord never wants sech *as* that, when it can be help. Ef the Alfords would take 'em, or ef—but no use of *effin'* about it. They're nigher to us than anybody else, an' we've had 'em to feed tell now, anyhow, an' I don't know as we've missed or be'n much worst off fer doin' of it. Me an' you, it seem to me, will thes have to take 'em, a prewidin' that Sol Pringle will take hisself off, as my opinions is he'll be ready an' willin' enough to do. You can, as it were, ruther *adap'* that Jes, an' me, po' little Milly, or we can *adap'* 'em both j'intly; that is, of cose, tell they old enough an' big enough to help theirselves. It won't do to turn 'em out thes so in the howlin' wilderness. It'll be a trouble; but it seem like a jooty which a body *can't* dodge, an' maybe we won't go 'ithout a award some time *er* another ef we don't try to dodge it."

Her brother, as she knew he would, after solemn deliberation, yielded to the proposal.

Mr. Solomon Pringle, in spite of appearances, had always spoken of himself as a person of lofty aspirations, which, but for the incumbrance of wife and children, he believed could achieve eminent success. He gave a resigned assent to the Wimpy proposal, that included his own perpetual withdrawal from the neighborhood; but he stipulated that he should not be hindered from sending to them such portions of his achievements elsewhere as his parental affection might urge. He shook hands all around, admonished his children to remember his precepts and continue to be good, accepted silently the money given by

Miss Faithy for his household goods, apprizd at double their value, then cheerfully departed westward.

These things occurred shortly after Mrs. Copelin, having nowhere else to go, had returned to the home of her youth. She did not heartily approve the advent of the orphans, and suggested the trouble, expense, and scarcity of room; but her sister answered decisively that they would come. As for the expense, they would be expected, when old enough, to work like the rest of the family; as for room, the boy could have a trundle-bed in Lawson's shed, and the girl sleep with herself; and as for the trouble, whoever counted upon living without some trouble in this world must have read the Bible to not very much purpose; and that as for herself, she believed that less trouble would be in taking than in turning backs against them that it did seem the good Lord had placed in the very path

THE RETURN OF THE BEE-HUNTERS.

a body was treading. So they came, and if they did not improve, my, my!

"It natily did do a body good, Betsy," said Miss Faithy to Mrs. Keenum, some time afterward, "to see how the po' little things

did eat an' th'ive on it. People can see for theirselves the creases they come with in their jaws has gone cleaned away, an' their stomachs well as their jaws shows what a plenty of clean victuals, an' washin' reg'lar do for them that was a per'sh'n' an' thes *a-rollin'* in the dirt. An', bless you, 'oman, I wer'n't *a-countin'* on the comp'ny they is; which Lawson is *not* a talkin' person, an' Creecy let on mostly what *she* learnt bein' a married person, that ain't interestin' to me as them children, that they'll talk everlastin', an' special' that Jes, which *he'll* rattle on tell the cows come home, ef you want him. But they're biddable little creeters, an' 'pear like goin' to be industrious. Thes betwix' us, I were little afeard at the first off-start that that Jes *might* take too much to lovin' bee-huntin'; not I got anything agains' bees, thes so; but we has now fourteen or fifteen gums, an' more honey than we know what to do with, an' the huntin' an' takin' o' bee-trees ain't what I should call the indus-trest an' ekinomic'lest practice fer a boy that's got nuthin' an' expects to *have* nothin'. But — an' oh it was right funny — the first time he went with Lawson to a takin', he dis'membered what Lawson told him about dodgin' the things, 'stid of fightin' 'em, an' they got at him to that, Lawson sent him straight back home, an' that boy say he got no stomach for that business no more. But Milly; well a body wouldn't of believed it; but nothin' please *her* like follerin' Lawson up an' down, fishin' an' bee-takin', an' Lawson say she no more 'feard of a eel or a bee then him. It actuil seem like Lawson have a-dap' Milly 'stid of Jes. Well, them little things 'livens up the house more than a body could of expected, special' me an' Lawson. Even Creecy got more riconciled to 'em, special' sence she see how willin' they is to wait on her. They isn't no tellin', cose, not this soon, what the up-shot of it'll all be; but I ken not *but* hopes the good Lord 'll let some good come out of it; for it do 'pear like He put 'em on us. Lawson say he hain't a doubts of *that*."

The years that elapsed until Jesse was nineteen and Milly fifteen had seemed to establish that it was a blessing to them to have been orphaned. Their gratitude had been evinced by strict obedience and the faithful performance of all tasks. Jesse, fully grown in stature, was a stalwart, right handsome fellow, and was now general manager of plantation affairs, the thoughtful habits of Mr. Wimpy having grown more and more settled. Milly was rather undergrown for her age, but round and plump, and in her way as industrious and as useful as her brother. She helped to make clothes for the family and outsiders. She ironed delicate, fragile garments with a nicety

that Miss Faithy declared superior to her own, owing, Miss Faithy argued, to her having such little hands. Yet those same hands could work up as nice a pat of butter as was ever put into a bucket, and set at the mouth of that spring; and if it is necessary to say any more on that subject than that, I know not what it is. Although she had given up following Mr. Wimpy in his sylvan pursuits when Miss Faithy considered that they were less suited to her age and sex than those appertaining to the house and yard, yet occasionally, when work at home was not pressing, or it was thought that she needed the recreation, she

"YOU, JES PRINGLE, DON YOU PUT THEM HANDS ON ME."

would wander with him on fine days, and be as docile as he could wish to his lessons on the mild mysteries of the woods and streams.

Of education, two whole years, counting up all, had they gotten. The good people who had taken them in their destitution had reason to be a little proud of the results.

"That Jes," Miss Faithy would say sometimes, "he can fill a whole slate that full of figgers, that Lawson, an' Lawson were *always* called good at them, even he say that same Jes can work a sum in intrust in more ways an' longer ways than *he* ever learnt. Now as for Milly, she mayn't have the head for actuil figgers like Jes; but Betsy Keenum, you try to

fool that child in the countin' o' what things will come to! An' she write a handwrite another sort to me or Creecy other, an' she can bound an' tell capitals to that, that sometimes I thes love to set an' hear how she do *pronounce* them names in jography, an' which some of 'em I do think on my soul they're the outlandishest. Ah, well, people oughtn't to brag; but it ain't ev'rybody's childern, an' them of their own flesht an' bloods, that is so very far ahead of them childern; an' the good Lord know ef we've missed what we tried to do fer 'em, me an' Lawson, we don't know it. Creecy, but Creecy have been married onct, you know, an' I've notussed,—not *you*, Betsy, for marryin' never made you that kind,—but it's cur'us how marryin', an' special' them that has come to be widders, can lay *sech* a stow on what they know more than me, which have kept singuil an' would do it forevermo', ruther than take up with sech as Red Copelin; but which he's dead an' goned, an' I got nary word to say agin him. But Creecy let them childern wait on her, coold an' calm; an' ef they was to leave that house, *she* mayn't know it, but I do, she'd miss 'em, an' special' that Jes, which it look like she never git tired callin' on him for one thing 'an another, an' he's thes as obleegin' as if he belonged to her."

Within the last year or so Mrs. Copelin had seemed to have become fully reconciled to the presence of the orphans, especially the male, calling him "Jesse" instead of "Jes," and being condescending and polite to him to a marked degree. Her brother and sister had been called "Uncle" and "Aunt" from the beginning; but she had shown to the comers, in a manner that meant insistence, the wish to be addressed as "Miss Creecy"; for ever during her widowhood she had felt and believed that she looked much younger than she was. Satisfied that if she should have the opportunity, she could make more out of some man than had been possible with the material of her late husband, she had been surprised, and to some degree disgusted, that such opportunity had not presented itself. The late increased cordiality between her and Jesse began to be remarked by Mr. Lawson and Miss Faithy; but they were not people to meddle in matters that they knew it was not their business to control. Lately, also, a nearly grown boy named Joshua Perkins had been coming to the house, and more often than he had come before the happening of an occurrence in which the family's feelings somewhat, Miss Faithy's considerably, had been hurt. Simon, the foreman, one morning at daybreak noticed a brindle dog sneaking from the sheep pasture, where in was found, immediately thereafter, a

favorite ewe and her lamb that had been killed. On Simon's testimony that, as well as he could judge with what light the dawn shed, it was Josh Perkins's "Watch," Miss Faithy sent a request to Josh to have the dog killed.

"My goodness alive!" exclaimed Josh, "the whole neighborhood's full o' brindle dogs. Got two over thar yourselves." "And Josh Perkins, he *thes* 'fused to kill the varmint," said Miss Faithy to her brother.

"Oh, well, Sis' Faithy," he answered, "you know 'twere 'nigger everdence,' an' that not downright pine-blank."

Miss Faithy usually followed her brother's judgment when she had appealed to it, and so the matter was dropped. But when the youth's visits began to be more frequent than before, the good woman's mind took on an anxiety that she had never expected to feel.

III.

MR. LAWSON WIMPY has not been made very prominent in this history thus far. Indeed, he never became so except in cases which Miss Faithy, the head of the family, regarded too emergent for her individual control. During nine years he had pursued calmly the career that seemed to befit his meek, unambitious spirit. His interest in his favorite pursuit had received something of an additional spur during the period that little Milly used to accompany him; for we all have seen that the presence of childhood, especially young girlhood, innocent and dependent, serves to add activity to the gait and impart some juvenility to the heart of a man who otherwise might grow old faster than his years. After her withdrawal for the purpose of learning and taking becoming interest in things suited to her sex, a change very gradually came over him. Not that he gave up his piscatory habits or his bee-huntings to any very marked degree; for Lawson Wimpy was an honorable man, and one that always had wished to be consistent and true to his loves and duties. Many a time had he acknowledged that it was his nature, and he couldn't help it, to love a bee; and it was one of his few boasts that not many people ever took a bee-tree or a bee-gum with less sacrifice of life than himself, or left to those industrious insects more liberal allowance of the booty for which they were besieged. He would go so far sometimes as to say that it was a duty that people owed, not only to themselves, but to bees *themselves*, to tame them out of their savage state, and reduce them from the wild tree to the peaceful gum, for that such reduction made them not only more useful, but more happy.

"My bees knows me well as they know theirselves; an' my opinions is they not only satisfied but riconciled to ruther bein' thar than in anybody's woods, makes no odds whose woods they is."

In the abstract, therefore, he was little changed, if any. Yet within a year or so last past, his wanderings from home were less frequent, less distant, less protracted. More than had been his wont ever before, he sat in or about the house and rendered help whenever needed and becoming in the house-tasks of the ladies, such as filling quills for their spindles, reeling their brooches, winding their balls, warping their hanks, handing their threads, and threading their sleighs. Such services and similar were given especially to Milly, needful as the child was of what helps she could get. Often when Miss Creecy would call upon her for a gourd of water from the spring, he would go for it in her place, and that made such calls come at more reasonable intervals. His favorite seat, outside of his dwelling, was on a bench beneath a large, wide-spread sweet-gum that stood near the margin of the stream, below the spring. Here for many years in suitable seasons he had been used to sit with face directed towards the adjoining woods, and watch the bees as they came to drink. Lately he had been conscious of feeling less lively interest in the thoughts that hitherto had occupied him mainly when in this quiet retreat; but he had not spoken of the change to anybody, not even to himself; and he had been thinking if it would not be well to rouse himself from this incipient supineness. One afternoon as he sat at this accustomed seat with a sense of something like revived interest in what used to be so dear, Joshua Perkins, who had asked for him at the house, proceeded to the spring. They had barely saluted when the visitor, seating himself, said abruptly, but with evident embarrassment:

"Mis' Wimpy, come to ast might I cote Miss Milly, sir."

Mr. Wimpy, not given to starting, did not then. Looking at Josh for a second, he turned and for some moments contemplated the spring, and for some more the adjacent woods over as large a part of the circle as his eyes could range without shifting his position, after which he rose, and, turning, looked up the hill towards the house. Then he walked several times the length of the bench on either side, closely scrutinizing Josh, back, front, sidewise. After several minutes he resumed his seat and said:

"Josh Perkins, who you say — that is, you said anything to Milly?"

"No, sir, I has not."

"You has not?"

"No, sir; not nary word."

"I would of supposed not," rather as if soliloquizing, "bein' as she have only thes here awhile back drap her pant'letts, an' him, I'll lay a jug o' honey, not cut nary one o' his wisdom-tooths." Then he asked very pointedly:

"What you come to me 'bout it for, boy?"

"I hear Missis Keenum say that she have heerd Miss Faithy say nobody needn't ever go 'bout co'tin' Miss Milly 'ithout they first git the fambly's permissions."

"Well, my friend, did Missis Keenum tell you Miss Faithy was me, or that the fambly was me? Ef so, she were slight mistakened."

"No, sir; oh, no, sir; no, sir," Josh answered quickly, regretful for the possible mistake that had been made as to Mr. Wimpy's identity. "Of course Missis Keenum, leastways I s'pose she didn't cose, an' so did I, know you bein' of a man person an' the heads o' the fambly —"

"Now, boy, stop; stop right thar. I no sech a heads, an' I got nothin' to do 'ith — 'ith nobody's co'tin's; an' special' childern's. I got nothin' to say, an' I'm busy this evenin', ef that all what you come to see me about."

"Well, good-evenin', Mr. Wimpy. Glad you got nothin' agin me. Hoped you didn't."

"You knowed I didn't. Good-bye."

After the youth had gone, and while Mr. Wimpy was marshaling the thoughts that were now on his mind, an incident, regarded by him ever afterwards more strange than any other throughout his whole history, occurred. A bee, fierce, swift as a bullet, came butting him plump in the forehead, then rebounding sought the streamlet. After he had taken his fill, he rose again and made for his lair. Mr. Wimpy knew from his line that it was a new bee. I say not what that man would have done a year ago. He rose indeed with momentary alacrity, and noted with old-time precision the retiring beast.

"You little cuss, you! It were ruther the impidenst dar' I ever got from any o' your tribes; but — no, I got no time to be foolin' 'long of you now. You go to grass."

Now, why had he not time? He sat down again and asked himself that very question. The days were in the very solstice of summer, the wheat had been harvested. They were nearly through with reaping the oats, hardly a bunch of grass was to be seen in the cotton-patch, the field peas were up and doing splendidly, and the corn would get its plowing, and without need of haste, inside of a fortnight. For some time he continued to investigate himself. His sister Faithy had always said he was deep, and he knew he was. But the bottom of those profound depths was further than even himself had known or suspected. He rose at length, and without intermission of his soundings, followed, with some hesita-

tion, his legs, which took him first to the wheat-field. There, mounting on the fence, he whittled a splinter wrenched violently from a rail and contemplated for a minute or two the fattening hogs rioting in the good gleanings. Then throwing away the splinter as if it were a thing unclean, he shut and pocketed his knife, and proceeding to where they were at work among the oats, he silently took from Simon's hands his scythe, made six enormous swaths, then, handing it back, returned to the bench, under the sweet-gum, where he remained until called for supper.

"What did Josh Perkins want to see you about, Brer Lawson?" asked Miss Creecy at the supper table. "Did he 'pologise for not killin' that mean dog? He ought to."

"He never mention dog in my presence, Creecy, not onct. It were some business Josh thought he had with me, but he found he were mistaken."

"Somethin' on top of Brer Lawson's mind," said Miss Creecy, when quite earlier than usual he had retired; "he never opened his mind exceptin' to answer my question the whole night, an' not answered at that; an' onct when he have retched for the biscuit, he come mighty nigh a-dabbin' his hand in the honey-bowl."

Miss Faithy had noticed the unusual absence of mind and taciturnity, but had thought best not to speak of it. Just at that moment his voice was heard from the doorway, and, if rather sepulchral, yet, after giving an account of the remarkable occurrence at the spring, extending an invitation to Milly. As his coat was off, he stood in the dark.

"From the size of the lick the little rascal give me, I think they mus' be a power o' honey, an' I thought Milly, ef she feel like it an' can spar' the time, might go 'long 'ith me."

"Law me, Lawson," answered Miss Faithy, "the whole back g'yard'n palin's is thes linded and bounded with bee-gums now."

"Besides," put in Miss Creecy, "I *did* want Milly, if Sis' Faithy could spar' her, to begin on the stitchin' of my new petticoat to-morrow, Brer Lawson."

"Hold on, Lawson," cried Miss Faithy, as she heard him going back, "hold on; would you want to go, Milly?"

"Yes'm, if Miss Creecy could wait for the beginning on her petticoat till I got back."

"Yes, Lawson. Yes: the child need some ex'cise, anyhow."

Miss Creecy thought how much less difficult it was to get service from Jesse than from Milly. But she did not complain.

"Go 'long now an' enjoy yourself with your Unc' Lawson, an' don't git stung by none o' them bees," said the good Miss Faithy to her ward the next morning.

The hunters set out shortly after breakfast, Mr. Wimpy, besides his professional tackle, carrying the biggest bucket for the spoil.

"Why, Unc' Lawson," said Milly from behind, when, after a momentary glance upward, he began to advance from the spring, "seems to me you took mighty little sighting before you started."

"Never mind, Milly," he answered without pausing; and if she had seen his eyes, even without experience in woodcraft, she would have known that their uncertain gaze was not apt to lead to a place that very careful search was necessary to find. Not only this, but looking not fully but somewhat over his shoulder as he leisurely proceeded, he chatted with her, directing his remarks mainly to the fact that it was an uncommonly fine morning.

When they had traveled near half a mile, they reached a small knoll flat at its summit, whereon, besides towering oaks, was a pretty thicket of haw and crab-apple trees. At the bottom on one side was a spring. Here Mr. Wimpy came to a stop, and they sat down on a huge log that lay there.

"That bee belong some'rs about along in here," said Mr. Wimpy indifferently. "My mind, arfter we started, got to runnin' on my parrents, an' it be'n a-knowin' it weren't egzactly follerin' him on the line he made. Howbesomever."

Drawing from his pocket a small gourd, and rinsing it carefully, he dipped from the spring and handed it to Milly.

"Well, Unc' Lawson! a better gourd of water I *never* drank. I declare it's as good, I do believe, actual, as our spring at home."

"Thar now! I knowed she'd be obleeged to acknowledge it."

And he laughed as a man laughs after winning a long-contested dispute.

"Fact o' the business *is*," he said, after a brief enjoyment of his victory, "my father wanted to settle right thar whar you see them haws an' crab-apples, an' he begun on a clerrin'. But my mother she want to live closer to the road; an' when he found the spring we has at the present, he let her persuade him over; but he *allays* said ef Sis Faithy er me should take notion to take other kimpanions an' sip'rate, right here were the place for them that moved away to settle theirselves; an' so the question in them ewents, not a-countin' in Creecy which have had her sheer, the question will be thes betwix' me an' Sis' Faithy, an' it'll then be which is which. Ahem!"

"Law, Unc' Lawson!" exclaimed Milly. "The *idea* of your an' Aunt Faithy a-separating! I never *dreamt* of such a thing excepting one of you was to die."

Casting his eyes into the forest far as they could penetrate, he said mildly, solemnly:

"They is sip'rations, Milly, an' they is diwisions, that people ain't *always* obleeged to die before they're fotch'd about. In cose Sis' Faithy, an' special' me, which is younger'n what she call fer, yit she, let alone me, might be counted on, by good rights to live, fer lo those many a year. I'm not talkin' an' I don't know as I shall ever be talkin' about myself, though I don't say them words; *but* ef Sis' Faithy,—mind, I say *ef*, Milly,—an' ef she was to do like some like Creecy expect to do, an' mayby *Jes* for all I know, then an' in those ewents, when Sis' Faithy have took a kimpanion, the queschin in that solemn hour will be thes betwix' Lawson Wimpy an' his lone self, an' it'll be what's what, thes so, pine-blank an' pinte'd, an' nothin' else."

He then turned and looked Milly in the face. Now, the fact was that Mr. Wimpy had not the slightest suspicion of any wish or expectation of his elder sister to marry. Later on it was asked him how it had gotten into his head thus to frighten a timid, dependent child, and he answered, coldly, boldly:

"Instinc'. 'Tweren't nothin' but instinc'; the same like what a bee have."

"Oh, Unc' Lawson," said Milly, much disturbed, "how can you think such things about Aunt Faithy? I can't believe——"

"Ef you'll 'member, Milly," interrupted he, apparently cold as the water from which they had just drunk, "that I was only thes a-supposen' about Sis' Faithy, an' then a-astin' o' myself, what was what in them cases."

Milly, looking back with some anxiety, said:

"Haden't we better go back, Unc' Lawson, sence you missed the bee-tree?"

"Well, mayby, yes," drawled the man with an unconcern that seemed perfectly heartless. "Possible we well go back. I hain't give up that bee, howbesomever. The bee don't live can give me sech a dar', right plump in the forrid, an' I not trace him to his den, some time er 'nother when I in quindition to pro-jeck as I knowed I weren't to-day. Sis' Faithy, you know, Milly, know nothin' o' sech as the present convisashin, an' onlest you think it's the best to tell her about it, fer in things that is both dilicate an' interestin' at the same times, it mayn't always be best, that is, in cose, my meanins' is, not ontwell they're fotch out by the warious circum'ances an' sichiations, so to speak; ahem! we'll proceed on back, ef you ruther."

"Yes, sir, Uncy, I *know* Aunt Faithy an' Miss Creecy needin' me this minute."

Not willing to return entirely empty, and as the season was late for honeysuckles and jasmine, Mr. Wimpy would linger to gather a

good supply of red-buds, sweet-bottles, and Carolina pinks.

If Miss Faithy had been in laughing mood, oh, how she might have gone on at sight of the results of a hunt, so boastingly set upon. As it was, the returning party found her in the act of applying to her lips the blowing-horn. Laying it aside, she almost pushed Milly into the house, saying:

"Go in, child; go in an' try to prepar' fer what's a-comin'." Turning to her brother, she said:

"Lawson, my gracious me! Josh Perkins have come by here on his *way* from town, an' he *bring* the news that Sol Pringle have got back, an' have *employed* lawyers to sue for Jes an' Milly, an' damidges to boot."

"The everlastin'!" But instantly recovering his poise, he took his sister by the hand, and led her to the spring. From all that I could gather of the talk and counsel then and there had, in no previous family emergency had more earnest, wise thoughts ascended from the great deep of Lawson Wimpy's being. Not fully comprehended at first and therefore not fully satisfying, yet, Miss Faithy when she rose and started back for the house, felt that if there was nothing else for an unhappy one like herself to be thankful for, she ought to get upon her knees for having such a brother.

IV.

THE head of that family used to declare that "tongue could not *begin* to tell the egzitements of *that* night, nor the follerin' day." I confine myself to a few facts and conversations.

The subject of all thoughts was not one for discussion in family conclave. There were some points that had been submitted by Mr. Wimpy at the spring that involved delicacy, and if manageable at all would be managed only by talks in couples. Jesse and Milly had their talk, so Jesse and Miss Creecy. Here Jesse showed that he felt himself to be a man with a man's courage, and Miss Creecy said that she would back him to the utmost. A brief talk Jesse had with Mr. Wimpy, in which each hoped he understood the other. Poor Miss Faithy, after her first talk with her brother, was so shaken up that she could not speak, except mere irregular snatches of words, first to one, then another. However stirred away down in his depths, Mr. Wimpy's surface was calm. Just before retiring he said generally:

"If Creecy weren't sech a rapid rider, I'd be willin' for her to git on Dolly to-morrer, an' go to town, an' ef it took a day or two, to stay thar, an' gether what's to be gethered about Josh's news. People don't know how to *ack* tell they see whar they *stan'*. But Creecy sech a rapid rider."

Now, Miss Creecy was fond of going to town, and especially on her brother's riding nag. So she answered:

"Dolly know I never ride her to hurt. I'll go ef people want me."

"Be it so, then," said Mr. Wimpy in quick answer to Miss Faithy's doubtful look.

They retired early. After weeping in each other's arms until Milly fell asleep from exhaustion, Miss Faithy, disengaging herself, rose, and when not upon her knees, paced the hall-room and piazza for several hours. Occasionally she tiptoed to her chamber door, and listened as if to be reassured if Milly were still there and still asleep. At length she lay down again, and placing one arm under Milly's neck, and the other across her breast, sank into the sleep that, in spite of tribulation, comes to the good and charitable. Long before all except her brother had awakened, she was up and dressed. Approaching softly to call Mr. Wimpy, he issued from his chamber, with face as on yesterday newly shaven, and if that man ever did the like before on two consecutive days, nobody ever heard of it.

"Lawson," she said, in subdued but resolute tone, "I want Storm kep' onchained to-day, an' I want the hounds to stay about the house."

"Cert'nly, Sis' Faithy, ef you say so; but I 'spose people *ought* to know that dogs, no marter how bitin' they is, can't thes by themselves keep a' officer o' the law off a place, whar the jedge send him."

"I know that well enough; but they can keep off robbiers, an' house-breakiers untwell people can gether their senses to find out what to do."

"What I told you yistiday, Sis' Faithy, *at* the spring, is the onlest way that is lawfuld an' effecuil. Jes an' Milly, though they ain't actuil *childern*, what people *call* childern, yit they're what the law o' Georgie call *minders*, an'll be minders tell they're one an' twenty apiece, an' Sol Pringle, a-bein' of their natchel fathers, can lay in his claim o' titles to 'em *a-thout* they marries theyselves off, an' in which ewents them titles has nother law ner gospil."

Lord Thurlow could not have laid down in firmer tones the law of estoppel.

"But, Lawson," Miss Faithy insisted, "in the *name* o' goodness, what good an' what consolation to *me* would be fer Milly to git married an' go from this house; an' as fer Josh Perkins, which you say he want her, why, the child despise Josh Perkins in her sight, an' she say —"

"She do, do she?"

"Yes, she do, an' as for Jes an' Creecy, Milly say she don't believe that so; an' ef it was, that no business o' mine; fer you know how hard it is to git along with Creecy

now, when she nothin' but a widder, an' what would it be —"

"Say Milly don't take to the idee o' Josh?" He did not appear to have heard his sister's last remarks.

"No, she don't; an' she say she'll thes die ruther'n she'll other have Josh Perkins, or leave me to go 'long with her pa."

"Don't Milly know then, Sis' Faithy, that Josh Perkins not the onlest marryin' man-person in the *world*?"

Mr. Wimpy looked as if he suspected that Milly must have taken Josh Perkins to be Deucalion.

"I don't 'spose she do, in cose; but the child nothin' *but* a child, an' her head not been runnin' *on* men, an' my laws! when she were a-layin' on that bed arfter cryin' of herself to sleep, she look like a blessed angel."

"My, my, my, my, my! *That* don't seem to do then; an' as you say Jes an' Creecy a-jindin' poplars, even ef they did jind 'em, would be monst'ous little consolation to me an' you. An' Jes is a—I tell you, Sis' Faithy,—Jes Pringle's a *man*, an' ef he have the chance he'll take—I come nigh a-sayin'—he'll take his place among the people o' this whole section o' country."

"What *is* to be done in sech a case?"

"Sister Faithy, my advices is to say not one word to nobody; not untwell Creecy git off to town, an' arfter that for you an' Milly to have a talky-talky betwix' yourselves here at the house, an' me an' Jes will go to the spring. For in the case we got on hand, the wariuous seck of people can talk to more adwantages, an' special on subjecks that's dilicate, an' skittish to boot; that is fer a while; an' Milly, by good rights, ort to try to find out that they is in cose other an' defferent people besides of Josh. As for Jes, Jes in cose know his own mind. Better go in now. I hear 'em a-movin'. Try to be calm, Sis' Faithy, an' special, try to be coold."

After breakfasting at sunrise (their usual hour), as Miss Creecy was mounting upon Dolly, her brother said:

"Lemme see. This is a Chuseday. I'll look fer you a Thursday night, though I has my doubts ef you can pick up ev'rything about them solemn perceedances before a Friday. But, Creecy, do don't ride Dolly too rapid, an' ast Mr. Leadbetter to see that she's fed an' give water reg'lar. Howsomever, good man like him won't let a po' beast suffer. Good-bye."

The auxiliary influence of a broom in her hand to a woman of spirit when feeling that she has been treated or threatened wrongfully was always remarkable. I could not say how many times in imagination Miss Wimpy swept Mr. Solomon Pringle out of that house and

piled him up in a heap on the ground to be burned. The while she made Milly sit in full view on the piazza. Milly looked sad, like the daughter of Epimetheus after the flood, still there were signs upon her face of innocent hope. Her Aunt Faithy was too full for much utterance beyond frequent painful ejaculations, some shorter, some longer than this:

"My laws of gracious mercies! Ef that child is took away from me, it'll *thes* kill me."

When not another speck of dust was to be seen, still holding her broom, she took Milly's hand, and drawing her up, said:

"Come, child, less go to the spring where your Unc' Lawson is. I hope to the good Lord, Lawson got some senses left. I've not."

Hand in hand they set out. As soon as they appeared, Jesse rose, and walking rapidly up the acclivity, met them under a white oak with low-hanging limbs.

"Milly," he said, "Unc' Lawson want to talk to you on some partic'lar business. I don't know as I ever thought as much o' Unc' Lawson as I do this mornin'. Aunt Faithy, I want to speak a few words to you, if you please, ma'am."

His face was flushed. Miss Faithy, as she afterwards often declared, "*thes* knewed some-thin' were on his mind."

"Aunt Faithy, I made up my mind not to go with pa no more, an' I'm a-goin' away from this place 'ithout you say I sha'n't, an' that is, ef you'll have me."

"Have what!" she gasped. "My laws! What do that Jes mean?"

"I mean ef you'll have me for your husband, to love you, an' work for you, an' take keer of you, an' fight for you, an' die for you, an' do ev'rything upon the top o' the blessed ground for you."

She caught with one hand at a limb, that swaying to her pull, it looked as if she must fall. Jesse was extending his hand to help, when she instantly recovered herself, and raising her broom, cried in a tone not loud but most threatening:

"You Jes; you Jes Pringle! Don' you put them hands on me. Who? What put that in your head, Jes Pringle? Lawson? I didn't think Lawson keered that little —"

"Aunt Faithy," quickly interjected the youth, "*that* Unc' Lawson didn't. He never hinted sech a thing! an' he never dreamt o' sech a thing, tell I told him last night. I be'n a-lovin' you ever sence I be'n here, an' a-wantin' to marry you for this two year an' better."

"Well, I always did believe this world were comin' to a' end before people was a-cal'clatin', an' now it's done done it. Bless my soul, where's Milly? I forgot all about that child."

"Milly down at the spring settin' by Unc' Lawson under the sweet-gum, an' ef she have

the sense I think she have to git out an' keep out a shower o' rain, thar whar she goin' to stay an' settle herself a endurin' life."

"What? The world a-comin' to a' end thar too? Jes Pringle, go 'long; go 'way. Don' say nothin' more to me now, boy. I got no senses to talk back at you. I'm that 'shamed o' myself I got to go an' hide. What *will* Creecy say? The good Lord know, I thought ef it were anybody here that boy were *that* foolish an' crazy about, it were Creecy. Go 'long, Jes; go 'way. I don' say go *clean* away; but go long off som'rs by yourself, an' combit yourself to the hands of the good Lord, an' ast Him to let you know ef you *in* your senses er ef you done gone ravin' distracted."

She strode on to the house weeping and striving, but striving in vain not to look back at the lover who steadily followed.

v.

BETIMES the next morning Jesse Pringle set out for the county-seat to attend to a little matter of business that Mr. Wimpy and himself thought might be dispatched as well now as later. Not very long after his departure, Mr. Wimpy made a brief but pleasant visit to the Rev. Mr. Sanford, who dwelt near by, a highly respectable and much-beloved minister of the gospel. The visit was returned about nightfall on the same day, the excellent gentleman accompanied by Mrs. Sanford in the gig, and followed by their grown-up son and daughter on horseback. The rest I think proper to let be told by Mrs. Faithy (*née* Wimpy) Pringle, as was done some weeks afterwards to her friend Mrs. Keenum.

"What I went through with them two days before they was wound up *by* Brer Sanford in the presences of *them* witnesses, I never had expected sence the days an' *hours* I was borned. Flustered as I were when I first heerd of Sol Pringle's comin' to claim them childern, it were nowhars like I was flustered when Jes named what he did; an' I were that 'shamed *an'* mad, ef I'd *had* of had my strenkt, I'd of hit him with my broom, which I were holdin' *in* my hand to help me to 'fend off *some* of the troubles that was on me about the losin' of Milly. But thar, Betsy, were whar I were lackin'. When that boy, that Jes, fasten them eyes of his'n on me, an' named what he did, Betsy, Betsy Keenum, I were that weak an' that charmed that it wouldn't of be'n defferent ef it have be'n a rattlesnake; an' it struck me suddent as thunder that I loved the boy and didn't know it, an' ef I had, I'd of died before I'd of acknowledge it. An' then, lo an' behold, thar was Lawson *at* the spring a-werryin' Milly *thes* like Jes a-werryin'

me *under* the white oak. An' Milly, poor little thing, she helt out an' declar'd she thes wouldn't 'ithout her Aunt Faithy say so, an' she done the same 'ith Jes. An' I driv' Jes off, an' Milly she runned from Lawson; but they followed us plump in *to the very house*. An' I pleaded an' *pleaded* 'ith Jes, that ef it have be'n the will of the good Lord, I were old enough to of be'n his own lawfudl mother. An' Jes he come back at me amejiant, an' he say, that as sech were *not* His will, it foller as a natchel conshekens, it *were* His will fer me to be his lawfudl wife. An' Lawson then he up an' say he never heerd a more clinchiner *argument* than Jes have use, an' that he have me whar I couldn't cherrip. An' it did look like the boy did. An' *so* we had it *up* an' down all day long, Creecy, she gone to town, an' *nobody* to help stop their pessecutin' untwell finiul me an' Milly, to get some peace *in* our mind, we thes had to knock under an' give our consents. An' then Lawson, Jes him a-backin' him up, argy that we well have the business settled accordin' to the law *an'* the gospil, so Creecy could git reconciled quicker to the way things was a-goin', an' Sol Pringle could see for hisself that as for his claim o' titles to them minder children, he were at the end of his row an' a-barkin' up the wrong tree."

The bride paused, and after a brief rest resumed:

"An' yit, ef you'll believe me, child, a-not-withstandin' all I be'n through before, when I hear Brer Sanford an' them a-comin' an' me an' Milly settin' thar with our white frocks on an' what few taslets we could *gether* up, an' Milly, she were coold, same as a cowcumber, but *me!* Betsy Keenum, I were that 'shamed that ef it have be'n lawfudl an' decent, I'd of

not let Jenny lit candles, but of ast Brer Sanford to pe'form his cer'monies in the dark. An' I *do* think he use the pootest words about marryin' bein' honerble an' to the app'intment o' scripiter. An' *when* he put up that pra'ar I couldn't of holp from cryin' ef I'd of be'n a-dyin' 'stid of beginnin' on a new life."

After another brief pause she continued:

"But I'm thankful that before so very long I got another sort more riconciled an' compoged in my mind. An' them come quicker when Creecy an' Mr. Pringle—look like they done it so quick to spite me an' Lawson,—but tell you the truth, me an' Lawson was glad when they married suddent that way, because bein' his sons-in-law, and daughters-in-law both, we was bound to support him, an' we settled 'em back on the place whar we give Creecy ag'in, an' it 'pear like they livin' very kintented in thar mind, a-knowin' me an' Lawson not goin' to let 'em suffer. Lawson already a-buildin' by our other spring whar he showed Milly the very mornin' of the day the fracasas begun. Oh, he's deep, Lawson is! Him an' Milly calm an' gayly as two young pullets, or, ruther, him bein' a man person, I'll say two young kittens. It please Lawson an' make him laugh when Milly ketch him by the jaw an' tell him she wouldn't want him to be a day younger. But Jes know I don't want no sech talk about me. Yit Jes good to me as he possible can be. Ah, well," she ended, wiping her eyes, "I can but hope the good Lord'll send His blessin' on a poor sinner in the takin' *sech* a venter at this time of life. He know how many times I drap on my knees what little time I had before it all taken place, an' He know what my daily pra'ars is now to the throne of grace."

Richard Malcolm Johnston.

AN INDIAN HORSE-RACE.

N the summer of 1879 we — that is, the American people — were trying to settle the Methows, Chelans, Weenatchees, and half a dozen other tribes upon the reservation Secretary Schurz had marked out for them. Although there was to be no compulsion used, still homes were to be broken up; many of the interested parties had been hostile only the summer before, and concessions were to be made on both sides. Indian negotiations are ponderous. They cannot be hurried. I was the adjutant-general of the expedition, that is to say, the scribe or reporter, and I expected to have none of the responsibility and

all of the fun. The first general meeting was at the mouth of the Weenatchee, in the heart of the ruggedest Alps of America. The great Columbia tore through the mountain pass in a grand sweep, tossing and foaming. This bend of the river inclosed a level plain some mile or so broad, and just opposite the blue Weenatchee came from the mountain glens to join the Columbia. This plain was the council-ground. We arrived first and went into camp. The pack-mules luxuriated in good rolls in the sand, the canvas village arose, and very soon bacon and coffee led us to supper by the nose. Next morning our friends began to arrive. The news of our presence flew in that way so mysterious even

to those who know the Indian's tireless night-and-day riding and system of signaling. Hour after hour the Indians arrived, singly, by families, bands, and almost by tribes, trooping in with herds and loaded pack-animals, men, women, and children—for they brought their homes with them.

The tepees of buffalo-skin were put up, the smoke of many camp-fires arose, and the hill-sides became dotted with grazing ponies. All the life was barbaric. The smoky smell and flavor of everything belonging to these people were not more characteristic than each one of a thousand other things. The picturesque troop just coming in, the shy women in buckskin shirts and leggins (riding astride), their saddles hung with bags, strange utensils, and sometimes the papoose swinging in his swaddling cradle at the pommel; wild-eyed, elfin-haired, little bronze children, perched naked on top of some bales of household goods; the untamed, half-naked boys on their bare-back horses, and galloping along in premature dignity; the motley horde of patient pack-horses loaded out of sight under mats, robes, tepees, poles, pots, bows, spears, guns, and a thousand barbaric things of shape and color defying description. Last, or perhaps first, in the train came the grave, anxious-looking men in fur mantles or loose buckskin shirts, or with yellowish copper-colored, naked bodies, and only the breech-clout and fringed leggins, their hair loose or braided, and their faces painted black, red, yellow, white, whatever color pleased best their idea of an imposing toilet. Each had his gun, perhaps slung in a gayly fringed case, but more generally carried in the hand across the saddle. Then the saddles, most of them of native manufacture, curious, often profusely decorated. The ponies with tails and manes sometimes clipped, sometimes gay with interwoven feathers, and sometimes ears, tail, and mane all cut close to the body in very wantonness of the grotesque.

Then the camp with its wild groupings, its color, its gorgeous setting in the evergreen and snow-clad hills; the eternal snow-peaks high in air against the blue sky; the irregular streets of dusky tepees; the lounging men, the playing children, the sneaking dogs, and the working women! It is the thrilling life of the wilderness. What a pity it should all be passing away and no great artist think it worthy of his brush!

There were on this ground the best horses of the whole North-west, belonging to rival tribes that had been renowned for horses from the time of Lewis and Clark. There were races almost every hour, but the one I choose to describe came off on the last day

of the council, after morning adjournment, so that the elders of the tribe could be present.

The course was a straight stretch of about a mile along the half grass-grown plain between the camps and the foot of the mountain. The starting-point was marked on the ground; the finishing-point was determined by a horse-hair lariat stretched along the ground and held by two Indians, one from each of the competing tribes.

The finishing-point was nearest the camps, and here the horses took their stand, stark naked, save the fine buffalo-hair lariats knotted around their lower jaws. They were little beauties, clean cut as barbs, one a white and the other a gray; the skin fine, the sinews clean and silky, nostrils immense, heads small, bony, necks graceful, slim. I say little, for they were undersized, as compared with our thoroughbreds, though larger than the average Indian horse. Their tremendously deep chests led one to believe the assertion of a twenty-miles' galloping race which the gray had won. By each stood its rider, a young Indian boy, slim and sinewy as his horse, and as naked, save the most meager breech-clout. These horses were each the pick of the tribe to which he belonged, and as a matter of course all the members of these tribes adhered to their own especial steed.

Crowds began to flock to the stand. The racers were examined again and again; hands were passed over their bodies a thousand times, it seemed to me. I believe there are no better horsemen in the world than our horse-Indians. These examinations were made to see that all was sound and fair, and also by individual bettors to aid their judgments. The crowd naturally ranged themselves into two parts, each on the side of its favorite horse.

Presently the owner of the white horse stepped out and threw to the ground a new saddle and a bundle of beaver and other pelts. Some one from the opposing side threw in a separate place a bundle of blankets. This was their wager, one against the other; each would remember it, for now all the bets would be piled indiscriminately in two opposing heaps, guarded by appointed watchers. As each threw down his stake, he must watch who matched it, and with what. If he accepted, well; if not, he refused the bet, and either some other took it up or the stake was increased to satisfy the first bettor. The women and young boys were fringing the outer edge of the assemblage, many of them guarding the household treasures, which were in readiness for their husbands or fathers to stake.

It did not take long for the Indian excitement to grow, and soon the bets were showering down and the pile "swelling visibly" with

ON THE WAY TO THE STARTING-POINT.

such rapidity that it was marvelous how account could be kept. Blankets, furs, saddles, knives, traps, tobacco, beads, whips, and a hundred other things were staked.

Ponies were led apart in two groups, some wealthy Indians betting six and ten ponies at a time. The excitement grew to a fever. The men even tore the robes and belts from their persons and threw them as wagers. They whispered to boys, who hurried to camp and came up with new things.

Squaws appeared with armfuls of buffalo, wolf, bear, and fox robes, beaded garments, brass pots, etc. Their lords snatched these and bet with seeming recklessness. They took ear-rings from their ears and blankets from the backs of their wives (after having stripped themselves almost naked). The women seemed to enjoy this contribution they made to the wealth and pluck of their husbands. The more ardent bet the last pony they owned in the world, leaving themselves afoot, and some risked their rifles on the race. Their rifles are the last things parted with, but under the all-conquering gambling passion these too will be sacrificed and the bow and arrow resorted to till another weapon is procured.

The excitement, the surging crowds, the calling, the hurrying to and fro, the reckless shower of bets forming at last two piles five or six feet high and twenty in diameter — all were in strange contrast to the little jockeys who stood by their horses, apparently all uncon-

cerned, while the betting was going on. Those in charge had fastened around each horse's body a thick horse-hair lariat doubled; this was knotted tightly but hung loosely, leaving a space of several inches between it and the horse's belly. When all the bets were laid, the riders vaulted to their places, and bending their knees, thrust them between the lariat and the horses' sides, thus drawing the lariat very tight and binding themselves like centaurs to their slippery steeds; and yet by simply straightening their legs they could throw off the band and be released.

The racers now walked with long, supple strides down the course to the starting-point, accompanied by the starters, friends, admirers, jealous watchers, etc., some on foot and some on horseback. The whole mile of track soon became a lane hedged by groups and lines of Indians. The intentness, the care, and the suspense were catching. I began to feel a thrilling excitement and an impatience to know which of the beauties would win and which tribe be beggared.

The eagerness to watch the start made them crowd up the track at one end of the line, in spite of the shrill cries of the Indian watchers to clear the track. But the track would be cleared soon enough.

A faint cry at the other end of the line, a whirl of the horses, a tumult down there, a waving of whips, a wild yelling growing nearer, louder, and here they come — flying. Side

by side, the naked riders plying the lash with every terrific bound; the Indians bordering the track packed to a dense mass, surging to and fro, yelling and throwing up their whips; the mounted ones running their horses at full speed after the flyers, but being rapidly left. Here they come! heads out, eyes strained, nostrils stretched, forehoofs seemingly always in the air, the whip-thongs falling with quickening vigor. A hoarse, wild shouting, a deafening burst of yells, a *swish* in the air, an apparition before the eyes, a bound over the finish line, and the race is over, the white just half a length ahead, and there they go down toward the river, the boys pulling them in for dear life.

Ere they were led back the bets had been claimed, each person taking his stakes and those things which had been pledged against them. Other races were made. The piles of wagers grew again, and again dissolved. Bets were all that was needed to prolong the sport, for if the stock of swift horses — their regular "race-horses" — should by chance be exhausted, slower ones were speedily matched. In these intertribal contests the tribe never deserts its own horses, so that if their antagonists have superior animals, the losers will be stripped to beggary. A transfer of property takes place, and the paupers with happy carelessness hobble off with a few sore pack-animals to carry their diminished possessions.

The Indians are shrewd jockeys, but their own races are as a rule fair and honest trials of speed. The decision of the umpires is never demurred to unless palpably unjust, and on these rare occasions the settlement is either by a quarrel or more usually by a renewal of the race. And while an Indian is willing to gamble on anything, even a tortoise race, his true delight, the very exultation of his soul, is

in a long race between horses of wonderful speed. There is nearly always with each band some one favorite steed of supposed all-surpassing powers, and it is the races between these pets of the tribes that inspire the chief interest. The great spring gatherings are among the most picturesque features of Indian peaceful life. The bands and tribes meet near some vast plain or meadow bordered by the forest or the mountains and watered by pleasant streams. Here the women dig the edible roots, and weave mats and baskets. The children hunt in the edge of the woods with mimic bows and arrows or fish for trout in the swarming brooks; while each band bring forth their favorite and trust their fortunes to its speed.

The victor over all for the year gains a wide reputation, and is coveted by some three or more thousand Indians. They cherish their race-horses, but apparently from selfish motives, for in the races they are utterly merciless; the most gallant efforts of a defeated brute seem to inspire neither admiration nor gratitude.

Our assembly was not one of these gala meetings, but with savage thoughtlessness our tawny friends turned from the breathless debating of vital affairs of state to the hilarious excitement of horse-racing. The chiefs, it is true, stood aloof, with a dignity partly natural and partly affected, to impress the white dignitaries; or they mingled in the crowd in a stately way, keeping their keen interest tempered with the gravity begotten by their responsibilities.

After dusk the Indian lads would take possession of the deserted track and run their ponies in break-neck scrub-races.

C. E. S. Wood.

CALM.

HAST thou been down into the depths of thought
Until the things of time and sense are naught;
Hast sunk — sunk — in that tideless under-deep
Fathoms below the little reach of sleep?

Dark, there, and silence; sound is not, nor sun;
The heaving breast, the beating heart, have done:
They lie no stiller whose stopt pulse and breath
Respect the dread repose in realms of death.

Hast visited below, where he must go
That would wisdom's last-yielded secret know?
Hast been a guest where, lost to smiles and tears,
The quiet eye looks on beyond the years?

Hast thou been down into the depths of thought
Until the things of time and sense are naught?
Then toil and pain blend sweet as evening psalm,
Then doubt is whelmed in hope, and care in calm.

John Vance Cheney.

GROUND OVER WHICH PICKETT CHARGED, AS SEEN FROM THE UNION LINES. (FROM A PHOTOGRAPH BY TIPTON.)

On the left is seen the clump of trees which was the point of direction for Pickett's men; also the monument of Webb's brigade near which General Webb was wounded. General Armistead was killed in the middle foreground of the picture; Codori's house is seen on the right. — EDITOR.

THE THIRD DAY AT GETTYSBURG.

BY THE CHIEF OF ARTILLERY OF THE ARMY OF THE POTOMAC.

A PENNSYLVANIA BUCKTAIL.

IN view of the successes gained on the second day, General Lee resolved to renew his efforts. These successes were :

1st. *On the right*, the lodgment at the base of the Round Tops, the possession of Devil's Den and its woods, and the ridges on the Emmettsburg road which gave him the coveted positions for his artillery.

2d. *On the left*, the occupation of part of the intrenchments of the Twelfth Corps with an outlet to the Baltimore pike, by which all our lines could be taken in reverse.

3d. *At the center*, the partial success of three of Anderson's brigades in penetrating our lines, from which they were expelled only for lack of proper support.

It was thought that better concert of action might have made good a lodgment here also. Both armies had indeed lost heavily, but the account in that respect seemed in favor of the Confederates, or at worst balanced. Pickett's and Johnson's divisions were fresh, as were Posey's and Mahone's brigades of Anderson's, and Smith's brigade of Early's division. These could be depended upon for an assault; the others could be used as supports, and to fol-

low up a success. The artillery was almost intact. Stuart had rejoined with his cavalry, excepting the brigades of Jones and Robertson, guarding the communications; and Imboden had also come up. General Lee, therefore, directed the renewal of operations both on the right and left. Ewell had been ordered to attack at daylight on July 3d, and during the night reënforced Johnson with Smith's, Daniel's, and O'Neal's brigades. Johnson had made his preparations, and was about moving, when at dawn Williams's artillery opened upon him, preparatory to an assault by Geary and Ruger for the recovery of their works. The suspension of this fire was followed by an immediate advance by both sides. A conflict ensued which lasted with varying success until near eleven o'clock, during which the Confederates were driven out of the Union intrenchments by Geary and Ruger, aided by Shaler's brigade of the Sixth Corps. They made one or two attempts to regain possession, but were unsuccessful, and a demonstration to turn Johnson's left caused him to withdraw his command to Rock Creek. The scene of this conflict was, at the close of the war, covered by a forest of dead trees, leaden bullets proving as fatal to them as to the soldiers whose bodies were thickly strewn beneath them.

Longstreet's arrangements had been made to re-attack Round Top, and his orders issued with a view to turning it, when General Lee decided that the assault should be made on Cemetery Ridge by Pickett's and Pettigrew's divisions, with part of Trimble's. Longstreet

formed these in two lines—Pickett on the right, supported by Wilcox; Pettigrew on the left, with Lane's and Scales's brigades under Trimble in the second line. Hill was ordered to hold his line with the remainder of his corps,—six brigades,—give Longstreet assistance if required, and avail himself of any success that might be gained. Finally a powerful artillery force, about one hundred and fifty guns, was ordered to prepare the way for the assault by a cannonade. The necessary arrangements caused delay, and before notice of this could be

tillery of the Second Corps under its chief, Captain Hazard. Woodruff's battery was in front of Ziegler's Grove; on his left, in succession, Arnold's Rhode Island, Cushing's United States, Brown's Rhode Island, and Rorty's New York. In the fight of the preceding day the two last-named batteries had been to the front and suffered severely. Lieutenant T. Fred Brown was severely wounded, and his command devolved on Lieutenant Perrin. So great had been the loss in men and horses that they were now of four guns each, reducing

STUART'S BRIGADE RENEWING THE CONFEDERATE ATTACK ON CULP'S HILL, MORNING OF THE THIRD DAY.

received by Ewell, Johnson, as we have seen, was attacked, so that the contest was over on the left before that at the center was begun. The hoped-for concert of action in the Confederate attacks was lost from the beginning.

On the Federal side Hancock's corps held Cemetery Ridge with Robinson's division, First Corps, on Hays's right in support, and Doubleday's at the angle between Gibbon and Caldwell. General Newton, having been assigned to the command of the First Corps, *vice* Reynolds, was now in charge of the ridge held by Caldwell. Compactly arranged on its crest was McGilvery's artillery, forty-one guns, consisting of his own batteries, reënforced by others from the Artillery Reserve. Well to the right, in front of Hays and Gibbon, was the ar-

the total number in the corps to twenty-six. Daniels's battery of horse artillery, four guns, was between Hazard and McGilvery at the angle. In addition, some of the guns on Cemetery Hill, and Rittenhouse's on Little Round Top, could be brought to bear, but these were offset by batteries similarly placed on the flanks of the enemy, so that on the Second Corps line, within the space of a mile, were seventy-one guns to oppose nearly one hundred and fifty. They were on an open crest plainly visible from all parts of the opposite line. Between ten and eleven A. M., everything looking favorable at Culp's Hill, I crossed over to Cemetery Ridge, to see what might be going on at other points. Here a magnificent display greeted my eyes. Our whole

MONUMENT OF THE SECOND MASSACHUSETTS INFANTRY,
FACING THE EAST BASE OF CULP'S HILL.

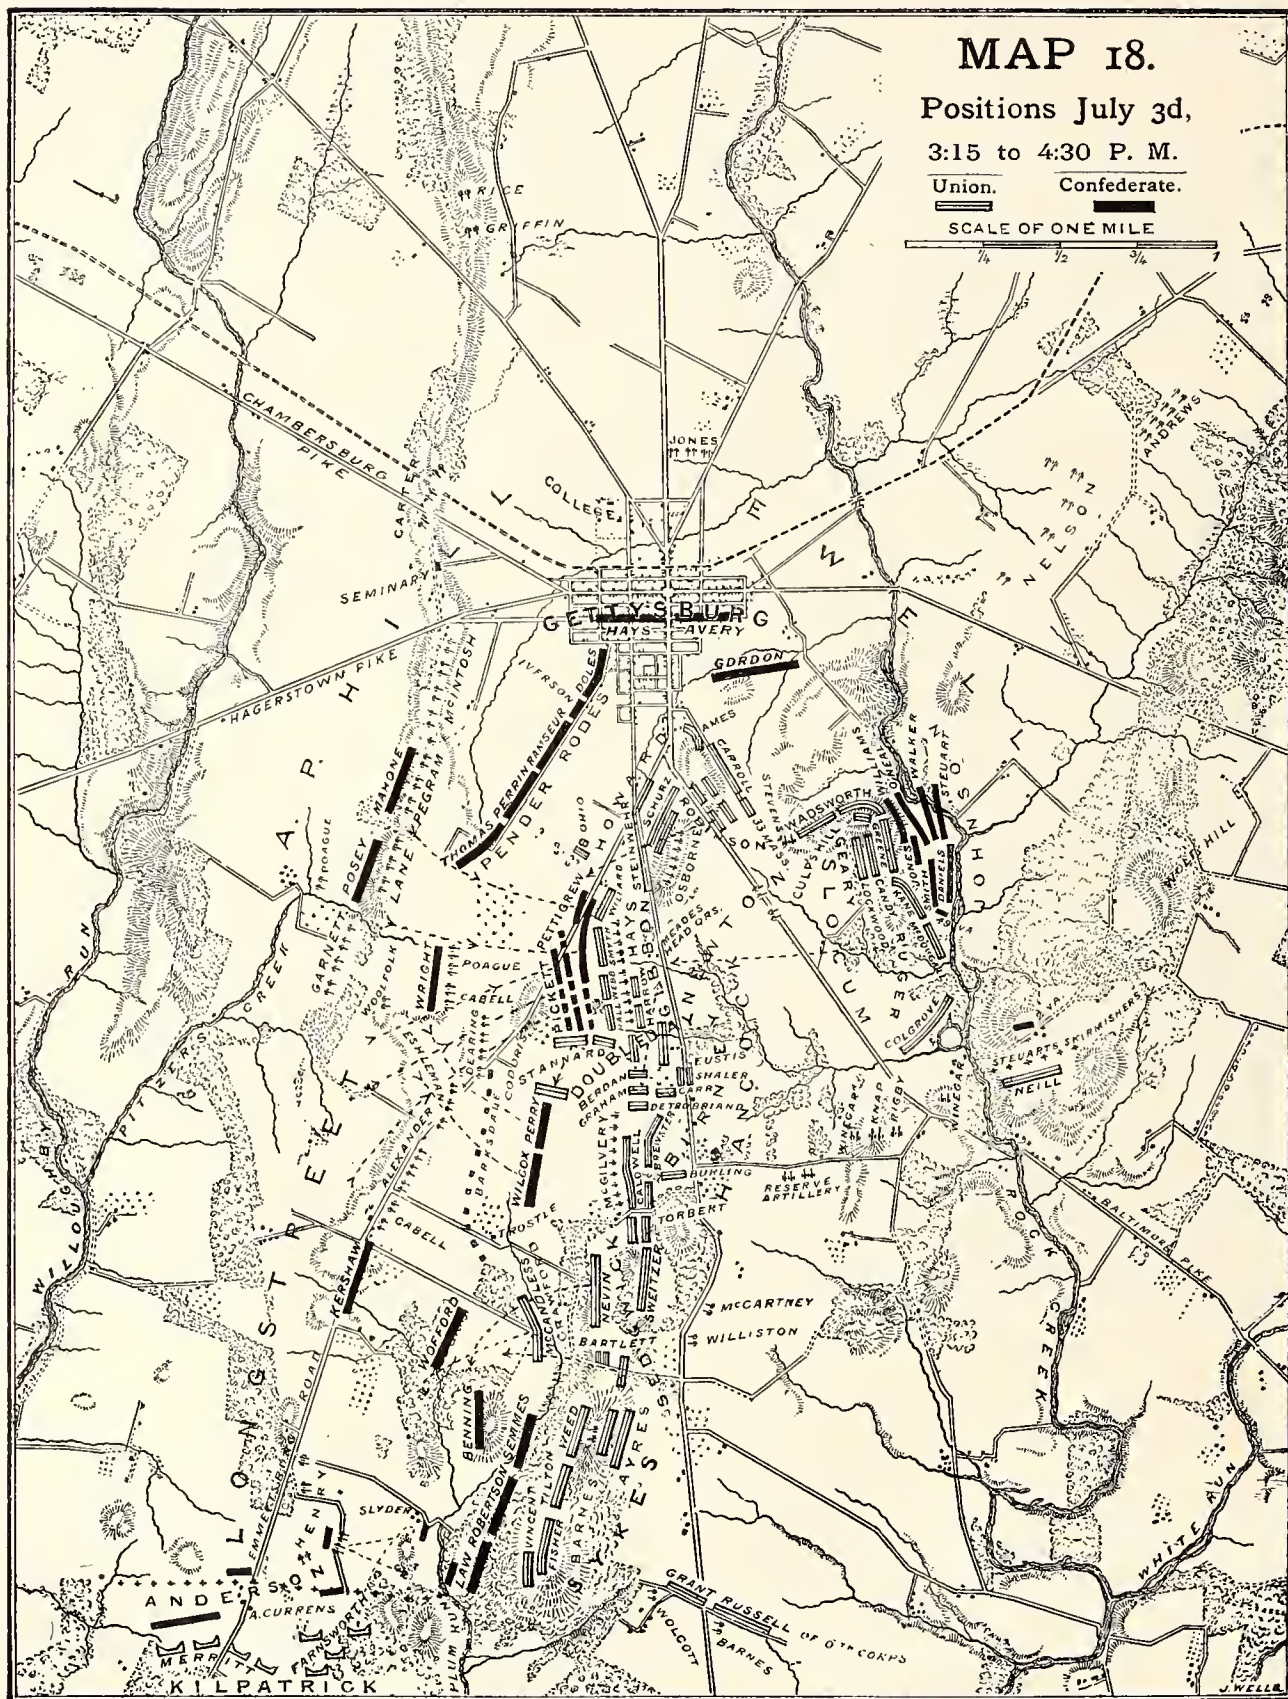

front for two miles was covered by batteries already in line or going into position. They stretched—apparently in one unbroken mass—from opposite the town to the Peach Orchard, which bounded the view to the left, the ridges of which were planted thick with cannon. Never before had such a sight been witnessed on this continent, and rarely, if ever, abroad. What did it mean? It might possibly be to hold that line whilst its infantry was sent to aid Ewell, or to guard against a counter-stroke from us, but it most probably meant an assault on our center, to be preceded by a cannonade in order to crush our batteries and shake our infantry; at least to cause us to exhaust our ammunition in reply, so that the assaulting troops might pass in good condition over the half mile of open ground which was beyond our effective musketry fire. With such an object the cannonade would be long and followed immediately by the assault, their whole army being held in readiness to follow up a success. From the great extent of ground occupied by the enemy's batteries, it was evident that all the artillery on our west front, whether of the army corps or the reserve, must concur as a *unit*, under the chief of artillery, in the defense. This is provided for in all well-organized armies by special rules, which formerly were contained in our own army regulations, but they had been condensed in successive editions into a few short lines, so obscure as to be practically worthless, because, like the rudimentary toe of the dog's paw, they had become, from lack of use, mere survivals; unintelligible except to the specialist. It was of the first importance to subject the enemy's infantry, from the first moment of their advance, to such a cross-fire of our artillery as would break their formation, check their impulse, and drive them back, or at least bring them to our lines in such condition as to make them an easy prey. There was neither time nor necessity for reporting this

to General Meade, and beginning on the right, I instructed the chiefs of artillery and battery commanders to withhold their fire for fifteen or twenty minutes after the cannonade commenced, then to concentrate their fire with all possible accuracy on those batteries which were most destructive to us—but slowly, so that when the enemy's ammunition was exhausted, we should have sufficient left to meet the assault. I had just given these orders to the last battery on Little Round Top, when the signal gun was fired, and the enemy opened with all his guns. From that point the scene was indescribably grand. All their batteries were soon covered with smoke, through which the flashes were incessant, whilst the air seemed filled with shells, whose sharp explosions, with the hurtling of their fragments, formed a running accompaniment to the deep roar of the guns. Thence I rode to the Artillery Reserve to order fresh batteries and ammunition to be sent up to the ridge so soon as the cannonade ceased; but both the reserve and the train were gone to a safer place. Messengers, however, had been left to receive and convey orders, which I sent by them, and then returned to the ridge. Turning into the Taneytown pike, I saw evidence of the necessity under which the reserve had “decamped,” in the remains of a dozen exploded caissons, which had been placed under cover of a hill, but which the shells had managed to search out. In fact, the fire was more dangerous behind the ridge than on its crest, which I soon reached at the position occupied by General Newton behind McGilvery's batteries, from which we had a fine view, as all our own guns were now in action.

Most of the enemy's projectiles passed over—

SLOCUM'S HEADQUARTERS, POWER'S HILL.

head, the effect being to sweep all the open ground in our rear, which was of little benefit to the Confederates—a mere waste of ammunition, for everything here could seek shelter. And just here an incident already published may be repeated, as it illustrates a peculiar feature of civil war. Colonel Long, who was

at the time on General Lee's staff, had a few years before served in my mounted battery expressly to receive a course of instruction in the use of field artillery. At Appomattox we spent several hours together, and in the course of conversation I told him I was not satisfied with the conduct of this cannonade

PICKETT'S CHARGE, I.—THE UNION LINES BETWEEN THE "CLUMP OF TREES" AND THE ROUND TOPS.

(General Hancock and staff are seen in the left center of the picture.— This and the two pictures that follow are from the Cyclorama of Gettysburg, by permission of the National Panorama Company.)

which I had heard was under his direction, inasmuch as he had not done justice to his instruction; that his fire, instead of being concentrated on the point of attack, as it ought to have been, and as I expected it would be, was scattered over the whole field. He was amused at the criticism and said: "I remembered my lessons at the time, and when the fire became so scattered, wondered what you would think about it!"

I now rode along the ridge to inspect the batteries. The infantry were lying down on

its reverse slope, near the crest, in open ranks, waiting events. As I passed along, a bolt from a rifle-gun struck the ground just in front of a man of the front rank, penetrated the surface and passed under him, throwing him "over and over." He fell behind the rear rank, apparently dead, and a ridge of earth where he had been lying reminded me of the backwoods practice of "barking" squirrels. Our fire was deliberate, but on inspecting the chests I found that the ammunition was running low, and hastened to General Meade to

"Clump of Trees."

Codori's.

In this hand-to-hand conflict General Armistead was killed and General Webb was wounded.

advise its immediate cessation and preparation for the assault which would certainly follow. The headquarters building, immediately behind the ridge, had been abandoned, and many of the horses of the staff lay dead. Being told that the general had gone to the cemetery, I proceeded thither. He was not there, and on telling General Howard my object, he concurred in its propriety, and I rode back along the ridge, ordering the fire to cease. This was followed by a cessation of that of the enemy, under the mistaken impression that he had silenced our guns, and almost immediately his infantry came out of the woods and formed for the assault. On my way to the Taneytown road to meet the fresh batteries I had ordered up, I met Major Bingham, of Hancock's staff, who informed me that General Meade's aids were seeking me with orders to "cease firing"; so I had only anticipated his wishes. The batteries were found and brought up, and Fitzhugh's, Cowan's, and Parsons's put in near the clump of trees. Meantime the enemy advanced, and McGilvery opened an oblique destructive fire, reënforced by that of Rittenhouse's six rifle-guns from Round Top, which were served with remarkable accuracy, enfilading Pickett's lines. The Confederate approach was magnificent, and excited our

admiration; but the story of that charge is so well known that I need not dwell upon it, further than concerns my own command. The steady fire from McGilvery and Rittenhouse, on their right, caused Pickett's men to "drift" in the opposite direction, so that the weight of the assault fell upon the positions occupied by Hazard's batteries. I had counted

PICKETT'S CHARGE, III.—UNION TROOPS ADVANCING UPON PICKETT'S LEFT FLANK. (FROM THE GETTYSBURG CYCLORAMA.)

on an artillery cross-fire that would stop it before it reached our lines, but, except a few shots here and there, Hazard's batteries were silent until the enemy came within canister range. They had, unfortunately, exhausted their long-range projectiles during the cannonade, under the orders of their corps-commander, and it was too late to replace them. Had my instructions been followed here, as they were by McGilvery, I do not believe that Pickett's division would have reached our line. We lost not only the fire of one-third of our guns, but the resulting cross-fire which would have doubled its value. The prime fault was in the obscurity of our army regulations as to the artillery, and the absence of all regulations as to the proper relations of the different arms of service to each other. On this occasion it cost us much blood, many lives, and for a moment endangered the success of the battle. Soon after Pickett's repulse, Wilcox's, Wright's, and Perry's brigades were moved forward, but under the fire of the batteries in Gibbon's front and the fire of McGilvery's and Rittenhouse's guns, they soon fell back. The losses in the batteries of the Second Corps were very heavy. Rorty and Cushing were killed and Woodruff mortally wounded at their guns. So great was the destruction of men and horses, that Cushing's and Woodruff's United States and Brown's and Arnold's Rhode Island batteries were consolidated to form two serviceable ones.

VOL. XXXIII.—61.

The advance of the Confederate brigades to cover Pickett's retreat showed that the enemy's line opposite Cemetery Ridge was occupied by infantry, our own line on the ridge was in more or less disorder as the result of the conflict, and in no condition to advance a sufficient force for a counter assault. The largest bodies of organized troops available were on the left and General Meade now

proceeded to Round Top and pushed out skirmishers to feel the enemy in its front. An advance to the Plum Run line of the troops behind it would have brought them directly in front of the numerous batteries which crowned the Emmettsburg Ridge, commanding that line and all the intervening ground; a further advance, to the attack, would have brought them under additional heavy flank fires. McCandless's brigade, supported by Nevin's, was, however, pushed forward, under cover of the woods, which protected them from the fire of all these batteries; it crossed the Wheat-field, cleared the woods, and had an encounter with a portion of Benning's brigade, which was retiring. Hood's and McLaws's divisions were falling back under Longstreet's orders to their strong position, resting on Peach Orchard and covering Hill's line. It needs but a moment's examination of the official map to see that our troops on the left were locked up. As to the center, Pickett's and Pettigrew's assaulting divisions had formed no part of A. P. Hill's line, which was practically intact. The idea that there must have been "a gap of at least a mile" in that line, made by throwing forward these divisions, and that a prompt advance from Cemetery Ridge would have given us the line itself, or at least the artillery in front of it, was a delusion. A prompt counter-charge after a combat between two small bodies of men is one thing; the change from the defensive to the offensive of an army, after an engagement at a single *point*, is quite another. *This* was not a "Waterloo defeat" with a fresh army to follow it up, and to have made such a change to the offensive, on

the assumption that Lee had made no provision against a reverse, would have been rash in the extreme. An advance of twenty thousand men from Cemetery Ridge in the face of the hundred and forty guns then in position would have been stark madness; an immediate advance from any point, in force, was simply impracticable, and before due preparation could have been made for a change to the offensive, the favorable moment—had any resulted from the repulse—would have passed away.

Whilst the main battle was raging, a sharp cavalry combat took place on our right between Stuart's command of four and Gregg's of three brigades; but Jenkins's Confederate brigade was soon thrown out of action from lack of ammunition, and two only of Gregg's were engaged. Stuart had been ordered to cover

Ewell's left and was proceeding towards the Baltimore pike, where he hoped to create a diversion in aid of the Confederate infantry, and in case of Pickett's success to fall upon the retreating Federal troops. From near Cress's Ridge, two and a half miles east of Gettysburg, Stuart commanded a view of the roads

enforcements, and Gregg, then near the Baltimore pike, brought him Custer's brigade and Pennington's and Randol's batteries. The artillery soon drove the Confederates out of Rummel's, and Griffin's Confederate battery from its position. Both sides brought up reinforcements and the battle swayed from side to side of the interval. Finally the Federals were pressed back, and Lee and Hampton, emerging from the wood, charged, sword in hand, through a destructive artillery fire, for the falling back of the Federals had uncovered their batteries. They were met by Custer's and such other mounted squadrons as could be thrown in; a *mêlée* ensued, in which Hampton was se-

in rear of the Federal lines. On its northern wooded end he posted Griffin's battery, and took possession of the Rummel farm buildings, a few hundred yards distant. Hampton and Fitzhugh Lee were on his left, covered by the wood, Jenkins and Chambliss on the right, along the ridge. Half a mile east on a low parallel ridge, the southern part of which bending west towards Cress's Ridge furnished excellent positions for artillery, was the Federal brigade of McIntosh, who now sent a force towards Rummel's, from which a strong body of skirmishers was thrown to meet them, and the battery opened. McIntosh now demanded re-

BATTLE BETWEEN THE UNION CAVALRY UNDER GREGG AND THE CONFEDERATE CAVALRY UNDER STUART.
(BY A. R. WAUD, AFTER HIS SKETCH MADE AT THE TIME.)

verely wounded and the charge repulsed. Breathed's and McGregor's Confederate batteries had replaced Griffin's, a sharp artillery duel took place, and at nightfall each side held substantially its original ground. Both sides claim to have held the Rummel house. The advantage was decidedly with the Federals, who had foiled Stuart's plans. Thus the battle of Gettysburg closed as it had opened, with a very creditable cavalry operation.

General Lee now abandoned the attempt to dislodge Meade; intrenched a line from Oak Hill to Peach Orchard; started all his *impedimenta* to the Potomac in advance, and followed with his army on the night of July 4, *via* Fairfield. This compelled Meade to take the circuitous routes through the lower passes; and the strategic advantage to Lee and disadvantage to Meade of Gettysburg, were made manifest.

General Meade has been accused of slowness in the pursuit. The charge is not well founded; he lost no time in commencing nor vigor in pushing it. On the morning of the 4th he ordered French at Frederick to seize and hold the lower passes, and put all the cavalry except Gregg's and McIntosh's brigades in motion to harass the enemy's anticipated retreat, and to destroy his trains and bridges at Williamsport. It stormed heavily that day, and the care of the wounded and burial of the dead proceeded, whilst the enemy's line was being reconnoitered. So soon, on the 5th, as it was certain that Lee was retreating, Gregg was started in pursuit on the Chambersburg

pike, and the infantry—now reduced to a little over forty-seven thousand effectives, short of ammunition and supplies—by the lower passes. The Sixth Corps taking the Hagerstown road, Sedgwick reported the Fairfield pass fortified, a large force present, and that a fight could be had; upon which, on the 6th, Meade halted the rest of the infantry and ordered two corps to his support, but soon learning that although the pass could be carried it would cause too much delay, he resumed the march, leaving McIntosh and a brigade of the Sixth Corps to follow the enemy through the Fairfield pass. On the evening of the 4th Kilpatrick had a sharp encounter with the enemy in Monterey pass, and this was followed by daily cavalry combats on the different routes, in which much damage was done to trains and many captures of wagons, caissons, and prisoners effected. On the 5th French destroyed the pontoon bridge at Falling Waters. On the 6th Buford attacked at Williamsport and Kilpatrick toward Hagerstown, on his right, but as Imboden's train guard was strong, Stuart was up, and Longstreet close by, they had to withdraw. The enemy proceeded to construct a new bridge, and intrench a strong line covering Williamsport and Falling Waters. There were heavy rains on the 7th and 8th, but the infantry corps reached Middletown on the morning of the 9th, received supplies, crossed the mountains that day, and at its close the right was at Boonsboro', and the left at Rohrsersville, on the roads to Hagerstown and Williamsport. The river was now greatly swollen

MAJOR-GENERAL GEORGE E. PICKETT. (FROM A PHOTOGRAPH BY COOK.)

and unfordable, and Halleck on the 10th advised Meade to postpone a general battle until his army was concentrated and his reinforcements up; but Meade, fully alive to the importance of striking Lee before he could cross the Potomac, advanced on that day and the 11th; and on the 12th pushed forward reconnoissances to feel the enemy. After a partial examination, made by himself and his chiefs of staff and of engineers, which showed that its flanks could not be turned, and that the line, so far as seen by them, presented no vulnerable points, he determined to make a demonstration in force on the next morning, the 13th, supported by the whole army, and to attack if a prospect of success offered. On assembling his corps-commanders, however, he found their opinion so adverse that he postponed it for further examination, after which he issued the order for the next day, the 14th. On advancing that morning, it was found that the enemy had abandoned his line and crossed the river, partly by fording, partly by a new bridge.

A careful survey of the enemy's intrenched line after it was abandoned justified the opinion of the corps-commanders against an attack, as it showed that an assault would have been disastrous to us. It proved also that Meade in overriding that opinion did not shrink from

a great responsibility, notwithstanding his own recent experience at Gettysburg, where all the enemy's attacks on even partially intrenched lines had failed. If he erred on this occasion it was on the side of temerity.

But the hopes and expectations excited by the victory of Gettysburg were as unreasonable as the fears that had preceded it; and great was the disappointment that followed the "escape" of Lee's army. It was promptly manifested, too, and in a manner which indicates how harshly and unjustly the Army of the Potomac and its commanders were usually judged and treated; and what trials the latter had to undergo whilst subjected to the meddling and hectoring of a distant superior, himself but too often the mere mouthpiece of an irresponsible clique and from which they were not freed until the general-in-chief accompanied it in the field. That same day, before it was possible that all the circumstances could be known, three telegraphic despatches passed between the respective headquarters.

First. Halleck to Meade:

"I need hardly say to you that the escape of Lee's army without another battle has created great dissatisfaction in the mind of the President, and it will require an active and energetic pursuit on your part to remove the impression that it has not been sufficiently active heretofore."

Second. Meade to Halleck :

"Having performed my duty conscientiously and to the best of my ability, the censure of the President (conveyed in your dispatch of one P. M. this day) is in my judgment so undeserved, that I feel compelled most respectfully to ask to be immediately relieved from the command of this army."

Third. Halleck to Meade :

"July 14th my telegram stating the disappointment of the President at the escape of Lee's army was not intended as a censure, but as a stimulus to an active pursuit. It is not deemed a sufficient cause for your application to be relieved."

The losses of both armies were very large. The revised returns show for the Army of the Potomac: killed, 3063; wounded, 14,492; missing, 5435,—total, 22,990; and for the Army of Northern Virginia: killed, 2592; wounded, 12,706; missing, 5150,—total, 20,448. But the returns for the latter army are not complete; some commands are not reported, and in others the regimental show larger losses than do the brigade returns from which the foregoing numbers are compiled.

As to the comparative strength of the two armies on the field of battle, we have no satisfactory data. The last Confederate return was for May 31st, showing "Present for duty, under arms," 59,484, infantry. The morning report of the Army of the Potomac for June 30th shows "Present for duty, equipped," 77,208, infantry. Neither return is worth much except as a basis for guessing; the long marches, followed by the forced ones of July 1-2, of the Army of the Potomac, left thousands of stragglers on the roads. These totals are of little importance; they would have been of some significance had the larger army been defeated; but it was not. At the "points of contact" the Confederates were almost always

the stronger. On July 1st, eighteen thousand Federal combatants contended against at least twenty-five thousand Confederates, and got the worst of it. On July 2d, Longstreet's fifteen thousand overcame Sickles's ten thousand, and had to halt when a larger force was opposed to them. Williams's Twelfth Corps retook its works from a larger body of Ewell's troops, as at the contested point they were opposed by an inferior number; and then held them, for Johnson's superior force was as much hampered here by the nature of the ground as was Meade's on the left, the evening before. In many respects the Confederates had the advantage: they had much better ground for their artillery; they were fresher; they were all veterans; they were better organized; they were commanded by officers selected for their experience and abilities, and in whom they had implicit confidence. These were enormous advantages, sufficient to counterbalance the difference of numbers; and whilst all the Confederate army, except here and there a brigade, were fought to the utmost, the strongest Federal corps (the Sixth) was hardly in action, the total loss of its eight brigades being but two hundred and forty-two killed, wounded, and missing. But the Southerners were subjected here to the disadvantages that the Northerners had to contend with in Virginia; they were surrounded by enemies, not friends who supplied them with aid and information; and they were not by choice, but necessity, the assailants on the chosen ground of their opponents.

Right gallantly did they act their part, and their failure carried no discredit with it. Their military honor was not tarnished by their defeat, nor their spirit lowered, but their respect for their opponents was restored to what it had been before Fredericksburg and Chancellorsville.

Henry J. Hunt.

CONSECRATION OF THE GETTYSBURG CEMETERY, NOVEMBER 19TH, 1864—THE GATHERING THAT PRESIDENT LINCOLN ADDRESSED. (FROM A PHOTOGRAPH.)

CHARGE OF
ALEXANDER'S ARTILLERY.
(SEE PAGE 466.)

PICKETT'S CHARGE,

AND ARTILLERY FIGHTING AT GETTYSBURG.

THE Reserve Artillery of Longstreet's corps, in the Gettysburg campaign, consisted of the Washington Artillery of New Orleans, then under Major Eshleman, nine guns, and my own battalion of twenty-six guns. Beside these, the artillery of the corps comprised Cabell's, Henry's, and Dearing's battalions of eighteen guns each. The latter battalions were usually attached, on the march, respectively to McLaws's, Hood's, and Pickett's divisions of infantry.

On the first of July, 1863, the Reserve Artillery was encamped near Greenwood, and had no idea that the great battle of the campaign had already opened about eighteen miles away. Early in the night, however, rumors reached us that Hill's corps had been heavily engaged, and that Ewell's had come to his assistance; that the enemy had been driven some distance, but had finally made a stand in a very strong position. These rumors were soon followed by orders for the artillery to march at one o'clock for the front. There was little time for sleep before taking the road, and I think but few improved even that little. There was the usual lively interest, of course, to hear of the personal fortunes of friends in the two corps which had been engaged. Who was killed and who safe? Then there was no one so dull as not to appreciate the tremendous gravity to us of the results of the battle which the next day was to bring. We had penetrated farther into the enemy's country than ever before. Our only communication with our arsenals and depots was by an unguarded wagon-road to Staunton, Virginia, about two hundred miles, over mountains and across unbridged rivers; much of it through a hostile country, and all of it liable to cavalry raids by

the enemy. But we felt that we were now, somehow, nearer the enemy's heart than we had ever been before,—within easier reach of some vital part,—and that a blow struck now must have many times the effect it would have if given in Virginia against only an invading army. Our confidence in our commander was, of course, supreme, and the opportune arrival of Ewell to Hill's aid gave fresh confirmation of the skill that would direct our efforts. There seemed to be a sort of feeling that everything favored us and that victory or defeat now depended solely on ourselves.

Except in equipment, I don't think a better army, better nerved up to its work, ever marched upon a battle-field. But many of our infantry still carried smooth-bore muskets, and our artillery ammunition was inferior, especially that of the rifles. The Confederacy did not have the facilities for much nice work of that sort, and we had to take what we could get without rigid inspection. How our rifled batteries always envied our friends in the opposition their abundant supply of splendid ammunition! For an unreliable fuse or a rifle-shell which "tumbles" sickens, not only the gunner, but the whole battery, more than "misfires" at large game dishearten a sportsman. There is no encouragement to careful aiming when the ammunition fails, and the men feel handicapped. But for all our confidence that Providence had now at last consented to "come down and take a proper view of the situation," as one of our good chaplains used to pray, there was a very natural anxiety to know how the enemy had fought the day before. As we met the wounded and staff-officers who had been in the action, I remember many questions asked on that

subject. There was no great comfort to be derived from the answers, which were generally in profane simile. Indeed, I have heard survivors of the war say since that some of the Federal fighting that day equaled or surpassed any they ever saw from first to last.

We marched quite steadily, with a good road and a bright moon, until about seven A. M. on the 2d, when we halted in a grassy open grove about a mile short of Seminary Ridge, and fed and watered. Here, while eating a cold breakfast, I was sent for by General Longstreet, and, riding forward, found him with General Lee on Seminary Ridge. Opposite, about a mile away, on Cemetery Ridge, overlooking the town, lay the enemy, their batteries making considerable display, but their infantry, behind stone walls and ridges, scarcely visible. In between were only gentle rolling slopes of pasture and wheat fields, with a considerable body of woods to the right and front. The two Round Tops looked over everything, and a signal-flag was visible on the highest. Instinctively the idea arose, "If we could only take position here and have them attack us through this open ground!" But I soon learned that we were in no such luck—the boot, in fact, being upon the other foot.

It was explained to me that our corps was to assault the enemy's left flank, and I was directed to reconnoiter it and then to take charge of all the artillery of the corps and direct it in the attack, leaving my own battalion to the command of Major Huger. I was particularly cautioned, in moving the artillery, to keep it out of sight of the signal-station upon Round Top.*

I immediately started on my reconnoissance, and in about three hours had a good idea of all the ground, and had Cabell's, Henry's, and my own battalions parked near where our infantry lines were to be formed and the attack begun. Dearing's battalion with Pickett's infantry was not yet up, and the Washington Artillery was left in reserve.

Through some blunder, part of our infantry had been marched on a road that brought them in sight of Round Top, and instead of taking to the fields and hollows, they had been

* This suggests the remark that I have never understood why the enemy abandoned the use of military balloons early in 1863, after having used them extensively up to that time. Even if the observers never saw anything, they would have been worth all they cost for the annoyance and delays they caused us in trying to keep our movements out of their sight. That wretched little signal-station upon Round Top that day caused one of our divisions to lose over two hours, and probably delayed our assault nearly that long. During that time a Federal corps arrived near Round Top and became an important factor in the action which followed.—E. P. A.

halted for an hour, and then countermarched and sent around by a circuitous road, via Black Horse Tavern, about five miles out of the way.

We waited quite a time for the infantry, and I think it was about four o'clock when at last the word was given for Hood's division to move out and endeavor to turn the enemy's left, while McLaws awaited the development of Hood's attack, ready to assault the Peach Orchard. Henry's battalion moved out with Hood and was speedily and heavily engaged; Cabell was ready to support him, and at once went into action near Snyder's house, about seven hundred yards from the Peach Orchard.

The Federal artillery was ready for us and in their usual full force and good practice. The ground at Cabell's position gave little protection, and he suffered rapidly in both men and horses. To help him I ran up Huger with eighteen guns of my own twenty-six, to Warfield's house, within five hundred yards of the Peach Orchard, and opened upon it. This made fifty-four guns in action and I hoped they would crush that part of the enemy's line in a very short time, but the fight was longer and hotter than I expected. Two of my guns were fairly dismantled, so accurate was the enemy's fire, and the loss of men was so great that I had to ask General Barksdale, whose brigade was lying down close behind in the wood, for help to handle the heavy twenty-four-pounder howitzers of Moody's battery. He

PROFILE OF CEMETERY RIDGE AS SEEN FROM PICKETT'S POSITION BEFORE THE CHARGE. (FROM A SKETCH BY C. W. REED.)

gave me permission to call for volunteers, and in a minute I had eight good fellows, of whom, alas! we buried two that night and sent to the hospital three others mortally or severely wounded. At last I sent for my other two batteries, but before they arrived McLaws's division charged past our guns, and the enemy

strong position extending along the ridge north of Round Top. Hood's troops under Law gained the slope of Little Round Top, but were driven back to its base. Our infantry lines had become disjointed in the advance and the fighting became a number of isolated combats between brigades. The ar-

tillery took part wherever it could, firing at everything in sight, and a sort of pell-mell fighting lasted until darkness covered the field and the fuses of the flying shells looked like little meteors in the air. But then both musketry and artillery slackened off, and by nine o'clock the field was silent. It was evident that we had not fin-

MENCHIEY'S SPRING, BETWEEN CULP'S HILL AND THE CEMETERY GATE.
(BOTH DRAWINGS ARE AFTER SKETCHES BY C. W. REED.)

deserted their line in confusion. Then I believed that Providence was indeed "taking the proper view," and that the war was very nearly over. Every battery was promptly limbered to the front, and the two batteries from the rear coming up, all six charged in line across the plain and went into action again at the position the enemy had deserted.

I can recall no more splendid sight, on a small scale, and certainly no more inspiring moment during the war, than that of the charge of these six batteries. An artilleryman's heaven is, after a tough resistance, to follow the routed enemy, and throw shells and canister into his disorganized and fleeing masses. Then the explosions of the guns sound louder and more powerful, and the very shouts of the gunners, ordering "Fire!" in rapid succession, thrill one's very soul. There is no excitement on earth like it. It is far prettier shooting than at a compact, narrow line of battle, or at another battery. Now we saw our heaven just in front, and were already breathing the very air of victory. Now we would have our revenge, and make them sorry they had stayed so long. Everything was in a rush. The ground was generally good, and pieces and caissons went at a gallop, some cannoneers mounted, and some running by the sides—not in regular line, but a general race and scramble to get there first.

But we only had a moderately good time with Sickles's retreating corps after all. They fell back upon fresh troops in what seemed a

SPANGLER'S SPRING, EAST OF CULP'S HILL.

ished the job, and would have to make a fresh effort in the morning. The firing had hardly ceased when my faithful little darky, Charlie, came up hunting for me, with a fresh horse, affectionate congratulations on my safety, and, what was equally acceptable, something to eat. Negro servants hunting for their masters were a feature of the landscape that night. I then found General Longstreet, learned what I could of the fortunes of the day on other parts of the field, and got orders for the morning. They were, in brief, that our present position was to be held and the attack renewed as soon as Pickett arrived, and he was expected early.

There was a great deal to do meanwhile. Horses were to be fed and watered, those killed and disabled replaced from the wagons, ammunition replenished, and the ground ex-

amined and positions of batteries rectified. But a splendid moon made all comparatively easy, and greatly assisted, too, in the care of the wounded, many of whom, both our own and the enemy's, lay about among our batteries until the firing ceased. About one o'clock I made a little bed of fence-rails, as preferable to the trampled ground, in the Peach Orchard, and got two hours' sleep. At three, I began to put the batteries into position again and was joined by the Washington Artillery, which had been in reserve the day before. As daylight came, I found I had placed about twenty guns so that the enemy's batteries on Cemetery Hill enfiladed the line, and I had a panic, almost, for fear the enemy would discover the error and open before I could rectify it. They could not, perhaps, see down into the valley as early as I could see them, and all was right before they opened. They never could have resisted the temptation to such a pot-shot. Apparently to feel us, they fired a few shots, and hit one or two men and some horses; but we did not respond, wanting to save our ammunition for the real work, and we were grateful to them for their moderation, our ground being very unfavorable as regarded shelter.

Early in the morning General Lee came round, and I was then told that we were to assault Cemetery Hill, which lay rather to our left. This necessitated a good many changes of position which the enemy did not altogether approve of, and they took occasional shots at us, though we shifted about as inoffensively as possible, and religiously kept from getting into bunches. But we stood it all meekly, and by ten o'clock, Dearing having come up, we had seventy-five guns in what was practically one battery, disposed to fire on Cemetery Hill and the batteries south of it which would have a fire on our advancing infantry. Pickett's division had arrived, and was resting and eating. Along Seminary Ridge, a short distance to our left, were sixty-three guns of A. P. Hill's corps under Colonel R. L. Walker. As their distance was a little too great for effective howitzer fire, General Pendleton offered me the use of nine howitzers belonging to this corps. I accepted them, intending to take them into the charge with Pickett; so I put them in a hollow behind a bit of wood, with no orders but to wait there until I sent for them. About eleven, some of Hill's skirmishers and the enemy's began fighting over a barn between the lines, and gradually his artillery and the enemy's took part, until over a hundred guns were engaged, and a tremendous roar was kept up for quite a time. But it gradually died out, and the whole field became as silent as a churchyard

until one o'clock. The enemy, conscious of the strength of his position, simply sat still and waited for us. It had been arranged that when the infantry column was ready, General Longstreet should order two guns fired by the Washington Artillery. On that signal all our guns were to open on Cemetery Hill and the ridge extending toward Round Top, which was covered with batteries. I was to observe the fire and give Pickett the order to charge. I accordingly took position, about twelve, at the most favorable point, just on the left of the line of guns and with one of Pickett's couriers with me. About twelve o'clock I received the following note from General Longstreet: "COLONEL—If the artillery fire does not have the effect to drive off the enemy or greatly demoralize him, so as to make our efforts pretty certain, I would prefer that you should not advise General Pickett to make the charge. I shall rely a great deal on your good judgment to determine the matter, and shall expect you to let General Pickett know when the moment offers."

This note rather startled me. If that assault was to be made on General Lee's judgment, it was all right, but I did not want it made on mine. I wrote back to General Longstreet to the following effect: "GENERAL—I will only be able to judge of the effect of our fire on the enemy by his return fire, for his infantry is but little exposed to view and the smoke will obscure the whole field. If, as I infer from your note, there is any alternative to this attack, it should be carefully considered before opening our fire, for it will take all the artillery ammunition we have left to test this one thoroughly, and, if the result is unfavorable, we will have none left for another effort. And even if this is entirely successful, it can only be so at a very bloody cost."

To this presently came the following reply: "COLONEL—The intention is to advance the infantry if the artillery has the desired effect of driving the enemy's off, or having other effect such as to warrant us in making the attack. When the moment arrives advise General Pickett, and of course advance such artillery as you can use in aiding the attack."

I hardly knew whether this left me discretion or not, but at any rate it was decided that the artillery must open. I felt that if we went that far we could not draw back, but the infantry must go too. General A. R. Wright, of Hill's corps, was with me, looking at the position, when these notes were received, and we discussed them together. Wright said: "It is not so hard to *go there* as it looks; I was nearly there with my brigade yesterday. The trouble is to stay there. The whole Yankee army is there in a bunch."

I was influenced by this, and somewhat by a sort of camp rumor which I had heard that morning, that General Lee had said that he was going to send every man he had upon that hill. At any rate, I assumed that the question of supports had been well considered and that whatever was possible would be done. But before replying I rode to see Pickett, who was with his division a short distance in the rear. I did not tell him my object, but only tried to guess how he felt about the charge. He seemed very sanguine, and thought himself in luck to have the chance. Then I felt that I could not make any delay or let the attack suffer by any indecision on my part. And, that General Longstreet might know my intention, I wrote him only this: "GENERAL—When our artillery fire is at its best, I shall order Pickett to charge."

Then, getting a little more anxious, I decided to send for the nine howitzers and take them ahead of Pickett up nearly to musket range, instead of following close behind him as at first intended; so I sent a courier to bring them up in front of the infantry, but under cover of the wood. The courier could not find them. He was sent again, and only returned after our fire was opened, saying they were gone. I afterwards learned that General Pendleton had sent for a part of them, and the others had moved to a neighboring hollow to get out of the line of the enemy's fire at one of Hill's batteries during the artillery duel they had had an hour before.

At exactly one o'clock by my watch the two signal-guns were heard in quick succession. In another minute every gun was at work. The enemy were not slow in coming back at us, and the grand roar of nearly the whole artillery of both armies burst in on the silence, almost as suddenly as the full notes of an organ could fill a church.

The artillery of Ewell's corps, however, took only a small part, I believe, in this, as they were too far away around the town. Some of them might have done good service from positions between Hill and Ewell, enfilading the batteries fighting us. The opportunity to do that was the single advantage, in our having the exterior line, to compensate for all its disadvantages. But our line was so far extended that all of it was not well studied, and the officers of each corps had no opportunity to examine each other's ground for chances of coöperative work.

The enemy's position seemed to have broken out with guns everywhere, and from Round Top to Cemetery Hill was blazing like a volcano. The air seemed full of missiles from every direction. The severity of the fire may

be illustrated by the casualties in my own battalion under Major Huger.

Under my predecessor, General S. D. Lee, the battalion had made a reputation at the Second Manassas and also at Sharpsburg. At the latter battle it had a peculiarly hard time fighting infantry and superior metal nearly all day, and losing about eighty-five men and sixty horses. Sharpsburg they called "artillery hell." At Gettysburg the losses in the same command, including the infantry that volunteered to help serve the guns, were 144 men and 116 horses, nearly all by artillery fire. Some parts of the Federal artillery suffered in the same proportion under our fire. I heard of one battery losing twenty-seven out of thirty-six horses in ten minutes.

Before the cannonade opened I had made up my mind to give Pickett the order to advance within fifteen or twenty minutes after it began. But when I looked at the full development of the enemy's batteries, and knew that his infantry was generally protected from our fire by stone walls and swells of the ground, I could not bring myself to give the word. It seemed madness to launch infantry into that fire, with nearly three-quarters of a mile to go in the midday July sun. I let the fifteen minutes pass, and twenty, and twenty-five, hoping vainly for something to turn up. Then I wrote to Pickett: "If you are coming at all you must come at once, or I cannot give you proper support; but the enemy's fire has not slackened at all; at least eighteen guns are still firing from the cemetery itself." Five minutes after sending that message, the enemy's fire suddenly began to slacken, and the guns in the cemetery limbered up and vacated the position.

We Confederates often did such things as that to save our ammunition for use against infantry, but I had never before seen the Federals withdraw their guns simply to save them up for the infantry fight. So I said, "If he does not run fresh batteries in there in five minutes, this is our fight." I looked anxiously with my glass, and the five minutes passed without a sign of life on the deserted position, still swept by our fire, and littered with dead men and horses and fragments of disabled carriages. Then I wrote Pickett, urgently: "For God's sake, come quick. The eighteen guns are gone; come quick, or my ammunition won't let me support you properly."

I afterward heard from others what took place with my first note to Pickett.

Pickett took it to Longstreet, Longstreet read it, and said nothing. Pickett said, "General, shall I advance?" Longstreet, knowing it had to be, but unwilling to give the word, turned his face away. Pickett saluted and said, "I am

CEMETERY RIDGE AFTER PICKETT'S CHARGE. (BY EDWIN FORBES, AFTER HIS SKETCH MADE AT THE TIME.)

going to move forward, sir," galloped off to his division and immediately put it in motion.*

Longstreet, leaving his staff, came out alone to where I was. It was then about 1:40 P. M. I explained the situation, feeling then more hopeful, but afraid our artillery ammunition might not hold out for all we would want. Longstreet said, "Stop Pickett immediately and replenish your ammunition." I explained that it would take too long, and the enemy would recover from the effect our fire was then having, and we had, moreover, very little to replenish with. Longstreet said, "I don't want to make this attack. I would stop it now but that General Lee ordered it and expects it to go on. I don't see how it can succeed."

I listened, but did not dare offer a word. The battle was lost if we stopped. Ammunition was far too low to try anything else, for we had been fighting three days. There was a chance, and it was not my part to interfere. While Longstreet was still speaking, Pickett's division swept out of the wood and showed the full length of its gray ranks and shining bayonets, as grand a sight as ever a man looked on. Joining it on the left, Pettigrew stretched farther than I could see. General Dick Garnett, just out of the sick ambulance, and buttoned up in an old blue overcoat, riding at the head of his brigade passed us and saluted Longstreet.

* General Longstreet's version of this scene, which does not differ materially from the above, and his account of the Gettysburg campaign, will appear in a subsequent number of *THE CENTURY*.—EDITOR.

† I remember one with the most horrible wound that I ever saw. We were halted for a moment by a fence, and as the men threw it down for the guns to pass, I

Garnett was a warm personal friend, and we had not met before for months. We had served on the plains together before the war. I rode with him a short distance, and then we wished each other luck and a good-bye which was our last.

Then I rode down the line of guns, selecting such as had enough ammunition to follow Pickett's advance, and starting them after him as fast as possible. I got, I think, fifteen or eighteen in all in a little while, and went with them. Meanwhile, the infantry had no sooner debouched on the plain than all the enemy's line, which had been nearly silent, broke out again with all its batteries. The eighteen guns were back in the cemetery, and a storm of shell began bursting over and among our infantry. All of our guns, silent as the infantry passed between them, reopened when the lines had got a couple of hundred yards away, but the enemy's artillery let us alone and fired only at the infantry. No one could have looked at that advance without feeling proud of it.

But, as our supporting guns advanced, we passed many poor, mangled victims left in its trampled wake.† A terrific infantry fire was now opened upon Pickett, and a considerable force of the enemy moved out to attack the right flank of his line. We halted, unlimbered, and opened fire upon it. Pickett's men never

saw in one of the corners a man sitting down and looking up at me. A solid shot had carried away the whole of both jaws and his tongue. I noticed the powder smut from the shot on the white skin around the wound. He sat up and looked at me steadily, and I looked at him until the guns could pass, but nothing, of course, could be done for him.—E. P. A.

halted, but opened fire at close range, swarmed over the fences and among the enemy's guns, were swallowed up in smoke—and that was the last of them. The conflict hardly seemed to last five minutes before they were melted away, and only disorganized stragglers were coming back, pursued by a moderate fire. Just then, Wilcox's brigade passed by us, moving to Pickett's support. There was no longer anything to support, and with the keenest pity at the useless waste of life, I saw them advance. The men, as they passed us, looked bewildered, as if they wondered what they were expected to do, or why they were there. They were soon, however, halted and moved back. They suffered some losses, and we had a few casualties from canister sent at them at rather long range.

From the position of our guns the sight of this conflict was grand and thrilling, and we watched it as men with a life and death interest in the result. If it were favorable to us, the war was nearly over; if against us, we each had the risks of many battles yet to go through. And the event was culminating with fearful rapidity. Listening to the rolling crashes of musketry, it was hard to realize that they were made up of single reports, and that each musket-shot represented nearly a minute of a man's life in that storm of lead and iron. It seemed as if a hundred thousand men were engaged, and that human life was being poured out like water. As soon as it appeared that the assault had failed we ceased firing, to save ammunition in case the enemy should advance. But we held our ground to look as bold as possible, though entirely without support, and very low in ammunition. The enemy gave us an occasional shot for a while and then, to our great relief, let us rest. About that time General Lee, entirely alone, rode up, and remained with me for a long time. He then probably first appreciated the full extent of the disaster as the disorganized stragglers made their way back past us. The Comte de Paris, in his excellent account of this battle, remarks that Lee, as a soldier, must at this moment have foreseen Appomattox—that he must have realized that he could never again muster so powerful an army, and that for the future he could only delay, but not avert, the failure of his cause. However this may be, it was certainly a momentous thing to him to see that superb attack end in such a bloody repulse. But whatever his emotions, there was no trace of them in his calm and self-possessed bearing. I thought at the time his coming there very imprudent, and the absence of all his staff-officers and couriers strange. It could only have happened by his express intention. I have since thought it possible that he came,

thinking the enemy might follow in pursuit of Pickett, to personally rally stragglers about our guns and make a desperate defense. He had the instincts of a soldier within him as strongly as any man. Looking at Burnside's dense columns swarming through the fire of our guns toward Marye's Hill at Fredericksburg, he had said: "It is well war is so terrible or we would grow too fond of it." No soldier could have looked on at Pickett's charge and not burned to be in it. To have a personal part in a close and desperate fight at that moment would, I believe, have been at heart a great pleasure to General Lee, and possibly he was looking for one. We were here joined by Colonel Fremantle of her Majesty's Coldstream Guards, who was visiting our army. He afterwards published an excellent account of the battle in *Blackwood*, and described many little incidents that took place here, such as General Lee's encouraging the retreating stragglers to rally as soon as they got back to cover, and saying that the failure was his fault, not theirs. Colonel Fremantle especially noticed that General Lee reproved an officer for spurring a foolish horse, and advised him to use only gentle measures. The officer was Lieutenant F. M. Colston of my staff, whom General Lee had requested to ride off to the right, and try to discover the cause of a great cheering we heard in the enemy's lines. We thought it might mean an advance upon us; but it proved to be only a greeting to some general officer riding along the line.

That was the end of the battle. Little by little we got some guns to the rear to replenish and refit, and get in condition to fight again, and some we held boldly in advanced positions all along the line. Sharpshooters came out and worried some of them, and single guns would fire on these, sometimes very rapidly, and managed to keep them back: some parts of the line had not even a picket in front. But the enemy's artillery generally let us alone, and I certainly saw no reason to disturb the *entente cordiale*. Night came very slowly but came at last; and about ten the last gun was withdrawn to Willoughby Run, whence we had moved to the attack the afternoon before.

Of Pickett's three brigadiers, Garnett and Armistead were killed and Kemper dangerously wounded. Fry, who commanded Pettigrew's brigade, which in the charge was the brigade of direction for the whole force and adjoined Garnett on the left, was also left on the field desperately wounded. Of all Pickett's field-officers in the three brigades only one major came out unhurt. The men who made the attack were good enough. The only trouble was there were not enough of them.

Next day, July 4th, we took a pretty fair

position, except that it had no right flank, and awaited the attack of the enemy, who we thought would be inspired by the day. Meanwhile the wounded and trains were started back to the Potomac, and at night, in a pouring rain and over roads that were almost gulfs of mud, the army followed. Providence had evidently not yet taken a "proper view of the situation." We had not finished the war, but had to go back to Virginia and start afresh. Yet the *morale* of the army seemed not at all affected. The defeat was attributed entirely to the position, and if anything it rather gave the men confidence in what position could do for them if they had it on their side. Had Meade attacked us at Downsville, where we were stopped for several days by high water in the Potomac, I believe we should have repulsed him easily, barring exhaustion of ammunition.

The retreat was a terrible march for the artillery, crippled as we were by the loss of so many horses in battle, and the giving out of many more on the stony roads for the lack of horse-shoes. We were compelled to trespass on the reluctant hospitality of the neighboring farmers, and send squads in every direction to get horses. Wherever found they were to be bought, whether the owner desired to sell or not. Of course our only money was Confederate bills, but we explained to the farmers that these would be as good as greenbacks if only they would make their own government stop fighting us. Such transactions we called "pressing" for short; and, by the way, we often practiced it at home as well as abroad, but our own people took it more complacently than did the Dutch farmers of Pennsylvania.

Near Hagerstown I had an experience with an old Dunkard which gave me a high and lasting respect for the people of that faith. My scouts had had a horse transaction with this old gentleman, and he came to see me about it. He made no complaint, but said it was his only horse, and as the scouts had told him we had some hoof-sore horses we should have to leave behind, he came to ask if I would trade him one of those for his horse, as without one his crop would be lost.

I recognized the old man at once as a born gentleman in his delicately speaking of the transaction as a trade. Desiring him to know that one gentleman, even in difficulties, can

always appreciate another, I was earnestly anxious to make it as square as circumstances would permit. So I assented to his taking a foot-sore horse, and offered him beside payment in Confederate money. This he respectfully but firmly declined. Considering how the recent battle had gone, I waived argument but tried another suggestion. I told him that we were in Maryland as the guests of the United States; that after our departure the Government would pay all bills that we left behind, and that I would give him an order on the United States for the value of his horse and have it approved by General Longstreet. To my surprise he declined this also. I supposed then that he was simply ignorant of the bonanza in a claim against the Government, and I explained that; and, telling him that money was no object to us under the circumstances, I offered to include the value of his whole farm. He again said he wanted nothing but the foot-sore horse. Still anxious that the war should not grind this poor old fellow in his poverty, I suggested that he take two or three foot-sore horses which we would have to leave anyhow when we marched. Then he said, "Well, sir, I am a Dunkard, and the rule of our church is an eye for an eye, and a tooth for a tooth, and a horse for a horse, and I can't break the rule."

I replied that the Lord, who made all horses, knew that a good horse was worth a dozen old battery scrubs; and after some time prevailed on him to take two, by calling one of them a gift. But that night about midnight, we were awakened by approaching hoofs and turned out expecting to receive some order. It was my old Dunkard leading one of his foot-sores. "Well, sir," he said, "you made it look all right to me to-day when you were talking; but after I went to bed to-night I got to thinking it all over, and I don't think I can explain it to the church, and I would rather not try." With that he tied old foot-sore to a fence, and rode off abruptly. Even at this late day it is a relief to my conscience to tender to his sect this recognition of their integrity and honesty in lieu of the extra horse which I vainly endeavored to throw into the trade. Their virtues should commend them to all financial institutions in search of incorruptible employees.

E. P. Alexander.

MEMORANDA ON THE CIVIL WAR.

In Reply to General Pleasonton.

REGARDING the account given by General Pleasonton of the affair at Hazel Grove, near Chancellorsville, in the September number of *THE CENTURY*, I beg to say that the following facts can be established

beyond dispute, by the testimony of numerous and unimpeachable eye-witnesses:

1. That no order was given by General Pleasonton to Major Keenan of the Eighth Pennsylvania Cavalry to charge into the woods bordering Hazel Grove, for the purpose of holding the enemy in check until General

Pleasanton could get some guns into position; and that no such charge was made.

2. That the Eighth Pennsylvania was sent by General Pleasanton to report to General Howard at or near Wilderness Church, and had left Hazel Grove for that purpose before the enemy seriously threatened that position.

3. That the gallant charge of the Eighth Pennsylvania was made by order of its commanding officer, Major Pen-nock Huey, on the Plank road, far out of sight and hearing of Hazel Grove, and neither had, nor was intended to have, any bearing on the defense of that position.

4. That the fact that any charge had been made by the Eighth Pennsylvania was unknown to General Pleasanton until Major Huey reported to him the next morning.

5. That when Jackson's advance struck the Eleventh Corps, four batteries had been for some time waiting orders in the extensive clearing known as Hazel Grove. Of these, "H," First Ohio Light Artillery, and the Tenth and Eleventh New York Independent Batteries, belonged to Whipple's division of the Third Corps. They were left there when that division passed through *en route* to join the force operating under General Sickles near the Furnace. Later, Martin's Horse Battery, with Devin's Cavalry Brigade, arrived and took ground on the opposite or south side of the field. When the sound of battle indicated that the enemy were driving in the right of the army, and were approaching Hazel Grove, the batteries of Whipple's division were brought into position under my direction, as acting Chief of Artillery. Although the movement was delayed by causes beyond my control until its execution had become exceedingly difficult, our eighteen guns were established in battery, ready to open, before the enemy fired a shot or were in a position to do so. General Pleasanton seems to be unaware of that fact, or he would hardly have failed to allude to it. It is therefore fair to presume that his attention was engrossed by the supervision of Martin's battery, as detailed in his paper. General Sickles was more observing. On his arrival, soon after the firing ceased, he sent for me, and warmly expressed his approbation of the manner in which my command had held the ground.

6. That nothing on wheels from the Eleventh Corps passed through Hazel Grove, which was entirely out of their line of retreat. The vehicles that stampeded through my lines while in process of formation were forges, battery wagons, ambulances, etc., belonging to the Third Corps, left in the cross-road leading to the Plank road, when that corps went out to the Furnace to attack Jackson's column. So whatever else may have formed the components of the remarkable *tumulus* described by General Pleasanton, it certainly did not contain the *débris* of the Eleventh Corps. As for the *tumulus* itself, it escaped my observation when I crossed the bog he refers to on Sunday morning, with my battery, or what there was left of it, at the pressing solicitation of Archer's Confederate Brigade.

BOSTON, October 14, 1886.

James F. Huntington.

"The Reserve at Antietam."

GENERAL FITZ JOHN PORTER writes to say of Colonel Thomas M. Anderson's communication in the September CENTURY under the above caption, that no such note as "Captain Dryer's report" was seen by him,

and that no such discussion as to the opportunity for using the "reserve" took place between him and General McClellan. General Porter shows that nearly all of his Fifth Corps (according to McClellan's report, twelve thousand nine hundred strong), instead of being idle at that critical hour, had been sent to reinforce the right and left wings, leaving of the Fifth Corps to defend the center, a force "not then four thousand strong," according to General Porter's report.—EDITOR.

Citizens of Gettysburg in the Battle.

FOR twenty-three years we have heard it asserted that the people of Gettysburg were lacking in patriotism because they did not spring to arms *en masse*, and assist in repelling the invaders. I am glad to see in your November issue that a correspondent cites young Weakley, in addition to old John Burns, as another who volunteered in the defense of his home during the battle; but he prefaces his article with the old assertion.

The purpose of this communication is to state that, upon the first indication of an invasion of Pennsylvania, the Twenty-sixth Regiment, P. V. M., was organized and mustered into the United States service at Harrisburg, under the command of Colonel W. W. Jennings of that city. Company A of this regiment, to which I had the honor of belonging, was composed partly of students from the Lutheran Theological Seminary of Gettysburg, partly of students from the Pennsylvania College at the same place, and partly of citizens of Gettysburg; one other company came from Hanover, but a few miles distant. *We were the first militia troops to oppose the entrance of the Confederates into the State.*

On June 23d we left Harrisburg for Gettysburg, to be used, I believe, as riflemen amongst the hills near Cashtown. A railroad accident prevented this plan from being carried into effect, and us from reaching Gettysburg, until the 26th, by which time General Early had passed that point. In accordance with orders received from Major Granville O. Haller, in command of the post, we were marched out on the Chambersburg pike at ten A. M., June 26th, for a distance of about three and a half miles, accompanied by Major Robert Bell, who commanded a troop of horse, also raised, I understand, in Gettysburg. Having halted, our colonel, accompanied by Major Bell, rode to the brow of an elevation distant several hundred yards, and there saw General Early's troops advancing in force, but a few minutes distant. This officer, knowing of our presence but anticipating a still larger force, says in his official report: "I sent General Gordon with his brigade and White's battalion of cavalry on the pike through Cashtown towards Gettysburg, and moved with the rest of the command to the left through Hilltown to Mummasburg. . . . The object of this movement was for Gordon to amuse and skirmish with the enemy while I should get on his flank and rear so as to capture his whole force." We, a few hundred men at the most, were in the toils: what should be done? We would gladly have marched to join the Army of the Potomac, under Meade, but where were they? Our colonel, left to his own resources, wisely decided to make an effort to return to Harrisburg, and immediately struck off from the pike, the Confederates capturing many of our rear-guard after a sharp skirmish, and sending their cavalry in pursuit of us. These lat-

ter overtook us in the afternoon at Witmer's house, about four and a half miles from Gettysburg by the Carlisle road, where after an engagement they were repulsed with some loss. I have narrated enough for my purpose, and will only add that, after many vicissitudes, we finally reached Harrisburg, having marched fifty-four out of sixty consecutive hours, with a loss of some two hundred men.

I can recall no instance in our civil war where the people of a town rose in a body, or in any numbers, to aid their troops in driving out the enemy. Now, in view of the fact that Gettysburg, small town as it then was, furnished its quota of brave men who were then in the army serving their several terms of enlistment; and that from it and its immediate vicinity were raised promptly two, if not three, companies of men in defense of their State;

that one of its oldest as well as one of its youngest citizens took up arms for the same purpose and aided in the battle; that hundreds of the unfortunate men of Reynolds's gallant corps were secreted, sheltered, fed, and aided in every way by the men and women of Gettysburg when they were hurled back through its streets, as I know from personal communication with them—I say, in view of these facts, let us give these people the credit that belongs to them instead of casting continued reflections upon their actions. I can the more justly give my opinion in this matter because I was the only member of our company who did not belong to Gettysburg. I went to Harrisburg to be mustered in with the others because my brother, then a student in the Seminary, was amongst them.

READING, PA., Nov. 2, 1886. *H. M. M. Richards.*

GEORGE BANCROFT—IN SOCIETY, IN POLITICS, IN LETTERS.

THE period in the life of our distinguished historian which might stand for a type of his manifold labors and extended activity was that of his mission to Germany. His quiet but elegantly appointed house on the Thiergarten at Berlin was the scene of his most successful diplomatic achievement. It was during his life there that he received the splendid homage of the literary men from all Europe as one of the foremost historians of a time abounding in great historians. It was there that all the threads which connected a fruitful and energetic old age with the education and experience of a restless and fertile youth were finally united to bind the laurels of a great and enduring reputation. And yet as the setting is so important to the picture, it would perhaps distort our view of him as an American, to dwell too long on the rather dazzling splendor of surroundings so aristocratic and foreign. We will like better to think of him in his summer-home as he stands, hat in hand, to welcome the expected visitor under the trees in Newport where the entrance avenue bends toward the great verandas of his large but unostentatious house, which he built there over thirty years ago amid the then quiet beauties of the "Point." As the splendid mansions and somewhat showy gardens have multiplied about him, the friendly screen of his plantations has steadily inclosed him and his favorite roses from the surroundings until the casual visitor, either from the land-side or the wonderful cliff-walk, would pass by ignorant of even the existence of a spot so beautiful in itself and so interesting in its associations. It is even more fitting, however, to recall the American statesman, the American

historian, the laborious and successful representative of the American people in his stately home in Washington. The spacious staircase to the right leads the visitor past the drawing-room and the dining-room upward to the second story, which barely holds the volumes of the great library that lines the walls, fills the entries and passage-ways, and overflows into the window-seats and on to the floors. The busy click of the typewriter gives evidence of the unceasing literary activity of the chief in the labor of his stenographer, and as the door of the great work-room, with its lofty ceilings and open fire-place, is thrown back to receive you, the harmony of these surroundings with the life of the man is evident, even striking.

The figure which rises from behind the work-table, littered with reference-books and manuscripts, is full of dignity and impressiveness. The clear-cut features; the carefully trimmed hair and beard, revealing a massive and shapely head; the finely molded form and active movement, in no way suggest advanced years: even the expression of the eye and the lines of the forehead fail to reveal frailness or extreme old age. As has recently been said of his friend and contemporary Von Ranke, who was only five years his senior, he seems to have outgrown and conquered old age itself, and to have found a substitute for physical force in the continuous energy of faith and love, in an apparently inexhaustible and indomitable intellect. His stature, which is about that of the average man or somewhat less, has lost nothing under the burden of years, and he carries firm and erect the slight but close-knit chest and capacious head with which he has for so long pushed and wrought in the crises and struggles of the great world in which he lives. Nor is there a trace of lassitude in his manners. The same trait which Harriet Martineau noted and

recorded of him and his household fifty years ago in the account of her travels in the United States is still characteristic—that of joyousness. Change and bereavement, toil and anxiety, have in no way diminished or altered the capacity for appreciation of what is best in life and in mankind. The interchange of interest and relation begins at once in his conversation; the present is not overshadowed by the distant past, and it is only some natural reference to a personal experience—it may be a memory of the appearance of Goethe, or the talk of Byron—which suddenly overwhelms the listener in the realization that this is a Nestor. The force of his incessant labor in the noble fields of making and writing history is fitly supplemented by the grandeur inherent in eighty-six years of life—eighty-six years, with all it means at this stage in the world's development! The nineteenth century, from the childhood to the maturity, not of men, but of nations, as the present generation knows them; from absolutism through revolution to democracy in politics; from the classic and romantic in letters to modern realism; from the rude beginnings of chemistry and physics to the overwhelming conquests of the natural sciences in every direction; from the stage-coach and post-boy to the railway and telegraph—Bancroft has surely been favored in the splendor of the times and the achievements of hand and mind of which he has been a part.

The great vitality underlying an activity and perseverance so phenomenal is in no sense accidental. It is in part inherited, in part self-created. The Bancroft family has been for over two centuries and a half in America. It was from the beginning frugal in its living and high in its thinking, as were so many of the families in the early New England communities. Simple lives and pure thoughts are the best architects of health and contentment. The historian's grandsire was one of the leading men in the town of Lynn, then known as Reading. His character was so famous as a man of God that if no clergyman could be secured, he frequently officiated in the services of the Lord's day; and when Jonathan Edwards was hounded to despair by the congregation of Northampton because he wished to prevent the young from reading books which he considered obscene, it was to this elder Bancroft that he turned as his umpire in the reference which settled the dispute and severed his connection with an ungrateful and unappreciative parish. The orthodoxy of the distinguished grandson was drawn from the fountain-head, for his famous father, the Rev. Aaron Bancroft of Worcester, was a Unitarian, and no sympathizer with Calvinism either in religion or in politics. He, too, lived

to be a nonagenarian, and aside from the reputation earned by his long career as a pastor, left a name renowned for honesty of purpose and purity of living, which was linked with some literary fame. He was the author of a "Life of Washington," now unknown, but which was once an authority, and is marked by accuracy of statement and a most agreeable literary quality and style. The inheritance of a wholesome, untainted, vigorous blood which George Bancroft had from his sires was not suffered to lie idle. It was a day of small things in Massachusetts where material indulgences were concerned, and throughout his early life at home in Worcester, his boyhood at Exeter Academy, and his college days at Harvard, he had constant training in the lessons of a wholesome economy, the education of self-restraint, and the triumphs of a laborious and well-directed ambition. The impressions thus gained were no doubt strengthened and confirmed by the experiences of his student life at Göttingen and Berlin, where his intimate association with men like Heeren, Voss, and Blumenbach made him still more familiar with frugal habits, simple tastes, and high scholarship.

STUDIES AT HOME AND ABROAD.

THE preparatory years of Bancroft's career were over at an early age. He graduated from Harvard in the class of 1817, and was only seventeen on the 3d of October in the same year. His school life at Worcester is scarcely worthy of mention, so unsatisfactory was the instruction. His father's home was on a farm a mile and a half from the town in one direction, and Nelson's school, the only one of any repute, at the extreme opposite corner, so that from eight to eleven his daily tasks were begun and ended by a walk of more than two miles. When, at eleven, he left home for Exeter, he found himself, thanks to a friend of his father's who read Cæsar with him, on a level of attainment with his fellows. The principal of the school was that famous Dr. Abbott, who will ever rank as one of the great schoolmasters of America. Suave and earnest, serious but never harsh, solemn but kind, he never failed to command the perfect respect of every school-boy, and Bancroft immediately felt his influence. We are apt to smile at earnestness in a boy of eleven in our days, and as we expect little get little; but the real foundation of Bancroft's classical attainments was made at that age, in his own room, and with only a mediate impulse from class-room work. His other master was Hildreth, father of the historian, a notable teacher, strong and suggestive but at times severe and harsh. With the other masters, Fuller and Ware, he had little intercourse and no tasks, although

he always found a welcome and good wholesome talk in Fuller's room when he cared to visit him in the evening.

It was during the two years of his stay at Exeter that he first met and heard Webster. Nathan Parker, minister at Portsmouth, was a warm personal friend of the Bancrofts. He had read theology with the father and taught the son his letters. Accordingly the school-boy's vacations were naturally spent at his house. The memories of Parker's sweetness and goodness are among the pleasantest of his life. About that time Webster had removed to Portsmouth, and was to deliver the oration on Independence Day. He spoke from the pulpit of the small meeting-house to an audience which barely filled the room. He read his oration earnestly, and without any gesture whatever except that once he placed his right hand over his heart. One of the Exeter masters who sat in the gallery opposite Bancroft pronounced it a "wonderful good oration, which would have received boundless applause in Boston." It was soon after that Webster was elected to Congress.

Bancroft's college career was the determinative period of his life. In his Freshman year Edward Everett was his tutor in Greek, and awakened in him a profound admiration. Later, Everett was made Professor of Greek, and accepted on condition of being permitted to travel and study in preparation for the office. When in Göttingen, he wrote to President Kirkland recommending that a young man of promise be sent out to prepare for the next professorship that might fall vacant "by learning what was to be learned." The choice fell upon Bancroft, and soon after graduation the proposal was made to him, and his father gave his consent. The intellectual direction of Harvard had little influence on the sixteen-year-old boy, although the President was a warm sympathetic friend, exercising a paternal oversight and care in all his work and recreation. The text-book in philosophy was "Locke on the Understanding," and the instruction consisted in assigning so many pages as a lesson and a formal recitation, without regard to logical divisions or anything else except the words of the text. But in his Junior year "Edwards on the Will" fell into his hands. It seems to have had much the same fascination for him that Locke himself is said to have had for Edwards, but with a far different result. Instead of rousing Bancroft to opposition and polemics, Edwards' philosophy fascinated and convinced him, and in the writing and talk of his later life he has often referred to it as his creed. It was, however, essentially the philosophy of Edwards that moved him, for although in

deference to his father's wishes he studied theology for eight months, the profession of the ministry never attracted him, and he was drawn to letters and philosophy from the beginning. Enjoying as he did the society and protection of all that was best in the greatest intellectual center of his time in America, he nevertheless was led in a direction of thought very far from the prevailing one, and the intellectual atmosphere of Boston was almost from the first uncongenial.

It was with only a smattering knowledge of German that he entered upon his university life in Göttingen. It was natural, therefore, that his principal work should have been in German literature, from which he made a number of excellent translations that were afterwards published; in Greek philosophy, for which he had a natural aptitude and a previous training; and above all in the department of history, which, under the masterly guidance of the distinguished Heeren, was easily the foremost and most attractive in the University. Whether fortunately or unfortunately, the critical method in philology had not yet engulfed all others, and the enthusiasm of German students at that day was expended upon the beauties of the style, diction, and material of what they read. With his fellows Bancroft read, therefore, incessantly, both Greek and German, and formed a taste and capacity for wide generalizations. Dissen, the leading Professor of Philosophy, was an ardent Platonist, a famous student and teacher, but he never wrote, and his reputation is forgotten. He heard lectures from Eichhorn on the New Testament, from Blumenbach on natural history, and studied Arabic, Syriac, and Persian. But by far the most influential man of the Faculty was Heeren, who was as well the leading mind of all Europe in historical criticism. There is traceable throughout Bancroft's life, both in his history and his political course, the most marked and decided influence of Heeren, and of the splendid work which set on foot what was neither more nor less than a revolution in historical science.

Like many another ardent beginner, Bancroft went to Germany with the firm conviction that German students worked themselves to death. Perhaps the most valuable of all the lessons he learned was the truth of the exact opposite: the prevalence of moderation among the truly great; the careful intermixture of work and recreation; above all, the hatred and contempt of worry. Eichhorn once said he never knew of a case where death came from overwork, but he did know of many where worry and fretting had resulted in nervous collapse. He told of a poor young man, very anxious to succeed as a professor,

who came to obtain the use of his lecture-room, which was directly under his study. At the appointed hour the lecture began, intense, vehement, oratorical, and continued so to the end. "I called him up," said Eichhorn, "and explained that it would never, never do; that he would worry himself sick, and there would be an end of it all."

After two years in Göttingen, at the end of which he obtained the degree of Doctor of Philosophy by examination and the defense of a thesis, Bancroft moved to Berlin. In Germany the young doctor is "free of the guild," and partly for that reason, no doubt, but especially because of the character of his work, he received a hearty welcome in the splendid literary circle of the Prussian capital. He was constantly in the houses of Savigny and Schleiermacher, being often bidden to the latter two or three times in a single week. He also knew William von Humboldt, F. A. Wolf, and Voss. Wolf once said in Bancroft's hearing that he could read Aristophanes as he could his prayer-book. "Impossible and untrue," said Voss when he heard it. "When I want to find anything in Homer, I first look for it in my own translation. No man can know a foreign language as he does his own." Bancroft was not attracted by Hegel, although he heard what was probably his most brilliant course of lectures, that on *Æsthetics*, in which he strove to find a basis for his system in the History of Philosophy. It seemed to his young hearer that his principal concern was to make the Christian religion go on all-fours with his philosophy, and his delivery was so far from being magnetic that it might almost be characterized as prosy. His philosophic system, moreover, was the talk of but the few in Berlin and never permeated the people, not even the cultivated classes. The lectures of Schleiermacher, on the contrary, were brilliant and attractive. Thoroughly familiar with Plato and the Socratic method, he was a master of dialectic, and was so keen in its exercise that he was rarely known to give any direct reply to questions designed to pin him down to a categorical answer with reference to controverted points in philosophy.

GOETHE, SCHLEIERMACHER, BYRON.

It was during a Göttingen vacation, four years after the battle of Waterloo, that Bancroft met Goethe for the first time at Jena. It was early in the forenoon; Bancroft had an introduction from one of the professors, and Goethe received him in the garden of the great house where the poet was occupying an apartment assigned him by the grand duke. The interview was altogether informal; Goethe's manner

was unstudied and natural, gracious and simple, although he was then over seventy years old. He was clad in the ordinary costume of the time, except that there was no waistcoat under his frock, and the shirt he wore showed by the stains on the ruffle that he had not made his toilet for the day. The conversation was on the topics of the hour in literature and the politics of Germany. On parting he gave Bancroft a letter to the librarian at Weimar with directions to ascertain whether his family could receive the young American. They did so, and entertained him in the kindest manner. A second interview took place at Weimar early in 1821. It was rather in the nature of an audience than like the friendly talk of the previous time. Goethe was carefully dressed, and though kind was rather cold, and preserved an impressive and stately manner. He was full of interest in America and predicted that it would excel in the arts of design, citing as a proof of this latent talent the fashion introduced by American papers of illustrating their advertisements by pictures. He also talked at some length about Byron, and took it for granted that "*Manfred*" was founded on "*Faust*."

On the whole no better picture of Bancroft at the close of his student life could be drawn than that contained in the few lines which Alexander von Humboldt wrote from Paris to introduce him to Pictet at Geneva:

"PARIS, 7 Septembre, 1821.

"Je prends la liberté, mon respectable ami et confrère, de vous recommander un jeune Américain qui a fait d'excellentes études de philologie et d'histoire philosophique en Allemagne. M. Bancroft est bien digne de vous voir de près; il est l'ami de mon frère, et il appartient à cette noble race de jeunes Américains qui trouvent que le vrai bonheur de l'homme consiste dans la culture de l'intelligence.—HUMBOLDT."*

The charge has been more or less frequently brought against him that, after all, he is foreign in his education and feelings, Teutonic in his sympathies as against France and England. The fact is that at no time and under no other circumstances could a young man of his powers have spent three years in Germany with less likelihood of absorbing prejudice or being dazzled. Aside from Heeren's there was little vigorous thought at Göttingen. Religious teaching was at as low an ebb as religious feeling. They had turned, for instance, the University church into a library, and the ministry of education begrudged a new church, so none was built. Heeren himself was a native of Bremen and a republican at heart; he even

* *Le Globe*, Journal Géographique. Organe de la Société de Géographie de Genève pour ses Mémoires et Bulletin. Tome vii. 7^e and 8^e Livraisons. Page 200. Novembre-Décembre, 1868. Genève. Imprimerie Carey Frères, 3 Vieux-College, 1868.

went so far as heartily to support Jefferson's embargo. Wise, good, and discreet, his influence was altogether in the right direction. The University of Berlin, to be sure, had just been started to give character and solidity to the institutions of Prussia; but in calling its professors the only question asked was whether the man was able. Accordingly on the one hand the conservatives, distorting Hegel's theory that the world, as it is, is the result of all the antecedent conditions of existence, declared that therefore the present system was the *ne plus ultra*, the height of perfection. On the other, aided by Schleiermacher, the world of Berlin was kept wide awake with new ideas of philosophy and religion, of the connection between the past and the present. But there was no uniformity or harmony. Bancroft found the famous Sunday evening "at homes" of Schleiermacher occupied with the most varied topics. The great man himself had a nature marked by a cool sort of rationalism. He did not frankly state his opinion. His manner in conversation as in preaching was that of a skillful fencer, adroit in the use of the foil, and was heightened by his small, lithe, and somewhat deformed figure. His acuteness was his most remarkable gift, and when preaching he treated dogma historically, and was neither fervid nor emotionally pious. Faultless in life and conduct, he was not carried away by the idea of benevolence. In short he was a mirror of the thought of his time, at home in any company and on any topic of politics or affairs. With the peculiar attitude of Hegel, and with Schleiermacher denying any originality to his philosophy, there was little in Berlin to turn a well-balanced head. There were great scholars in plenty, but, like Bopp, who spoke English well and fluently and revealed the identity of the grammar of the Indo-European languages, they were content with their specialties and took little interest in political or philosophical tendencies. After leaving Berlin, Bancroft studied history for a time under Von Schlosser at Heidelberg, but was scarcely conscious of his influence.

During the autumn months of 1821 he traveled on foot through Switzerland, and reached Italy in the late vintage time, stopping by the roadside to watch the peasantry treading out the wine-press in their primitive fashion, and washing their empurpled bodies in the running brooks. Then, after a rapid glimpse of Venice and Florence, came Rome. It is not unlikely that the Italian visit, short as it was, influenced in Bancroft the finer side of the mind, the æsthetic faculty and imaginative powers, more deeply than any other period. For three months he was intimate in the families of Niebuhr and Bunsen. In the

case of the latter family the intimacy has continued to children and children's children. It was his habit, as his records show, to extend, during that precious time, each day into two. Rising at dawn, he breakfasted by candlelight and hurried forth in the early morning to the day's task of seeing—churches, galleries, ruins, antiquities, he devoured everything with his eyes, stopping only for a frugal luncheon of a few cakes or a little fruit, and dining at nightfall as his means would allow. Then hurrying to his room he read till the small hours of the morning—all art, history, and the masterpieces of Italian letters, but in particular Dante. Meantime he was forming such a meager collection of art-objects as he could afford, so as to have on his return a material illustration of and a set of mnemonic aids to the work of the great masters, who charmed and elevated his thoughts. Early in the following spring he went on to Naples and Pæstum, returning by the coast to Leghorn. While there the romance of the Mediterranean shore seems to have affected him as it has so many fresh and receptive spirits. Rowing far out to sea, he leaped in and swam toward shore, but escaped the sad fate which befell Shelley only a few weeks later, at Spezzia.

The American squadron was lying at the time in the harbor of Leghorn, and Bancroft was invited by the commodore to meet Byron aboard the flagship. There were present only a few other Americans, among them the consul at Tunis, with his wife and several ladies. When the poet, accompanied by his host and the principal officers of the fleet, came up the companionway, his countenance immediately fell at the sight of the ladies among the new arrivals, thinking probably that they were Englishwomen who had taken advantage of the opportunity to spy him out. But on learning that they were Americans he at once recovered his cheerfulness, and was most approachable. In fact, when the consul's wife laughingly said that her children would want some proof that she had seen Lord Byron, she was permitted to take the rose from his buttonhole. Before leaving, the nobleman's secretary invited Bancroft in his master's name to visit Monte Nero. So intense was the enthusiasm for Byron among the officers of the fleet that when he was rowed ashore one captain manned his yard-arms and fired a salute, but the commodore, feeling that the guest of the day had no position which warranted so official a greeting, allowed it to go no further. Shortly afterward Bancroft wrote a note to ask if he might call at Monte Nero and received a pleasant, lively reply. Byron's reception of his guest was cordial. He was simply but carefully dressed, and during the

breakfast talked of Jeffrey and the bitter attacks of the "Edinburgh Review." His eye was bright and his manner animated, but without bitterness or rancor. He seemed intensely interested in Goethe, and asked many questions about him. The idea that "Manfred" was based on "Faust" he declared to be false, explaining that he had never even seen "Faust." He was evidently delighted to hear how great a favorite he was everywhere in Germany. He spoke also of Thorwaldsen's busts, and said, with seeming dissatisfaction, the last one was too spare. After breakfast he invited Bancroft into the drawing-room, from the windows of which he said Elba was visible, as indeed it was, but very dimly. While they were standing absorbed in trying to discern its outlines, the door opened softly, and a light footstep was heard. It was that of the Countess Guiccioli, and without the slightest embarrassment Byron turned and presented Bancroft to her. She at once made some introductory remark in Italian and talked for some time. The conversation became general, and in the course of it Byron remarked, incidentally, that the Countess did not like the scoffing tone of "Don Juan," and had entreated him not to go on with it, and that he had received letters from others to the same effect. That Bancroft's visit was remembered with pleasure is evident, both from the letters to Murray in which Byron alludes to his young visitor, and from the presentation copy of "Don Juan," with the author's autograph, still in Bancroft's library.

RETURN TO AMERICA.

FROM Leghorn Bancroft traveled to Genoa, and thence on horseback, with a pack-mule to carry the luggage, along the Riviera to Marseilles. The track was often so close to the edge of the sea that the water dashed over his horse's legs. After a short time in Lyons and the south of France he sailed for home. The fairest winds gave a prosperous voyage, Gibraltar was passed at the rate of nine knots against the current, the trade-winds blew in the loveliest weather, the peak of Teneriffe sank out of view, and the apprentice days were over. Surely there could have been no better preparation for the work of life than to have lived with the best men of the age, to have seen, known, and conversed with them on the most vital topics, and yet to have retained, as the sequel showed, independence of thought and the strong home feeling which enables one, when the halcyon days are past, to take up the burden of life with cheerfulness and energy, to seek permanent happiness in work and not in mere change of scene.

On his return to America Bancroft yielded once again to his father's wishes, and was licensed to preach. But his face was set toward pursuits which, though akin to the great profession, are yet aside from it. He felt the few sermons which he preached to be rather exercises in the careful writing of English than a heartfelt message of truth. In this crisis the devoted friendship of President Kirkland came to his assistance, and he accepted almost immediately the position of a teacher of Greek in Harvard College, performing its duties for a year. In 1823 he entered into an agreement with J. G. Cogswell, who was afterward librarian of the Astor Library, and founded the famous Round Hill school of Northampton, Massachusetts. It is not possible to trace accurately the underlying motives of this venture. It was thought by many an attempt to found a German gymnasium in America. But that could not have been the case, because Bancroft has always considered the gymnasium imperfect. There is too much mere teaching, and the system does not call forth that daily mental activity so essential to educated thinking. One thing it certainly was—the first organized endeavor to elevate the secondary schools of the country to the position which belongs to them in the formation of mind and character. A pleasant picture of the life and work at Round Hill is given in Miss Hale's *Life of Thomas Appleton*, who was a pupil there. It is probable that with the general plan of lifting up college work, there was also in view pecuniary reward. Thus far Bancroft had looked for his necessary expenses to an uncle and a brother. With generous haste he sought the shortest road to independence, and hoped the school might be profitable. But a trial lasting for ten years convinced him it could not be made so. Though Cogswell was an able man, the partners were not congenial, and there was friction in the business management. Then, too, the colleges required from students applying for entrance to the higher classes the fees of the lower years. This demand was intended to be, and was, a discouragement from any attempt on the part of that or any other school to carry boys further than the necessary work for admission to the freshman class. The time, however, was not wholly lost, for during the entire period his pen was busy with contributions to the "North American," to Walsh's "American Quarterly," and with a translation of Heeren's most important work. The latter was formally reviewed by the "Edinburgh Review," pronounced by Edward Everett to display "a mastery of two languages," and showed the marks of a fine historic style. It was immediately reprinted in Oxford without

any recognition of the translator, or even the mention of his name on the title-page. During his life in Northampton, moreover, Bancroft became an active member of the Democratic party, attending its conventions, writing its platforms, and guiding its councils in his native State. His first wife was a member of the famous Dwight family, who were Whigs, and at her request he never accepted office, although once elected, in 1830, to a seat in the Legislature without his knowledge, and once, in 1831, requested to accept the nomination for Secretary of State.

The death of Mrs. Bancroft followed closely upon his retirement from the Round Hill school. There were four children by his first marriage, two sons still living, and two daughters who died in infancy. The affectionate consideration for her wishes which had kept him from active political life during the years in Northampton continued after her death until 1837. During those years he devoted himself to literary work, publishing the first volume of his history in 1834 and the second in 1837. But in 1837 he was appointed collector of the port of Boston by Van Buren, and accepted the office. Thenceforward for many years his connection with active politics has been more or less constant, his career as a statesman culminating in the years of his residence as Minister at Berlin.

POLITICAL LIFE.

WHEN he entered upon his duties as collector, the law exacted from importers in payment of duties not cash, but bonds payable on time. A very large part of the whole revenue of the country was then levied in the port of Boston, and the amount of bonds received from the importing merchants during Bancroft's period of office reached to very many millions. All his predecessors, without exception, had left behind them uncollected bonds representing large sums, which have not been collected to this day. Of all those taken in the period of his service, not one that became due was left unsettled, or in arrears, when he retired from the office. Never in a single instance did the President or the Secretary of the Treasury seek to control his use of the appointing power. Among others to whom he had the opportunity of giving public employment was Hawthorne, who received an appointment to the most lucrative office in the gift of the collector. Hawthorne's biographer speaks of him as having remained in the office to the end of Van Buren's administration and having been removed with the rest. This is not true. Hawthorne, who, while in office, fulfilled his duty with the most punctilious exactness and

fidelity, resigned after two or three years, much against the wishes and entreaties of the collector. Another, who took a large part in the philosophical and religious controversies of the time, Orestes Brownson, received a valuable post, which gave him a residence as well as an income.

Many of the Democrats of Massachusetts looked on the policy of annexing Texas as fatal to their existence as a party. Bancroft's opinion to the contrary had been most unpopular, but in the State Convention at Worcester he explained with cogent and convincing arguments the merits and expediency of the measure. He pleaded for the extension of the "area of freedom" (Boston "*Times*," March 2, 1845), contending, as he had done from the first, that the annexation of Texas was a step conducive directly to a diminution of the political influence of slavery. Had Texas remained an independent State it could have imported slaves directly from Africa. By annexation Texas subjected itself to the laws of the United States against the foreign slave trade and stopped completely all increase of slavery from abroad, of which the continuance had so sadly affected South Carolina and Georgia. This view was shared by Robert J. Walker. Will any one consider what would have been the condition of the United States in their great civil war if Texas had been an independent power, exercising all the rights of a neutral nation? Moreover, the acquisition of Texas had rendered it impossible for Mexico to maintain a hold on Alta California, and the annexation of California by the administration of Polk was the death-blow to slavery. Texas had been recognized as an independent power by Great Britain and by France before the United States consented to its annexation.

On Polk's election Bancroft was chosen to represent the New England Democrats in the Cabinet. A man who takes much part in a conflict of opinions is pretty sure to fall among those who add passionate perverseness to passionate convictions. Several such persons in Massachusetts undertook to prevent his confirmation in the Senate as Secretary of the Navy, and for that purpose wrote to Mr. Archer, one of the Senators from Virginia, referring to several published articles in which Bancroft had expressed himself strongly on the subject of slavery, and communicated to him what they had done. What happened in the Senate is well known, because the vote for the injunction of secrecy was soon after removed. When the Senate came to consider the nomination, Senator Archer asked for a postponement of the vote, but not as an opponent. Bancroft's friends immediately con-

sented to pass it over for the day, giving the Senator from Virginia the opportunity which he wanted, to make inquiry. Senator Allen of Ohio came to Bancroft and inquired of him what he had written on the subject of slavery, and received a list of all the articles, with a note of where they could be found. Bancroft said that what he had written he had written from sincere convictions, that they were his opinions when he wrote them and were his opinions still; that if a question was to be raised in the Senate on his opinions on slavery, he must stand upon them as uttered by himself without concession, explanation, or compromise. Allen hunted up the papers and found, as he afterward said, that some points on the subject had been stated with great strength and in words which he perhaps would not have used; but that there was nothing Mr. Bancroft had written that he did not himself accept; and made a vehement speech on the subject in the Senate. But there was really no hesitation; Archer made no objection, and with very little debate Bancroft was confirmed unanimously. The Senator from Virginia, who had raised the inquiry, some days afterward called and led the conversation to the topic of "the institution." Bancroft listened with reserve, upon which the Senator himself broke out into the severest denunciation of slavery which could be uttered, condemning it with an intense sincerity of conviction that only personal observation could have forced upon him, and explained the infinite evil that slavery had done and was doing to Virginia. Whenever Bancroft has been before the Senate, he has never had a single vote against him; in every instance where he has been passed upon in the Senate, his nomination has been confirmed unanimously.

Polk said to one of his Cabinet after the inauguration that the four principal measures of his administration were to be: the settlement of the North-western boundary, the acquisition of California, the establishment of the constitutional treasury, and a tariff for revenue. Bancroft had his full share in these measures so far as they were accomplished while he was in America. As regarded the reduction of the tariff, Mr. Walker of the Treasury Department attended to it, and merits honor for his most successful discharge of the duty; but the Secretary of the Navy warmly approved the measure, and was able to promote the good work. The chairman of the Committee on Ways and Means, who expressed more confidence in Bancroft than in others, came to consult with him on the points on which his own decision would turn, and asked whether the tariff as so greatly reduced would in his judgment produce a sufficient revenue for the expenses of the Government. In reply the opin-

ion was given that it would certainly suffice and probably produce a surplus. He went away satisfied, and supported the bill with his authority as chief on the Finance Committee; and it was triumphantly carried, and proved financially a perfect success.

The establishment of the Naval School was in this wise: Bancroft, having passed much of his life in schools and universities, entered his office of Secretary of the Navy with a wish to establish for the navy a school like that in operation for the army at West Point. It was plain to him that Congress could not be induced in advance to pass a law for the establishment of a naval school, for much opposition would arise from the fear of authorizing a costly establishment; and even if Congress had been favorable to the movement, a controversy would have sprung up as to the place for establishing it, involving sectional as well as local controversies. There was no chance of success but to present to Congress for its approbation a school already established and in full operation; and this he undertook to do in strict conformity to law and without passing beyond the limits of the appropriations already made and at his disposition. In this design he was aided by the President and by his colleagues.

The first question was, Where should it be established? If it had been at the North, the location would have called forth an almost unanimous opposition from the South, as the Military Academy was on the Hudson. Luckily at that time the army was ready to abandon its post at Annapolis. Bancroft requested Secretary Marcy, then in the Department of War, to transfer the post and its public buildings to the Secretary of the Navy. Marcy assented, and the President approved. Bancroft had then to see how he could get together the school, with its superintendent, pupils, and professors, without violating or seeming to violate a law. The law recognized the presence of teachers on board ships at sea; and it was common when ships were sent to sea to order an instructor to the ships. Sometimes an outsider got one of his friends, who wanted a sea voyage for health, put on board a ship, nominally as a teacher or as a chaplain, but no provision was made for the instruction of the young officers on shore; the consequence of which was that on their discharge from a sea voyage, they went where they pleased, at their own free will, and were scattered about in the various cities of the Union, exposed to all the dangers to which young men under twenty, without supervision and without employment, were exposed. So then to a certain extent the instruction of the midshipmen had been provided for by law; where the in-

struction was to be taken was not fixed by law. The Secretary of the Navy could therefore order the young officers to go to Annapolis and be taught, and those employed as professors, to go there and teach, and any high officer of the navy to go there as superintendent. A good many unsuitable teachers were retired from the service, and very able men carefully selected to take their places. Then the young midshipmen, as they returned from a voyage, and the newly appointed midshipmen, were ordered there, and an examination was made requisite for admission, and for advancement.

When Congress met there was a naval school in full operation at Annapolis, where the midshipmen were on duty, and therefore under the discipline of naval law. All the expenses of the school had been paid for out of the various appropriations without the violation of a law. The question came necessarily before Congress, for the building handed over by the War Department to the Navy Department needed considerable repair in order to serve the new purposes thoroughly well. The confidence of the chairman of the Committee of Ways and Means, James J. McKay, was of the greatest importance.* Bancroft followed the progress of the bill for establishing this school with the utmost closeness. No one questioned that he had carefully kept within the law; the House committees and the House approved; resistance in the Senate was threatened; but the Secretary of the Navy was in the Senate the day when the decisive vote was taken, and was gladdened as he saw men of all political parties and from all sections of the country uniting to form a majority for the School. The measure was carried by a very good vote, and once carried, the Naval School was safe.

Among the other great questions which had troubled the country from the establishment of its independence was the settlement of the North-western boundary. After the peace the English refused to surrender the Northern ports, and by the Jay treaty consented only to a joint occupation of the unsettled Western country. This had continued from the days of Washington, to the great advantage of the British and the Hudson Bay Company. The first act of Polk was to renounce the joint occupation of the country over which the agreement had extended. The next immediate consequence was the settlement of the North-western boundary, which

had so long troubled the country and which had been left by preceding administrations as unfinished business. The English at first attempted to inspire terror; but Polk was a man who, without making any pretensions to courage, possessed it in the highest degree both as a man and as a statesman, joined with prudence and circumspection; and Buchanan, the Secretary of State, was able soon to bring the negotiations to a close on the boundary question, and the treaty was signed and ratified in England before the retirement of the Cabinet of which Sir Robert Peel had been at the head.

Polk saw very clearly that the real power of Mexico did not extend over California, and that it could only be safely and securely settled by the United States. To leave the matter loose was to open California to the inroads of private adventurers, or to expose it to the claims of some European power. He was fixed in his purpose to seek its administration by treaty with Mexico; but it soon became certain that Mexico would engage in war to avenge herself against America for admitting Texas as one of her States, although Texas before it was so admitted had been recognized as an independent State by the two leading powers of commercial Europe, by Great Britain and by France. Bancroft watched the course of events, and took the measures which were necessary to secure American ascendancy in California. As Secretary of the Navy he sent out orders so early as the 24th of June, being fully convinced that Mexico intended to go to war, and that not a moment should be lost in securing California. The nature of the orders that were given will be seen best by the following extracts from his letters to the American naval commander in the Pacific, as under those orders possession was taken of California:

"If you ascertain with certainty that Mexico has declared war against the United States, you will at once possess yourself of the port of San Francisco, and blockade or occupy such other ports as your force may permit.

"Yet even if you should find yourself called upon by the certainty of an express declaration of war against the United States to occupy San Francisco and other Mexican ports, you will be careful to preserve, if possible, the most friendly relations with the inhabitants; and, where you can do so, you will encourage them to adopt a course of neutrality." Bancroft to Sloat, June 24, 1845.

"You will consider the most important object to be, to take and to hold possession of San Francisco; and this you will do without fail." Same to same, May 15, 1846.

* "Not only has he" [G. B.] "obtained great celebrity as an essayist and historian, but the policy which he advocated while at the head of the Navy Department gave him the character of an accomplished statesman. While his views were sufficiently enlarged

and liberal, they received the approbation of one of the most ultra economists and reformers in the House of Representatives." [James J. McKay of North Carolina.] "History of the Polk Administration," by Lucien B. Chase, p. 25.

"The Department has received your letter No. 51, of June 6, from which it appears that while you were aware of the existence of 'actual war' between the United States and Mexico, you remained in a state of inactivity and did not carry out the instructions of June 24, 1845, framed to be executed even in the event of the mere declaration of war, much more in the event of actual hostilities. Those instructions you were ordered to carry out 'at once.'

"In my letter of August 5, 1845, the receipt of which you acknowledged on the 28th of January, 1846, referring to them, I said, '*In the event of war*, you will obey the instructions recently addressed to you via Panama.'

"In my letter of October 17, 1845, of which you acknowledge the receipt on the 17th March, 1846, referring to these instructions once more, I said further, '*In the event of actual hostilities between the Mexican government and our own*, you will so dispose of your whole force as to carry out most effectually the objects specified in the instructions forwarded to you from the Department in view of such a contingency.' And surely there is no ambiguity in this language.

"And in my letter of 23d February last, sent through Mexico, I remarked, 'This letter is sent to you overland, inclosed, as you suggest, to Messrs. Mott, Talbot & Co., Mazatlan, and you will readily understand the reserve with which it is written.'

"The Department on August 5, 1845, had also told you that 'your force should not be weakened while hostilities are threatened by Mexico.' Your course was particularly approved in detaining the frigate *Constitution*. The Department will hope that a more urgent necessity than as yet appears existed for the otherwise premature return of that vessel.

"The Department does not charge you with disobedience of orders. It willingly believes in the purity of your intentions. But your anxiety not to do wrong has led you into a most unfortunate and unwarranted inactivity." Same to same, Aug. 13, 1846.

In Curtis's "Life of Buchanan" will be found two letters which are of interest in the same connection, as showing Bancroft's share in the important events connected with the acquisition of California. The first is from Washington, written while he was still Secretary of the Navy; the second was written from London after his appointment as Minister at the Court of St. James.

When the collision about slavery led to civil war, no one was more quick than Bancroft to see the nature of the controversy, and that the only solution would be the abolition of slavery as the result of the war. Twice he delivered orations on that theme in the city of New York, once upon an express vote by the city government, when he examined and controverted the interpretation of the Constitution on which the plea for slavery rested. That speech was perhaps more carefully prepared than anything he had yet printed. After the peace he pursued the same line of argument with all whom he could reach; and the nature of his views will best appear from a letter he wrote to Mr. S. S. Cox, then a member of the House of Representatives from the city of New York, and lately Minister at Constantinople:

"NEW YORK, January 28, 1865.

"MY DEAR MR. COX: You and I stood together with Douglas against the outrageous attempt to force slavery upon Texas. I read your speech the other day, and think your argument perfectly sound, that the removal of slavery may be effected by an amendment of the Constitution. Our friend's question, whether a power exist to establish slavery everywhere, is, *first*, as foolish as to ask if the amendment could be made denying in a bill of rights every one of the commandments, and, *secondly*, the power to establish slavery everywhere was not contemplated by men who formed a union 'to establish justice and secure the blessings of liberty.'

"I write to-day in full recollection of the noble battle which we fought together against the attack on the liberties of Texas. Let me now most earnestly entreat you and advise with you, to record your vote in favor of the amendment of the Constitution for removing the cause of this rebellion.

"It is the part of justice. It is the part of peace; nothing else will quiet the South. When the matter is fixed, they will see what they must renounce, and will acquiesce. The measure is the only one which can restore prosperity to the South; punish slavery and then we can cherish the former slave-holder. The use of slave labor, as you know, locked the gates of the South against the free laborer; remove slavery, and the tide of free labor will rush towards the South with surprising swiftness. In ten years Virginia will be more peopled and richer than she ever was before. Texas will be our Italy.

"We Democrats are right in the coming financial questions, and the country knows it. You cannot present the issue of the finances till the slavery question is settled, and that question can be settled but in one way. Do away with slavery, and the Democrats will be borne into power on the wings of their sound principles of finance.

"You may jar on a few; you will come into public life again if you do but sustain this amendment. The progress of opinion on the subject is truly wonderful; the removal of slavery is now looked upon here as the wisest counsel of conservatism.

"Do not, my friend, let your name be registered as one who defeats this measure. It will stand out to all time; and your children, and your friends, and your political supporters, and you yourself would regret it, almost as soon as your vote should be recorded.

"You know I have no fanaticism. I view this matter calmly, bringing out and applying the rules which history furnishes and which are as fixed and immutable as the laws of the material universe. The path of wisdom, of patriotism, of peace, of future success, leads now through the abolition of slavery by an amendment of the Constitution.

"Listen to what I say, and if you take the advice of one who may plead his age in excuse of his importunity, you will soon own me to be the best friend and counselor you ever had in your life.

"Faithfully yours,

"GEO. BANCROFT."

Throughout the civil war Bancroft was an ardent patriot, and delivered before Congress in February, 1866, a eulogy on the life and career of Lincoln as sympathetic and stately as that which he had pronounced from the porch of the Capitol many years before on the character and services of Jackson. The reconstruction measures of Andrew Johnson met with his hearty support, and in 1867 he was sent as Minister to Berlin to establish the right of the immigrant German Americans to renounce

their old allegiance and accept an exclusive American citizenship. It was against the usage of Germany and against the policy of the War Department of Prussia and all the other North German States. If the German American revisited his old home, he was liable to be seized and forced to do all the military service which, by the laws of Germany, could have been required of him, had he not emigrated. Bancroft was to obtain relief in the case. The argument that weighed much with Bismarck for granting the wish of the United States was, that the Germans in America might not be interrupted in their domestic intercourse with their parents, with their brethren, with the members of their families who remained at home; but the question assumed a special importance, as it was the first time that by a formal act the principle of the renunciation of citizenship at the will of the individual was recognized. But the desire to be on amiable terms with the United States and to promote the continuance of affectionate intercourse between those Germans who had elected the United States for their home and the friends whom they had left behind them prevailed with Bismarck.

The British Minister kept watch over the negotiation, with the determination to abide by the result of the treaty. The first result of Bancroft's success was to relieve German-Americans from military service in Germany. The next good result was immediate; namely, the renunciation by England of her claim to indefeasible allegiance, and to the right to impress into the British service a former British subject who had become an American citizen. The North-western boundary having been settled by treaty, Bancroft, while United States Minister in Great Britain, had perceived an incipient effort of a great English interest to encroach on the territory which had been acknowledged by the treaty to be a part of the United States. Just before the British administration had entered on the design to disturb the recent treaty, he took occasion in a dispatch to that government to make, incidentally, an official statement of the true interpretation of the section, without even a hint that there could be any controversy about it. In that way the passage in the dispatch did not provoke an answer; but there was left in the English archives an official description of what the boundary was under the hand of one who was in the American Cabinet at the time the treaty was made. By and by the importunities of interested persons in England, who

possessed a great party influence, began to make themselves heard, and the British Government by degrees supported the attempt to raise a question respecting the true line of the boundary of the North-west, and finally formulated a perverse claim of their own, with a view to obtain what they wanted as a compromise.

The American administration had of course changed, and the President and his Cabinet, having had no part in the negotiation, agreed to refer the question to an arbiter. They made the mistake of consenting that the arbiter, if there was uncertainty as to the true boundary line, might himself establish a boundary of compromise. The person to whom the settlement of the dispute was to be referred was the President of the Republic of Switzerland. The American Secretary of State chanced to die while the method of arrangement was still inchoate. Bancroft at once wrote to the new Secretary, urging him not to accept the proposal of a compromise, because that would seem to admit an uncertainty as to the American title, and to sanction and even invite a decision of the arbiter in favor of a compromise, and would open the way for England, under an appearance of concession, to obtain all that she needed. Being at the time United States Minister at the court of Prussia, he advised the Government to insist on the American claim in full, not to listen to the proposal for a compromise, but to let each party formulate its claim, and call on the arbiter to decide which was right, and urged it to select for that arbiter the Emperor of Germany. Now the new Department of State had never accepted the plan of settling the dispute by a compromise. They were willing for a reference, if each State would insist, each for itself, on its own interpretation of the treaty. The Department of State at once consented that the referee should be the Emperor of Germany, and left the whole matter of carrying out the American argument to Bancroft. The conduct of the question, the first presentation of the case, as well as the reply to the British, were every word by him, and the decision of the Emperor of Germany was unreservedly in favor of the United States.*

HISTORICAL WORK.

BUT Bancroft's work as an historian is even more important and interesting than his eminent public services. Indeed, to many his career as a statesman and diplomatist will seem almost providential in the opportunities

* This imperfect sketch of Bancroft's public life is necessarily short, but it is believed to be accurate. It is based, as indeed the entire article thus far has been, in part and chiefly on records of conversations between

him and the writer, held at intervals since 1873, and in part on memoranda kindly furnished by Bancroft himself. In the most important matters, the latter have often been used verbatim in this article.

it has given him for examining and collecting the materials upon which his most philosophic, thorough, and painstaking history of American origins has been based. He was, indeed, first led to devote himself to the writing of American history because there was no other field where he could so advantageously apply the principles so important in the use of original authorities. The germination of our national life was scarcely complete when he arrived at manhood, and he lived in the very midst of its growth and development. It is essentially characteristic of Bancroft that he was led to the writing of history by motives of a kind which are not those of the great school of merely artistic historians. Once determined to be a man of letters, after struggles of mind which led to the most thorough self-examination, he set his face toward a single aim. Though much entreated, he wrote next to nothing for the journals and periodical press after his resolution was taken. No doubt his father's "Life of Washington" had some influence in the choice of history from among the various departments of literature, and it will interest believers in heredity to know that a son of his first American ancestor mentioned in his will and made a special provision for "his history-books." But the commanding motive was a regard for history as a discipline of philosophy. The only test of philosophic truth is to examine the collective will of mankind, purged from the conflicting doubts, passions, and emotions of individuals. There is the same conservation of force in the moral as in the physical world; you must, therefore, seek a power universal from all eternity. One great test of Christianity is, that it has the principle which, in spite of any intermixture of human civilization, is the source of all good. This eternal reason, shorn of the imperfections inherent in man, is the infinite, perfect, enduring logos. The Christian incarnation makes practical the doctrine of the Trinity. The spark of the divine in us enables us to arrive at the knowledge of the infinitely perfect, and by what is divine in man we are younger brethren of the Elder Brother, who is all divine. Bancroft's devotion to Kant as well as Edwards is explained by the fact that, meeting the skeptics on their own ground, Kant, still proves the existence of *a priori* truth and of *a priori* synthetic judgments. His standpoint, therefore, as an historian, is that of the newer scientific school, which views history as a unit, its forces as constant, and their manifestations as parts of an organized whole. Every individual must have his place in the picture, but the background is the history of the race.

The next important factor in Bancroft's choice of a profession was beyond a doubt

the influence of Heeren. In fact, if it were not acknowledged frankly as it is, there would be no difficulty in the attempt to trace it. Heeren's great rules were two: first, distinguish between original authorities (*Quellen*) and historical aids (*Hilfsmittel*); second, represent every man from his own stand-point, and then criticise him as much as you choose from yours. Original authorities are those who were on the spot and did or saw what constitutes the facts given or else heard from another who was on the spot. Historical aids may be illustrated, for the sake of example, by the decisions of the Supreme Court in the interpretation of the Constitution. As Bancroft himself has said, the tests of a historian are those of time and place—the when, the where—and of the actor—the by whom. Heeren's method also was a development and ordering of events with a view to the mastery of the whole. He used geography not so much with reference to political divisions as to physical contours and their incidental effects in producing governmental divisions. He was always calm, deliberate, moderate, except on rare occasions, when he could be very emphatic. Once, in speaking of the Spartans at Thermopylæ, he said that some strategists thought they should have retreated, and then grimly and vigorously remarked, "No doubt there would have been a retreat had the critics been in their places."

Bancroft's purpose to devote himself to the history of America was definitely formed before he left Round Hill. The first volume was begun in Northampton, and for the sake of access to books he removed to Springfield and spent the following winter in Boston, where he worked in the State Library, in the Athenæum, and at Cambridge. The same plan and thoroughness characterize his earliest work as much almost as that of his ripest years. He seems to have gone at everything exhaustively; certainly, his readers will testify that he spared no pains. He read with care in order to form his style, as extensively, in all likelihood, as even Prescott. The works of Burke were always near at hand. Milton has, however, always been his solace and delight. He is said to know by heart "L'Allegro," "Il Penseroso," "Comus," and "Lycidas," and long passages from the "Paradise Lost." He also read Bacon constantly. In conversation I have heard him wonder how Milton could have leaned to Arianism when he had a mind too great to write prose, or how Bacon could have ever shown such weakness for the world as to be at times the miserable temporizer that he was: he was one of the wisest men that ever lived. Harriet Martineau had a solid foundation for the remarkable characterization of

Bancroft's work even in its inception. She says : * " The Americans have also a historian of promise. Mr. Bancroft's ' History of the United States ' is little more than begun, but the beginning is characterized by an impartial and benevolent spirit, and by the indications which it affords of the author's fidelity to democratic principles : the two primary requisites in a historian of the republic. The carrying on the work to a completion will be a task of great toil and anxiety, but it will be a most important benefit to society at large, if it fulfills its promise."

The work was successful from the beginning because it was done in a spirit so sincere and philosophical. It met with a reception which was most gratifying at home, and in Europe its popularity was remarkable. The first three volumes were translated into Danish, Italian, and German by translators who obtained the author's permission. It was done into French without his knowledge, and sent into the South American colonies to further the awakening spirit of Liberty. There was a Scotch edition in two volumes and an English one on which the author received copyright royalty until the courts decided that as an American he was not entitled to it. It was natural, therefore, that when Bancroft went to England as Minister he was warmly received by both men of letters and the historic families. It was while visiting at the great houses that much of his material was collected. Lord Lansdowne in particular gave him free access in his own house to the whole of Lord Shelburne's papers. He was intimate with Peel and Palmerston and knew both Disraeli and Gladstone, who was at that time the great gladiator of the House. Bancroft had in the mean time married again. His second wife, who lived to a ripe old age and died only a few months since, was the daughter of a distinguished and wealthy merchant of Boston and a woman of remarkable education and charming manners. In every way a suitable and helpful companion to her distinguished husband, their life in England was a social triumph throughout. When they left, Macaulay gave a breakfast to Mrs. Bancroft at the Albany, the only instance of such an attention on his part to any lady.

It was the habit of Milman, Hallam, Macaulay, and Lord Mahon to breakfast together once a week. Bancroft was nearly always with them. The intercourse of those meetings was intimate and delightful, in spite of the widely different characters of the friends and their still more varying ability. Lord Mahon's History has already fallen into the oblivion which it merits. Hallam's work, though often

rousing opposition as to its conclusions, is as sincere and thorough as his character was lovely. Dean Milman has taken his place among the masters of history. Macaulay's researches were made in the fairest spirit, and his memory was of course phenomenal, but his strong prejudices being a part of himself, his History is but a great epic of the rise, growth, and triumph of the Whigs. Its dazzling qualities will certainly insure its immortality as a splendid literary creation and prolong the renown of its author. He was a magnificent painter, but no believer in a philosophy of history or in philosophical history. In Bancroft's work there lie the qualities of permanency, and so long has it been before the world and stood the test of critical examination that we might almost say the judgment of posterity had already been pronounced.

During his term of office in London, Bancroft was accustomed to spend two months of every winter in Paris, where he made many friends. It was then he first met Thiers, of whom he once asked how many republicans there were in Paris. " Just as many as there are of your compatriots," was the reply. When they met again in 1867, the first words Thiers uttered were, " Ah, Mr. Bancroft, you will find many more republicans in France now than when you last were here." It was during these first visits to Paris that Bancroft's collections from archives first began to take form. From 1830 he had collected original domestic papers and letters from all possible sources. But the famous collection of state papers from the French archives, since published by his early friend the Comte de Circourt, whose countess had what is considered the last of the famous French *salons*, was begun and completed through the influence of friends made at that time. When offer of payment for the work was made, the answer was, " Oh, no, we have a lot of young men here whom we have in training ; it will be good practice for them." On the other hand, the English Foreign Office and our own State Department have a fixed charge for all such work. Of original and copied documents there are in Bancroft's library five hundred and more bound volumes. Besides the copies from the American, English, and French archives, there are others from those of Austria, Holland, Spain, and Russia. This is, of course, exclusive of the twelve thousand printed volumes which form his proper working library.

While therefore Bancroft's mission to England was marked by no diplomatic work of commanding importance, it was nevertheless most influential in his literary career by reason both of the opportunities he had for contact with great minds and for forming his collec-

* " Society in America," II. p. 212.

tion from public and private archives in England and France. The most of his fourth and fifth volumes was written in London, and in 1849 he was made Doctor of Common Laws by the University of Oxford. On his return to America he settled in New York, where he continued to live for many years. Surrounded by the materials he had gathered with such care and from the very fountain-head, he put forth volume after volume of his exhaustive work. In 1860 appeared the eighth volume, which brought the history to the outbreak of the Revolution, and the ninth in 1866. The literary circle of New York was most kind in its welcome of the historian, but the most cherished of all his friends during that period with whom he constantly associated in close and intimate intercourse was the late Professor Henry B. Smith. A man of untiring industry and great ability, his mind was stored with treasures from the thought of the world, and in particular he was versed as few Americans have been in the intricacies of German thought. In his clear comprehension of the force of ideas and the devout spirit with which he approached the study of all human interests, Bancroft found a congenial sphere of thought, and their relations were a mutual solace and refreshment amid the arduous labors of both. Their religious views, moreover, were very similar, slight and unimportant differences only serving to heighten the interest with which they discussed and often molded the thought of our day on the most vital questions in their peculiar spheres.

It would be impossible to give any adequate idea of the literary life of Berlin during the period which includes the years from 1868 to 1874 without constant reference to the part which the United States Minister had in that life. The connection between the literary and political circles of Berlin is very close. The Government has a just pride in its most famous university, and finds a return for its lavish expenditure in the services which the distinguished professors ungrudgingly render in every direction, but especially in those of public and private law and as legislators in the Prussian and Imperial Parliaments and in the city councils of Berlin. In fact, this connection is traditional. Macaulay sneers at the father of Frederic the Great and regards his "beer-congresses" as orgies. Bancroft says they were no such thing. The king was a Calvinist; he wished to keep down taxation, and lived, therefore, with the frugality of a private man. But he invited to meet him and chose as his friends the greatest men of the day in letters and science. They met around a long table, each with his pipe and his can of beer, and there the king listened to the most splen-

did theories which the thought of the day could offer. It was to this Calvinism that Prussia's great advance was due. Where Calvinism is, there is liberty. Calvinism depends on no dynasty; Lutheranism depends on princes. The system of civil service instituted by Frederic William I. was the finest in Europe, and endures in great part to this day. While, therefore, the court and diplomatic circles are among the most ceremonious of Europe, there is an inner circle where letters and statesmanship combine as probably nowhere else in the world. And of that circle Bancroft for many reasons became a member. He was found at the private entertainments of the palace when no other foreign diplomat was invited. He often took his horseback rides with Bismarck and visited him in the retirement of his own home at Varzin, where no member of the diplomatic corps except Bancroft was ever received. Having pointed out Moltke's greatness as a captain in a former introduction to his ninth volume, the great general gave in return his hearty and sincere friendship. And of the closer literary and scientific circle Bancroft's house and table were a constant meeting-place. Helmholtz, Mommsen, Droysen, Dörner, and all the rest were constantly there. It was in great measure due to this intimacy with the foremost men in the formative period of German unity that he lost the friendship of many who had before received him with regard in France. During the Franco-Prussian war he celebrated the fiftieth anniversary of his graduation at Göttingen. Among other congratulations was a telegram from Bismarck in the field. To this he replied in the following letter:

"BERLIN, September 30th, 1870.

"MY DEAR COUNT: I was equally surprised and delighted that while you are tasked with the work of renovating Europe, you yet found time to send me lately a friendly congratulation on my being spared so long. It is indeed a great happiness to survive till these times, when three or four men, who loved nothing so much as peace, and after long and hard service were only seeking to close their career in tranquillity, win during a war of defense more military glory than the wildest imagination conceived of, and in three months bid fair to bring the German hope of a thousand years to its fulfillment.

"So I gratefully accept the good-will conceded to my old age; for old age, which is always nearest to Eternity, is this year mightiest on earth, this German war being conducted to its ends by the aged. You, to be sure, are young; but Roon must be classed among the venerables; Moltke is within twenty-three days as old as I am; and your king in years and youthfulness excels us all. May I not be proud of my contemporaries? Retain for me your regard in the little time that remains to me. I am ever, my dear Count, most sincerely yours,

"GEORGE BANCROFT."

Bismarck gave the letter to the German press. It was translated back into English

and printed in the London "Times," read by the French, and contained to their irritated minds a meaning which was never in the writer's thoughts.

No man ever celebrated a greater triumph than Bancroft in the last days of his life in Berlin. Souvenirs and mementos poured in from the emperor, empress, and the court, while his friends vied in doing him honor. The Royal Academy gathered for an unwonted purpose—to give him a farewell dinner, where words of affection and appreciation were spoken by the aristocracy of German letters to the great representative of America. Finally the universities of Munich, Berlin, and Heidelberg united in a farewell greeting, the words of which contain sentiments which might satisfy the most soaring ambition.

"Your name is the intellectual possession of every one among us. You have contributed to the more complete understanding of the problems set for a free people in that, as one of the foremost historians, you have portrayed those immortal deeds which led to the rise of a great free State beyond the sea, and which will find in every age a response in the hearts of free-minded men. We feel a just pride that you may be numbered among those who most thoroughly appreciate German science. . . . We can recall with satisfaction your name to prove that as the representative of the United States you combined the spirit of true scientific procedure with the insight of a statesman."

There follow a few more paragraphs in the same style, and the document is signed by over ninety professors.

The years since 1874 have been spent in Washington and Newport. They have been probably the most laborious of his life. The same habits of work, which in the midst of and throughout his public life enabled him still to find time for writing, continue even now. Rising about five, he seats himself at his desk and prepares the work of the day. About seven a light breakfast is set at his side and eaten without interrupting the course of work. At eight his secretary arrives, to find an ample day's task arranged before him. Dictation, revision, verification of authorities continue till two in the afternoon, luncheon, if any, having been brought in like the breakfast. Then follow the two hours of outdoor exercise, walking, driving, or more likely riding, with which no hindrance of weather or anything except sickness is permitted to interfere. The rest of the day, till ten, is given to social intercourse. Bancroft's method of composition is the most laborious and painstaking conceivable. He hoped, of course, to have come much further, and believes our history can be written down to 1865. But he has

sacrificed all to thoroughness. From every available source the facts are selected, verified, and copied into day-books, of which there is one for every year with several capacious pages for every day. Then the historical aids are gathered on every hand. Having made himself thoroughly familiar with both, he dictates a text, which is immediately revised and corrected by his own hand, copied by a clerk, and laid away. Oftentimes seven revisions and corrections of important passages have been made before the copy reached the printer. Here is an example of his tirelessness recently given in a leading newspaper:

"The whole subject of Indian customs, manners, etc., has been developed through the labors of antiquarians, within, say, the past twenty years. Little was known at the time Mr. Bancroft wrote the earlier volumes of his history, and the account given there of the aborigines was necessarily written with limited knowledge. When he began the present revision—in which he is pruning off remorselessly many of the flowers of rhetoric with which he adorned and perhaps over-adorned the pages in his younger days—he secured the coöperation of the most learned Indian ethnologist in the country. The book was critically examined on this topic, and every deficiency sternly brought to view. Then Mr. Bancroft set to work to master the subject for himself, and when he had read every book and periodical article he could find in the Congressional Library, and every book he could buy, he felt that he could venture to write upon it."

During this last period the "History of the Constitution," in two volumes, has been written, and an exhaustive revision of his entire work in the light of our latest knowledge has been given to the public; and at present he is as busy with his gigantic task as ever, recording the work of the early administrations and his estimate of the relative powers of the great statesmen who guided us in the dark, groping period of our national life. Ranke used to say that he worked on his Universal History from pure laziness, because he had nothing else to do; and though it was a fine paradox, it was true. But Bancroft has plenty to do outside of his routine. He has time to preside over the American Historical Society and retain a lively interest in his friends. His constant watch on all new movements in politics and science is proved by the pamphlet on the legal-tender decisions of the Supreme Court, which appeared but a short while since, and by the articles he sends from time to time to the magazines. He is still alert and ready; his library is constantly enriched by the newest books; and while performing literary feats that scarcely find a parallel, he can still retain seat in the saddle, which augurs well for the preservation of life and the prolongation of work.

William M. Sloane.

TOPICS OF THE TIME.

A Tyranny that cannot Live in America.

FAMILY and other similar influences are, no doubt, a potent factor still in England and other countries of Europe in securing advancement, but they have been losing ground steadily for a century past. Merit is continually gaining force at the expense of other influences, and every year makes a stronger contrast to the state of affairs a hundred years ago. Then the private soldier had no hopes of rising; the officer grounded his hopes of promotion on the power of his family, on the length of his purse, on the superior immorality of the influences which he could bring to bear, on almost anything, in short, except his usefulness to the state. The English army was probably about the best of all; but what a picture does Junius draw of its system of promotion! "If it be generosity to accumulate in his own person and family a number of lucrative employments; to provide at the public expense for every creature that bears the name of Manners, and, neglecting the merit and services of the rest of the army, to heap promotions upon his favorites and dependents, the present commander-in-chief is the most generous man alive. . . . If the discipline of the army be in any degree preserved, what thanks are due to a man whose cares, notoriously confined to filling up vacancies, have degraded the office of commander-in-chief into a broker of commissions?" "In emergencies," wrote Lord Grenville, bitterly, "we have no general, but some old woman in a red ribbon." Wellington's dispatches show how powerful extraneous influences were in the English appointment system; who is to describe that of Prussia or Austria or Russia?

Into this placid system of favoritism there entered a whirlwind in the shape of the French Republican armies. Here favoritism was at a heavy discount; the rise of the sons of tavern-keepers, butchers, and tailors to be victorious generals, dukes, and princes, and even petty kings, paled before the career of the little Corsican lieutenant of artillery, who in ten years fought his way to the empire of a continent. Every French soldier, it was said, carried the baton of a marshal of France in his knapsack. His advancement was limited only by his opportunities or his abilities, and he fought as no other private soldier had yet fought. He was obedient, for he expected some day to command. He was ingenious, inventive, reckless of danger, indifferent to privation or physical suffering: what were such obstacles as these to a man who had before him a constant hope of securing their highest rewards? And in the ceaseless wreck of military reputations which for years kept the easy-going courts of Europe in almost continual mourning, it was the French soldier rather than the French general who did the work.

Since the French revolutionary epoch, its cardinal lesson has been ground into the armies of Europe not only, but into every department of administration and industry the world over. Civil-service reform is but

a small phase of a far larger process. It has been found by experience that all the work of a people is done better and more efficiently according as the individual is spurred on by the highest hopes of individual advancement as his personal reward. Every rise of a rail-splitter to the presidency stimulates a multitude of friendless boys to rely on their unaided efforts. Every rise of a workman to be a manufacturer and employer stimulates a multitude of workmen to higher endeavors and keener foresight. Every appointment to a judgeship on merit alone stimulates a multitude of lawyers to harder work and greater devotion to the public interests. The tendency has not been, as a certain class of minds is fond of representing it, an empty worship of Demos, a sop to the credulous vanity of the people; it is due to the people's instinctive perception of the fact that equality of opportunity brings a differentiation of natural abilities, and secures to the state the best results of the greatest natural powers.

All classes of society, with a single exception, have learned the lesson thoroughly, and applied it; organized labor alone refuses to admit its truth, and strives to resist its application. A fundamental object of the English trades-unions has always been to cut out high individual ability from having any influence on the question of wages; and the American trades-unions, as they develop, show the same tendencies as their English prototypes. Mr. Thornton and Sir William Erle's British Commission of 1867 have collected a mass of testimony, documentary and otherwise, which has never been contradicted or explained away. The unions struggle against piecework, unless the additional wages be divided among the workmen of the room or shop. They forbid a workman of one trade to do a stroke of work in another, no matter how pressing the necessity or how great the consequent loss. They encourage the ordinary workman's instinctive repulsion to improvements in machinery, or the use of more powerful natural agencies. "Not besting one's mates" has by several unions been made the subject of special enactment. "You are strictly cautioned," said a by-law of the Bradford Bricklayers' Laborers, "not to overstep good rules by doing double work, and causing others to do the same, in order to gain a smile from the master. Such foolhardy and deceitful actions leave a great portion of good members out of employment. Certain individuals have been guilty, who will be expelled if they do not refrain." The Manchester Bricklayers' Association had a rule providing that any man found running, or working beyond a regular speed, "shall be fined two shillings and sixpence for the first offense, five shillings for the second, ten shillings for the third, and if still persisting shall be dealt with as the committee think proper." At Liverpool a bricklayer's laborer might legally carry as many as twelve bricks at a time. Elsewhere ten was the greatest number allowed. But at Leeds, "any brother in the union professing to carry more than the common number, which is eight bricks, shall be fined one

shilling"; and any brother "knowing the same, without giving the earliest information thereof to the committee of management, shall be fined the same." During the building of the Manchester Law Courts, the bricklayers' laborers struck because they were desired to wheel bricks instead of carrying them on their shoulders.

All this has been within public knowledge for twenty years; the professed advocates of the unions have never denied its truth or announced any reformation, but have contented themselves with pointing out asserted parallel restrictions in the professions; and every American employer who has much to do with the unions knows that the American unions go as far on the same road as they see a possibility of success. It is within a few months that the workmen in a New York jewelry factory struck and compelled their employers to give up all phases of the piece-system. Every labor journal contains letters denouncing some arrangement to enable smart workmen to earn higher wages as a scheme of the bosses to grind the faces of the ordinary workmen; every invention is an item in this supposed conspiracy, and every workman who takes charge of a labor-saving machine is regarded as a party to it. The rules of the union are the product of a majority vote, and what chance has the smart, capable workman of influencing the majority vote? It is the "smart," pipe-laying demagogue who controls the majority vote; and his surest chance of doing it is to support rules which seem to the ordinary workman likely to obtain for him the same wages as the workman of exceptional abilities. If it cannot yet be said with truth that the cardinal object of the unions is to secure entire uniformity of wages to all workmen, good and bad alike, it is quite safe to say that no rules have so enthusiastic support from the unions as those which seem likely to bring about that result; and that no men have so little influence with the unions as those who seem likely to impede such a result.

In the long run, such a tendency is most injurious to those whom it professes to benefit. The unions have not yet come, except by indirection, to dispute the right of the employer to discharge whom he pleases when decrease of work compels a reduction of force. Suppose wages are reduced to a condition of entire equality, and the exasperating spectacle of extra or higher wages has disappeared; who shall be chosen for discharge when a reduction of force becomes necessary? Evidently the less efficient workmen, and the more efficient workmen are retained, and that at the average wage. The poor workman has reaped no enduring advantage; the good workman, reduced to a cart-horse round of hopeless labor, does not and cannot show the best that is in him; and the employer, hampered by unnatural restrictions, cannot do his work with advantage, or put himself into a position where the unions can use the striking power with any prospect of permanent success. The system injures everybody concerned, and yet it seems to be an inevitable accompaniment of the irresponsible majority vote of the unions.

But, though the poor workman reaps no permanent gain from the system, the good workman does incur a permanent loss. It is altogether against his interest to enter any such organization, conducted as it is on principles opposed to all the current of the world's

development for the past century. It is a return to the family politics and favoritism of the last century, the favor of the union taking the place of the favor of the government. Each is as fatal to real individual ability as the other. What, then, shall we say of the methods by which skilled workmen are forced into such organizations, of the cry of "scab," of the pelting and beating, the maimings, even the murders, by which examples are made to guide the decision of workmen as yet untested, of the persecution of wife and children, by which life is made a burden until the union is entered? A demand on a skilled workman for a percentage of his wages for the benefit of his less capable associates might at least be not intolerable: the additional burden might be an incitement to more than equivalent exertions, and a real increase of wages. But here he is forced into a system under which he must bear the burden without any hope of recouping it by extra exertions. Is this organized labor, or organized robbery?

No more important or excellent work can be done by labor organizations than that of teaching their indifferently members that they and their children have a personal advantage, not a personal injury, in the superior capacity of some of their comrades. And, if the lesson be not taught or not heeded, public opinion must speak promptly and emphatically in condemnation of the injury which its skilled labor is daily receiving at the hands of unworthy men. Labor is the life of the country; and he who dishonors it with this opprobrious name of "scab" is the lineal descendant of the slave-driver of ante-bellum times; their community of feeling is due to almost exactly similar reasons.

We believe that no periodical of the kind has paid more attention than has *THE CENTURY* to the labor question, or shown greater sympathy with all who work. But we shall never cease to protest against tyranny, whether exercised by combined capital or by combined labor. And we shall do all we can to hasten the day when these imported methods of keeping down laboring men to a dead level of energy and opportunity shall be utterly eliminated. The Statue of Liberty at the gate of the new world will be a shameful fraud if the first principles of individual freedom are to be defied by the very men who should most jealously guard the liberty which our Constitution guarantees to every American citizen. What the workingmen need to-day is not leaders who preach the gospel of the dead level, or flaunt before their eyes doubtful theories and panaceas of "reform," but rather leaders of the type of Lincoln, who study their needs, sympathize with their burdens, and illustrate in their own lives the upward path of free, honorable, and self-respectful labor. The dead Lincoln is a better leader than the live theorist or demagogue.

The Blot on the 'Scutcheon.

IF one hour is ever more timely than another to sue for justice, there are strong reasons why the opening of the present session of Congress is an especially fortunate time for one more effort, in the long series of efforts which American writers have made, to obtain from Congress a just and adequate recognition of the property of an author in the product of his brain. Among these reasons are:

1. The subject was never so generally understood as

now. During the past year the work of the American Copyright League, for three years ably carried on under the secretaryship of Mr. G. P. Lathrop, has made, under the efficient direction of his successor, George Walton Green, Esq., marked and practical progress, both in the general forwarding of the reform and in the forcible presentation to the attention of Congress of a simple and workable measure. The press of the country—which, from the establishment of the League, has borne a most honorable part in the movement—has responded with vigorous aid to the latest calls upon it. The merits of the reform have been made clear to President Cleveland, and he has added his exhortation to those of his predecessors for speedy attention to the subject. The committee of the League, representing the large body of American authors, has advanced the reform by the spirit of friendliness which it has exhibited toward other interests, while at the same time it has very properly declined to consider it a part of its duty to urge their case; nor has anything been done to impair the confidence of the writing fraternity that its interests and honor are in safe and prudent hands. For the first time in the history of the movement a full hearing has been accorded to authors as such by a committee of Congress. In the conference which was held before the Senate Committee on Patents in January last, the League was fortunate in having for its chief spokesman an advocate who—to the credit of the guild of authorship, be it said—was in nothing more entirely their representative than in demanding the reform on the highest ground of morality. By those whose political code never rises above the stop-gap theory, Mr. Lowell would perhaps be called derisively an idealist. It is not the provision for the present emergency which enlists his interest, but the final establishment of the principle involved. He is not one of those (to quote his own words)

“Whose love of right is for themselves
And not for all the world”;

and as ideality always excites emulation (and sometimes blushes), his resolute speech before the committee put the question on a higher plane in the minds of his hearers, and, along with the reinforcements of other friends of the reform, has advanced the cause to the point where it can no longer be ignored by Congress. Another practical result of the conference is that it has committed to the principle of International Copyright the chief body from which opposition to the principle was to be expected; so that, if we except a theorist or two of inherited economic squint, all parties concerned have now virtually declared themselves before Congress in favor of the reform. It is therefore difficult to see how—without unpatriotic, almost criminal indifference on the part of Congress—the requisite legislation can be postponed beyond the present session.

2. Another reason for prompt action lies in the fact that during the past year the rest of the civilized world has put the seal of shame upon us anew by uniting, at the Berne Copyright Conference, in an international arrangement which is at once the most definite recognition and complete protection of literary property in existence. From this honorable compact the United States Government alone has excluded itself, the State Department not having felt at liberty to commit itself

to a convention the subject of which was at the time prominent before Congress in the form of the copyright bill of Mr. Dorsheimer. During the past summer England, in addition to her action with the other powers, adopted a comprehensive, and in the present condition of English affairs, a most statesmanlike, measure of intercolonial copyright, superseding all her previous legislation and making uniform for the mother country and her dependencies the provisions relating to the ownership of copyright property. In both compacts the way is left open for us to obtain their advantages at any time. That the present shameful condition of affairs is not likely to exist for many years longer is evident from the daily increasing injury it entails upon the legitimate book trade. When would be a better time to terminate it than now? The committee of the Senate has with most praiseworthy interest and patience heard all sides of the copyright question and is probably ready to report. *Why should it not report both bills to the Senate* and let us have a full, free, and final consideration of a subject which, with the most honorable support from the cultivated classes, has never yet reached in the Senate the point of discussion on its merits? This is all that the friends of the League bill have asked, and this, it seems to us, is not an unreasonable demand. It is to be hoped that no senator will be found who will not be willing to devote time and attention to the practical consummation of so good a cause, and that the measure will not be left till the last of the session, to be swept aside by the appropriation bills.
